BiocGenerics-package

Description

S4 generic functions needed by many Bioconductor packages.

Details

We divide the generic functions defined in the BiocGenerics package in 2 categories: (1) functions already defined in base R and explicitly promoted to generics in BiocGenerics, and (2) Bioconductor specific generics.

(1) Functions defined in base R and explicitly promoted to generics in the BiocGenerics package:

Generics for functions defined in package base:

- BiocGenerics::append
- BiocGenerics::as.data.frame
- BiocGenerics::as.vector
- BiocGenerics::cbind, BiocGenerics::rbind
- BiocGenerics::do.call
- BiocGenerics::duplicated, BiocGenerics::anyDuplicated
- BiocGenerics::eval
- Extremes: BiocGenerics::pmax, BiocGenerics::pmin, BiocGenerics::pmax.int, BiocGenerics::pmin.int
- Funprog: BiocGenerics::Reduce, BiocGenerics::Filter, BiocGenerics::Find, BiocGenerics::Map, BiocGenerics::Position
- BiocGenerics::get, BiocGenerics::mget
- BiocGenerics::grep, BiocGenerics::grepl
- BiocGenerics::is.unsorted
- BiocGenerics::lapply, BiocGenerics::sapply
- BiocGenerics::lengths
- BiocGenerics::mapply
- BiocGenerics::match
- BiocGenerics::nrow, BiocGenerics::ncol, BiocGenerics::NROW, BiocGenerics::NCOL
- BiocGenerics::order
- BiocGenerics::paste
- BiocGenerics::rank
- BiocGenerics::rep.int
- BiocGenerics::rownames, BiocGenerics::rownames<-, BiocGenerics::colnames, BiocGenerics::colnames<-
- Sets: BiocGenerics::union, BiocGenerics::intersect, BiocGenerics::setdiff
- BiocGenerics::sort
- BiocGenerics::start, BiocGenerics::start<-, BiocGenerics::end, BiocGenerics::end<-
- BiocGenerics::width, BiocGenerics::width<-
- BiocGenerics::subset
• BiocGenerics::table
• BiocGenerics::tapply
• BiocGenerics::unique
• BiocGenerics::unlist

Generics for functions defined in package **utils**:

• BiocGenerics::relist

Generics for functions defined in package **graphics**:

• BiocGenerics::boxplot
• BiocGenerics::image

Generics for functions defined in package **stats**:

• BiocGenerics::density
• BiocGenerics::residuals
• BiocGenerics::weights
• BiocGenerics::xtabs

Generics for functions defined in package **parallel**:

• BiocGenerics::clusterCall, BiocGenerics::clusterApply, BiocGenerics::clusterApplyLB, BiocGenerics::clusterEvalQ, BiocGenerics::clusterExport, BiocGenerics::clusterMap, BiocGenerics::clusterSplit, BiocGenerics::parLapply, BiocGenerics::parSapply, BiocGenerics::parApply, BiocGenerics::parRapply, BiocGenerics::parCapply, BiocGenerics::parLapplyLB, BiocGenerics::parSapplyLB

(2) Bioconductor specific generics:

• annotation, annotation<-
• combine
• dbconn, dbfile
• fileName
• normalize
• organism, organism<-, species, species<-
• plotMA
• plotPCA
• score, score<-
• strand, strand<-, invertStrand
• updateObject

**Note**

More generics can be added on request by sending an email to the Bioc-devel mailing list: http://bioconductor.org/help/mailing-list/

Things that should NOT be added to the **BiocGenerics** package:

• Internal generic primitive functions like `length`, `dim`, `dim<->`, etc... See ?InternalMethods for the complete list. There are a few exceptions though, that is, the **BiocGenerics** package may actually redefine a few of those internal generic primitive functions as S4 generics when for example the signature of the internal generic primitive is not appropriate (this is the case for BiocGenerics::cbind).

• S3 and S4 group generic functions like **Math**, **Ops**, etc... See ?groupGeneric and ?S4groupGeneric for the complete list.

• Generics already defined in the **stats4** package.

The Bioconductor Dev Team

See Also

- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `setGeneric` and `setMethod` for defining generics and methods.

Examples

```r
annotation

# List all the symbols defined in this package:
ls('package:BiocGenerics')

annotation          Accessing annotation information

Description

Get or set the annotation information contained in an object.

Usage

annotation(object, ...) 
annotation(object, ...) <- value

Arguments

object An object containing annotation information.
...
value The annotation information to set on object.

See Also

- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `annotation.eSet-method` in the Biobase package for an example of a specific annotation method (defined for eSet objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

```r
annotation
showMethods("annotation")

library(Biobase)
showMethods("annotation")
selectMethod("annotation", "eSet")
```
Append elements to a vector-like object

Description

Append (or insert) elements to (in) a vector-like object.

NOTE: This man page is for the append S4 generic function defined in the BiocGenerics package. See ?base::append for the default method (defined in the base package). Bioconductor packages can define specific methods for objects (typically vector-like or data-frame-like) not supported by the default method.

Usage

append(x, values, after=length(x))

Arguments

x The vector-like object to be modified.
values The vector-like object containing the values to be appended to x. values would typically be of the same class as x, but not necessarily.
after A subscript, after which the values are to be appended.

Value

See ?base::append for the value returned by the default method.

Specific methods defined in Bioconductor packages will typically return an object of the same class as x and of length length(x) + length(values).

See Also

• base::append for the default append method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• append,Vector,Vector-method in the S4Vectors package for an example of a specific append method (defined for Vector objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

append # note the dispatch on the 'x' and 'values' args only
showMethods("append")
selectMethod("append", c("ANY", "ANY")) # the default method
as.data.frame

Coerce an object into a data frame

Description

Function to coerce to a data frame, if possible.

NOTE: This man page is for the as.data.frame S4 generic function defined in the BiocGenerics package. See ?base::as.data.frame for the default method (defined in the base package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

as.data.frame(x, row.names=NULL, optional=FALSE, ...)

Arguments

x
The object to coerce.

row.names, optional, ...
See ?base::as.data.frame for a description of these arguments.

Value

A data frame.
See ?base::as.data.frame for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

• base::as.data.frame for the default as.data.frame method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.

• as.data.frame,DataFrame-method in the S4Vectors package, and as.data.frame.Ranges-method in the IRanges package, for examples of specific as.data.frame methods (defined for DataFrame and Ranges objects, respectively).

• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

as.data.frame # note the dispatch on the 'x' arg only
showMethods("as.data.frame")
selectMethod("as.data.frame", "ANY") # the default method
as.vector  

Coerce an object into a vector

Description

Attempt to coerce an object into a vector of the specified mode. If the mode is not specified, attempt to coerce to whichever vector mode is considered more appropriate for the class of the supplied object.

NOTE: This man page is for the as.vector S4 generic function defined in the BiocGenerics package. See ?base::as.vector for the default method (defined in the base package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

as.vector(x, mode="any")

Arguments

x      The object to coerce.
mode   See ?base::as.vector for a description of this argument.

Value

A vector.

See ?base::as.vector for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

• base::as.vector for the default as.vector method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• as.vector,Rle-method and as.vector,AtomicList-method in the S4Vectors and IRanges packages, respectively, for examples of specific as.vector methods (defined for Rle and AtomicList objects, respectively).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

as.vector  # note the dispatch on the 'x' arg only
showMethods("as.vector")
selectMethod("as.vector", "ANY")  # the default method
Description

Produce box-and-whisker plot(s) of the given (grouped) values.

NOTE: This man page is for the boxplot S4 generic function defined in the BiocGenerics package. See ?graphics::boxplot for the default method (defined in the graphics package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

boxplot(x, ...)

Arguments

x, ... See ?graphics::boxplot.

Value

See ?graphics::boxplot for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

- graphics::boxplot for the default boxplot method.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- boxplot.FeatureSet-method in the oligo package for an example of a specific boxplot method (defined for FeatureSet objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

boxplot
showMethods("boxplot")
selectMethod("boxplot", "ANY") # the default method
**cbind**

Combine objects by rows or columns

**Description**

cbind and rbind take one or more objects and combine them by columns or rows, respectively.

NOTE: This man page is for the cbind and rbind S4 generic functions defined in the BiocGenerics package. See ?base::cbind for the default methods (defined in the base package). Bioconductor packages can define specific methods for objects (typically vector-like or matrix-like) not supported by the default methods.

**Usage**

```r
cbind(..., deparse.level=1)
rbind(..., deparse.level=1)
```

**Arguments**

... One or more vector-like or matrix-like objects. These can be given as named arguments.

deparse.level See ?base::cbind for a description of this argument.

**Value**

See ?base::cbind for the value returned by the default methods.

Specific methods defined in Bioconductor packages will typically return an object of the same class as the input objects.

**See Also**

- base::cbind for the default cbind and rbind methods.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- cbind.DataFrame-method in the S4Vectors package for an example of a specific cbind method (defined for DataFrame objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

**Examples**

```r
cbind  # note the dispatch on the '...' arg only
s showModal("cbind")
selectMethod("cbind", "ANY")  # the default method

rbind  # note the dispatch on the '...' arg only
showMethods("rbind")
selectMethod("rbind", "ANY")  # the default method
```
clusterApply

Apply operations using clusters

Description

These functions provide several ways to parallelize computations using a cluster.

NOTE: This man page is for the `clusterCall`, `clusterApply`, `clusterApplyLB`, `clusterEvalQ`, `clusterExport`, `clusterMap`, `clusterSplit`, `parLapply`, `parSapply`, `parApply`, `parRapply`, `parCapply`, `parLapplyLB`, and `parSapplyLB` S4 generic functions defined in the `BiocGenerics` package. See ?parallel::clusterApply for the default methods (defined in the `parallel` package). Bioconductor packages can define specific methods for cluster-like objects not supported by the default methods.

Usage

```r
clusterCall(cl=NULL, fun, ...)
clusterApply(cl=NULL, x, fun, ...)
clusterApplyLB(cl=NULL, x, fun, ...)
clusterEvalQ(cl=NULL, expr)
clusterExport(cl=NULL, varlist, envir=.GlobalEnv)
clusterMap(cl=NULL, fun, ..., MoreArgs=NULL, RECYCLE=TRUE,
          SIMPLIFY=FALSE, USE.NAMES=TRUE,
          .scheduling=c("static", "dynamic"))
clusterSplit(cl=NULL, seq)
parLapply(cl=NULL, X, fun, ...)
parSapply(cl=NULL, X, FUN, ..., simplify=TRUE, USE.NAMES=TRUE)
parApply(cl=NULL, X, MARGIN, FUN, ...)
parRapply(cl=NULL, x, FUN, ...)
parCapply(cl=NULL, x, FUN, ...)
parLapplyLB(cl=NULL, X, fun, ...)
parSapplyLB(cl=NULL, X, FUN, ..., simplify=TRUE, USE.NAMES=TRUE)
```

Arguments

- `cl` A cluster-like object.
- `x` A vector-like object for `clusterApply` and `clusterApplyLB`. A matrix-like object for `parRapply` and `parCapply`.
- `seq` Vector-like object to split.
- `X` A vector-like object for `parLapply`, `parSapply`, `parLapplyLB`, and `parSapplyLB`. An array-like object for `parApply`.
- `fun`, ..., `expr`, `varlist`, `envir`, `MoreArgs`, `RECYCLE`, `SIMPLIFY`, `USE.NAMES`, `.scheduling`, `FUN`, `simplify`

See ?parallel::clusterApply for a description of these arguments.

Value

See ?parallel::clusterApply for the value returned by the default methods.

Specific methods defined in Bioconductor packages should behave like the default methods.
See Also

- `parallel::clusterApply` for the default methods.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
clusterCall # note the dispatch on the 'cl' arg only
showMethods("clusterCall")
selectMethod("clusterCall", "ANY") # the default method

clusterApply # note the dispatch on the 'cl' and 'x' args only
showMethods("clusterApply")
selectMethod("clusterApply", c("ANY", "ANY")) # the default method

clusterApplyLB # note the dispatch on the 'cl' and 'x' args only
showMethods("clusterApplyLB")
selectMethod("clusterApplyLB", c("ANY", "ANY")) # the default method

clusterEvalQ # note the dispatch on the 'cl' arg only
showMethods("clusterEvalQ")
selectMethod("clusterEvalQ", "ANY") # the default method

clusterExport # note the dispatch on the 'cl' arg only
showMethods("clusterExport")
selectMethod("clusterExport", "ANY") # the default method

clusterMap # note the dispatch on the 'cl' arg only
showMethods("clusterMap")
selectMethod("clusterMap", "ANY") # the default method

clusterSplit
showMethods("clusterSplit")
selectMethod("clusterSplit", c("ANY", "ANY")) # the default method

parLapply # note the dispatch on the 'cl' and 'X' args only
showMethods("parLapply")
selectMethod("parLapply", c("ANY", "ANY")) # the default method

parSapply # note the dispatch on the 'cl' and 'X' args only
showMethods("parSapply")
selectMethod("parSapply", c("ANY", "ANY")) # the default method

parApply # note the dispatch on the 'cl' and 'X' args only
showMethods("parApply")
selectMethod("parApply", c("ANY", "ANY")) # the default method

parRapply # note the dispatch on the 'cl' and 'x' args only
showMethods("parRapply")
selectMethod("parRapply", c("ANY", "ANY")) # the default method

parCapply # note the dispatch on the 'cl' and 'x' args only
showMethods("parCapply")
selectMethod("parCapply", c("ANY", "ANY")) # the default method
```
**combine**

Combining or merging different Bioconductor data structures

Description

The `combine` generic function handles methods for combining or merging different Bioconductor data structures. It should, given an arbitrary number of arguments of the same class (possibly by inheritance), combine them into a single instance in a sensible way (some methods may only combine 2 objects, ignoring ... in the argument list; because Bioconductor data structures are complicated, check carefully that combine does as you intend).

Usage

`combine(x, y, ...)`

Arguments

- `x` One of the values.
- `y` A second value.
- `...` Any other objects of the same class as `x` and `y`.

Details

There are two basic combine strategies. One is an intersection strategy. The returned value should only have rows (or columns) that are found in all input data objects. The union strategy says that the return value will have all rows (or columns) found in any one of the input data objects (in which case some indication of what to use for missing values will need to be provided).

These functions and methods are currently under construction. Please let us know if there are features that you require.

Value

A single value of the same class as the most specific common ancestor (in class terms) of the input values. This will contain the appropriate combination of the data in the input values.

Methods

The following methods are defined in the `BiocGenerics` package:

- `combine(x=ANY, missing)` Return the first (x) argument unchanged.
combine(data.frame, data.frame) Combines two data.frame objects so that the resulting data.frame contains all rows and columns of the original objects. Rows and columns in the returned value are unique, that is, a row or column represented in both arguments is represented only once in the result. To perform this operation, combine makes sure that data in shared rows and columns are identical in the two data.frames. Data differences in shared rows and columns usually cause an error. combine issues a warning when a column is a factor and the levels of the factor in the two data.frames are different.

combine(matrix, matrix) Combined two matrix objects so that the resulting matrix contains all rows and columns of the original objects. Both matrices must have dimnames. Rows and columns in the returned value are unique, that is, a row or column represented in both arguments is represented only once in the result. To perform this operation, combine makes sure that data in shared rows and columns are all equal in the two matrices.

Additional combine methods are defined in the Biobase package for AnnotatedDataFrame, AssayData, MIAME, and eSet objects.

Author(s)
Biocore

See Also
- merge for merging two data frames (or data.frame-like) objects.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

```r
combine
showMethods("combine")
selectMethod("combine", c("ANY", "missing"))
selectMethod("combine", c("data.frame", "data.frame"))
selectMethod("combine", c("matrix", "matrix"))

## ---------------------------------------------------------------------
## COMBINING TWO DATA FRAMES
## ---------------------------------------------------------------------
x <- data.frame(x=1:5,
                y=factor(letters[1:5], levels=letters[1:8]),
                row.names=letters[1:5])
y <- data.frame(z=3:7,
                y=factor(letters[3:7], levels=letters[1:8]),
                row.names=letters[3:7])
combine(x, y)

w <- data.frame(w=4:8,
                y=factor(letters[4:8], levels=letters[1:8]),
                row.names=letters[4:8])
combine(w, x, y)
```
# y is converted to 'factor' with different levels
df1 <- data.frame(x=1:5, y=letters[1:5], row.names=letters[1:5])
df2 <- data.frame(z=3:7, y=letters[3:7], row.names=letters[3:7])
try(combine(df1, df2)) # fails

# solution 1: ensure identical levels
y1 <- factor(letters[1:5], levels=letters[1:7])
y2 <- factor(letters[3:7], levels=letters[1:7])
df1 <- data.frame(x=1:5, y=y1, row.names=letters[1:5])
df2 <- data.frame(z=3:7, y=y2, row.names=letters[3:7])
combine(df1, df2)

# solution 2: force column to be 'character'
df1 <- data.frame(x=1:5, y=I(letters[1:5]), row.names=letters[1:5])
df2 <- data.frame(z=3:7, y=I(letters[3:7]), row.names=letters[3:7])
combine(df1, df2)

## ---------------------------------------------------------------------
## COMBINING TWO MATRICES
## ---------------------------------------------------------------------
m <- matrix(1:20, nrow=5, dimnames=list(LETTERS[1:5], letters[1:4]))
combine(m[1:3,], m[4:5,])
combine(m[1:3, 1:3], m[3:5, 3:4]) # overlap

## dbconn

Accessing SQLite DB information

Description

Get a connection object or file path for a SQLite DB

Usage

dbconn(x)
dbfile(x)

Arguments

x An object with a SQLite connection.

Value

dbconn returns a connection object to the SQLite DB containing x’s data.
dbfile returns a path (character string) to the SQLite DB (file) containing x’s data.

See Also

- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `dbconn,AnnotationDb-method` in the `AnnotationDbi` package for an example of a specific dbconn method (defined for `dbconn` objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.
Examples

dbconn
  showMethods("dbconn")
dbfile
  showMethods("dbfile")

library(AnnotationDbi)
  showMethods("dbconn")
  selectMethod("dbconn", "AnnotationDb")

density
  Kernel density estimation

Description

The generic function density computes kernel density estimates.

NOTE: This man page is for the density S4 generic function defined in the BiocGenerics package. See ?stats::density for the default method (defined in the stats package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

density(x, ...)

Arguments

x, ... See ?stats::density.

Value

See ?stats::density for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

- stats::density for the default density method.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- density.flowClust-method in the flowClust package for an example of a specific density method (defined for flowClust objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

density
  showMethods("density")
  selectMethod("density", "ANY") # the default method
Accessors and generic functions used in the context of count datasets

Description

These generic functions provide basic interfaces to operations on and data access to count datasets.

Usage

```
counts(object, ...)  # and other functions
```

```
counts(object, ...) <- value
dispTable(object, ...) <- value
sizeFactors(object, ...) <- value
conditions(object, ...) <- value
design(object, ...) <- value
estimateSizeFactors(object, ...)
estimateDispersions(object, ...)
plotDispEsts(object, ...)
```

Arguments

- **object**: Object of class for which methods are defined, e.g., `CountDataSet`, `DESeqSummarizedExperiment` or `ExonCountSet`.
- **value**: Value to be assigned to corresponding components of `object`; supported types depend on method implementation.
- **...**: Further arguments, perhaps used by methods

Details

For the details, please consult the manual pages of the methods in the `DESeq`, `DESeq2`, and `DEXSeq` packages and the package vignettes.

**do.call**

**Execute a function call**

Description

`do.call` constructs and executes a function call from a name or a function and a list of arguments to be passed to it.

NOTE: This man page is for the `do.call` S4 generic function defined in the `BiocGenerics` package. See `?base::do.call` for the default method (defined in the `base` package). Bioconductor packages can define specific methods for objects not supported by the default method.
Usage

```r
do.call(what, args, quote=FALSE, envir=parent.frame())
```

Arguments

- **what**: The default method expects either a function or a non-empty character string naming the function to be called. See `?base::do.call` for the details. Specific methods can support other objects. Please refer to the documentation of a particular method for the details.

- **args**: The default method expects a list of arguments to the function call (the names attribute of `args` gives the argument names). See `?base::do.call` for the details. Specific methods can support other objects. Please refer to the documentation of a particular method for the details.

- **quote, envir**: See `?base::do.call` for a description of these arguments.

Value

The result of the (evaluated) function call. Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

- `base::do.call` for the default `do.call` method.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
do.call # note the dispatch on the 'what' and 'args' args only
showMethods("do.call")
selectMethod("do.call", c("ANY", "ANY")) # the default method
```

duplicated

```r
Determine duplicate elements
```

Description

Determines which elements of a vector-like or data-frame-like object are duplicates of elements with smaller subscripts, and returns a logical vector indicating which elements (rows) are duplicates.

NOTE: This man page is for the duplicated and anyDuplicated S4 generic functions defined in the `BiocGenerics` package. See `?base::duplicated` for the default methods (defined in the `base` package). Bioconductor packages can define specific methods for objects (typically vector-like or data-frame-like) not supported by the default method.
Usage

duplicated(x, incomparables=FALSE, ...)  
anyDuplicated(x, incomparables=FALSE, ...)

Arguments

x A vector-like or data-frame-like object.

incomparables, ...  
See ?base::duplicated for a description of these arguments.

Value

The default duplicated method (see ?base::duplicated) returns a logical vector of length N where N is:

• length(x) when x is a vector;
• nrow(x) when x is a data frame.

Specific duplicated methods defined in Bioconductor packages must also return a logical vector of the same length as x when x is a vector-like object, and a logical vector with one element for each row when x is a data-frame-like object.

The default anyDuplicated method (see ?base::duplicated) returns a single non-negative integer and so must the specific anyDuplicated methods defined in Bioconductor packages.

anyDuplicated should always behave consistently with duplicated.

See Also

• base::duplicated for the default duplicated and anyDuplicated methods.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• duplicated.Rle-method in the S4Vectors package for an example of a specific duplicated method (defined for Rle objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

duplicated
showMethods("duplicated")
selectMethod("duplicated", "ANY")  # the default method

anyDuplicated
showMethods("anyDuplicated")
selectMethod("anyDuplicated", "ANY")  # the default method
eval

Evaluate an (unevaluated) expression

Description

eval evaluates an R expression in a specified environment.

NOTE: This man page is for the eval S4 generic function defined in the BiocGenerics package. See ?base::eval for the default method (defined in the base package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

eval(expr, envir=parent.frame(),
     enclos=if (is.list(envir) || is.pairlist(envir))
               parent.frame()
             else baseenv())

Arguments

expr An object to be evaluated. May be any object supported by the default method (see ?base::eval) or by the additional methods defined in Bioconductor packages.

envir The environment in which expr is to be evaluated. May be any object supported by the default method (see ?base::eval) or by the additional methods defined in Bioconductor packages.

enclos See ?base::eval for a description of this argument.

Value

See ?base::eval for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

• base::eval for the default eval method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• eval,expression,Vector-method in the IRanges package for an example of a specific eval method (defined for when the expr and envir arguments are an expression and a Vector object, respectively).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

eval # note the dispatch on 'expr' and 'envir' args only
showMethods("eval")
selectMethod("eval", c("ANY", "ANY")) # the default method
**evalq**

Evaluate an (unevaluated) expression

### Description

evalq evaluates an R expression (the quoted form of its first argument) in a specified environment.

NOTE: This man page is for the evalq wrapper defined in the BiocGenerics package. See ?base::evalq for the function defined in the base package. This wrapper correctly delegates to the eval generic, rather than base::eval.

### Usage

evalq(expr, envir=parent.frame(),
   enclos=if (is.list(envir) || is.pairlist(envir))
            parent.frame() else baseenv())

### Arguments

- **expr**: Quoted to form the expression that is evaluated.
- **envir**: The environment in which expr is to be evaluated. May be any object supported by methods on the eval generic.
- **enclos**: See ?base::evalq for a description of this argument.

### Value

See ?base::evalq.

### See Also

- base::evalq for the base evalq function.

### Examples

evalq  # note just a copy of the original evalq

---

**Extremes**

Maxima and minima

### Description

pmax, pmin, pmax.int and pmin.int return the parallel maxima and minima of the input values.

NOTE: This man page is for the pmax, pmin, pmax.int and pmin.int S4 generic functions defined in the BiocGenerics package. See ?base::pmax for the default methods (defined in the base package). Bioconductor packages can define specific methods for objects (typically vector-like or matrix-like) not supported by the default methods.
Usage

\begin{verbatim}
  pmax(..., na.rm=FALSE)
  pmin(..., na.rm=FALSE)
  pmax.int(..., na.rm=FALSE)
  pmin.int(..., na.rm=FALSE)
\end{verbatim}

Arguments

\begin{verbatim}
  ... One or more vector-like or matrix-like objects.
  na.rm See ?base::pmax for a description of this argument.
\end{verbatim}

Value

See ?base::pmax for the value returned by the default methods.

Specific methods defined in Bioconductor packages will typically return an object of the same class as the input objects.

See Also

- base::pmax for the default pmax, pmin, pmax.int and pmin.int methods.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- pmax.Rle-method in the S4Vectors package for an example of a specific pmax method (defined for Rle objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

\begin{verbatim}
pmax
  showMethods("pmax")
  selectMethod("pmax", "ANY")  # the default method

pmin
  showMethods("pmin")
  selectMethod("pmin", "ANY")  # the default method

pmax.int
  showMethods("pmax.int")
  selectMethod("pmax.int", "ANY")  # the default method

pmin.int
  showMethods("pmin.int")
  selectMethod("pmin.int", "ANY")  # the default method
\end{verbatim}
fileName

Accessing the file name of an object

Description

Get the file name of an object.

Usage

fileName(object, ...)

Arguments

object An object with a file name.
...

Additional arguments, for use in specific methods.

See Also

• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• fileName.MSmap-method in the MSnbase package for an example of a specific fileName method (defined for MSmap objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

fileName
showMethods("fileName")

library(MSnbase)
showMethods("fileName")
selectMethod("fileName", "MSmap")

funprog

Common higher-order functions in functional programming languages

Description

Reduce uses a binary function to successively combine the elements of a given list-like or vector-like object and a possibly given initial value. Filter extracts the elements of a list-like or vector-like object for which a predicate (logical) function gives true. Find and Position give the first or last such element and its position in the object, respectively. Map applies a function to the corresponding elements of given list-like or vector-like objects.

NOTE: This man page is for the Reduce, Filter, Find, Map and Position S4 generic functions defined in the BiocGenerics package. See ?base::Reduce for the default methods (defined in the base package). Bioconductor packages can define specific methods for objects (typically list-like or vector-like) not supported by the default methods.
### Usage

```r
Reduce(f, x, init, right=FALSE, accumulate=FALSE)
Filter(f, x)
Find(f, x, right=FALSE, nomatch=NULL)
Map(f, ...)
Position(f, x, right=FALSE, nomatch=NA_integer_)
```

### Arguments

- `f`, `init`, `right`, `accumulate`, `nomatch`
  - See `?base::Reduce` for a description of these arguments.
- `x`
  - A list-like or vector-like object.
- `...`
  - One or more list-like or vector-like objects.

### Value

See `?base::Reduce` for the value returned by the default methods.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default methods.

### See Also

- `base::Reduce` for the default `Reduce`, `Filter`, `Find`, `Map` and `Position` methods.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `Reduce.List-method` in the `S4Vectors` package for an example of a specific `Reduce` method (defined for `List` objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

### Examples

```r
Reduce  # note the dispatch on the 'x' arg only
showMethods("Reduce")
selectMethod("Reduce", "ANY")  # the default method

Filter  # note the dispatch on the 'x' arg only
showMethods("Filter")
selectMethod("Filter", "ANY")  # the default method

Find  # note the dispatch on the 'x' arg only
showMethods("Find")
selectMethod("Find", "ANY")  # the default method

Map  # note the dispatch on the '...' arg only
showMethods("Map")
selectMethod("Map", "ANY")  # the default method

Position  # note the dispatch on the 'x' arg only
showMethods("Position")
selectMethod("Position", "ANY")  # the default method
```
Description

Search for an object with a given name and return it.

NOTE: This man page is for the get and mget S4 generic functions defined in the BiocGenerics package. See ?base::get for the default methods (defined in the base package). Bioconductor packages can define specific methods for objects (list-like or environment-like) not supported by the default methods.

Usage

get(x, pos=-1, envir=as.environment(pos), mode="any", inherits=TRUE)
mget(x, envir, mode="any", ifnotfound, inherits=FALSE)

Arguments

x For get: A variable name (or, more generally speaking, a key), given as a single string.
For mget: A vector of variable names (or keys).

envir Where to look for the key(s). Typically a list-like or environment-like object.

pos, mode, inherits, ifnotfound
See ?base::get for a description of these arguments.

Details

See ?base::get for details about the default methods.

Value

For get: The value corresponding to the specified key.
For mget: The list of values corresponding to the specified keys. The returned list must have one element per key, and in the same order as in x.

See ?base::get for the value returned by the default methods.

See Also

• base::get for the default get and mget methods.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• get,ANY,Bimap,missing-method in the AnnotationDbi package for an example of a specific get method (defined for Bimap objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.
Examples

grep # note the dispatch on the 'x', 'pos' and 'envir' args only
showMethods("grep")
selectMethod("grep", c("ANY", "ANY", "ANY"))  # the default method

mget # note the dispatch on the 'x' and 'envir' args only
showMethods("mget")
selectMethod("mget", c("ANY", "ANY"))  # the default method

Description

Search for matches to argument 'pattern' within each element of a character vector.

NOTE: This man page is for the grep and grepl S4 generic functions defined in the BiocGenerics package. See \?base::grep for the default methods (defined in the base package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

grep(pattern, x, ignore.case = FALSE, perl = FALSE, value = FALSE,
     fixed = FALSE, useBytes = FALSE, invert = FALSE)
grepl(pattern, x, ignore.case = FALSE, perl = FALSE,
     fixed = FALSE, useBytes = FALSE)

Arguments

pattern The pattern for searching in x, such as a regular expression.
x The character vector (in the general sense) to search.
ignore.case, perl, value, fixed, useBytes, invert
     See \?base::grep for a description of these arguments.

Value

See \?base::grep for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

* base::grep for the default grep and grepl methods.
* showMethods for displaying a summary of the methods defined for a given generic function.
* selectMethod for getting the definition of a specific method.
* BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

grep # note the dispatch on 'pattern' and 'x' args only
showMethods("grep")
selectMethod("grep", "ANY")  # the default method
Display a color image

Description

Creates a grid of colored or gray-scale rectangles with colors corresponding to the values in \( z \). This can be used to display three-dimensional or spatial data aka *images*.

NOTE: This man page is for the \texttt{image} S4 generic function defined in the \texttt{BiocGenerics} package. See \texttt{?graphics::image} for the default method (defined in the \texttt{graphics} package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

\texttt{image(x, ...)}

Arguments

\( x, ... \) See \texttt{?graphics::image}.

Details

See \texttt{?graphics::image} for the details.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

- \texttt{graphics::image} for the default image method.
- \texttt{showMethods} for displaying a summary of the methods defined for a given generic function.
- \texttt{selectMethod} for getting the definition of a specific method.
- \texttt{image,FeatureSet-method} in the \texttt{oligo} package for an example of a specific image method (defined for \texttt{FeatureSet} objects).
- \texttt{BiocGenerics} for a summary of all the generics defined in the \texttt{BiocGenerics} package.

Examples

\begin{verbatim}
image
showMethods("image")
selectMethod("image", "ANY")  # the default method
\end{verbatim}
IQR  

The Interquartile Range

Description

Compute the interquartile range for a vector.

NOTE: This man page is for the IQR S4 generic function defined in the BiocGenerics package. See ?stats::IQR for the default method (defined in the stats package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

IQR(x, na.rm = FALSE, type = 7)

Arguments

x, na.rm, type  See ?stats::IQR.

Value

See ?stats::IQR for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

• stats::IQR for the default IQR method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

IQR
showMethods("IQR")
selectMethod("IQR", "ANY")  # the default method

is.unsorted  

Test if a vector-like object is not sorted

Description

Test if a vector-like object is not sorted, without the cost of sorting it.

NOTE: This man page is for the is.unsorted S4 generic function defined in the BiocGenerics package. See ?base::is.unsorted for the default method (defined in the base package). Bioconductor packages can define specific methods for objects (typically vector-like) not supported by the default method.
is.unsorted

Usage

is.unsorted(x, na.rm=FALSE, strictly=FALSE, ...)

Arguments

x A vector-like object.

na.rm, strictly

See ?base::is.unsorted for a description of these arguments.

... Additional arguments, for use in specific methods.

Note that base::is.unsorted (the default method) only takes the x, na.rm,
and strictly arguments.

Value

See ?base::is.unsorted for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with
the default method.

Note

TO DEVELOPERS:

The is.unsorted method for specific vector-like objects should adhere to the same underlying
order used by the order, sort, and rank methods for the same objects.

See Also

- base::is.unsorted for the default is.unsorted method.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- is.unsorted,GenomicRanges-method in the GenomicRanges package for an example of a spe-
cific is.unsorted method (defined for GenomicRanges objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

is.unsorted # note the dispatch on the 'x' arg only
showMethods("is.unsorted")
selectMethod("is.unsorted", "ANY") # the default method
lapply

Apply a function over a list-like or vector-like object

Description

lapply returns a list of the same length as X, each element of which is the result of applying FUN to the corresponding element of X.
sapply is a user-friendly version and wrapper of lapply by default returning a vector, matrix or, if simplify="array", an array if appropriate, by applying simplify2array(). sapply(x, f, simplify=FALSE, USE.NAMES=FALSE) is the same as lapply(x, f).

NOTE: This man page is for the lapply and sapply S4 generic functions defined in the Bioconductor package. See ?base::lapply for the default methods (defined in the base package). Bioconductor packages can define specific methods for objects (typically list-like or vector-like) not supported by the default methods.

Usage

lapply(X, FUN, ...)  
sapply(X, FUN, ..., simplify=TRUE, USE.NAMES=TRUE)

Arguments

X
A list-like or vector-like object.
FUN, ..., simplify, USE.NAMES
See ?base::lapply for a description of these arguments.

Value

See ?base::lapply for the value returned by the default methods.
Specific methods defined in Bioconductor packages should behave as consistently as possible with the default methods. In particular, lapply and sapply(simplify=FALSE) should always return a list.

See Also

• base::lapply for the default lapply and sapply methods.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• lapply.List-method in the S4Vectors package for an example of a specific lapply method (defined for List objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

lapply # note the dispatch on the 'X' arg only
showMethods("lapply")
selectMethod("lapply", "ANY") # the default method

sapply # note the dispatch on the 'X' arg only
showMethods("sapply")
selectMethod("sapply", "ANY") # the default method
Description

Get the length of each list element of a list-like object.

NOTE: This man page is for the lengths S4 generic function defined in the BiocGenerics package. See ?base::lengths for the default method (defined in the base package). Bioconductor packages can define specific methods for list-like objects not supported by the default method.

Usage

lengths(x, use.names=TRUE)

Arguments

x A list-like object. Can also be a vector-like object that is not list-like, in which case the result is trivial.

use.names See ?base::lengths for a description of this argument.

Value

See ?base::lengths for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

Note

IMPORTANT: The default method (base::lengths) is equivalent to sapply(x, length). However, because the lengths method for Vector objects is currently defined as an alias for S4Vectors::elementNROWS, it’s equivalent to sapply(x, NROW), not to sapply(x, length).

This makes a difference if x has array-like list elements. See ?base::NROW for the difference between length() and NROW(). This difference is illustrated in the Examples section below.

This is a temporary situation that will be addressed in BioC 3.3.

See Also

• base::lengths for the default lengths method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• lengths,Vector-method in the S4Vectors package for an example of a specific lengths method (defined for Vector objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.
Examples

```r
lengths  # note the dispatch on the 'x' arg only
showMethods("lengths")
selectMethod("lengths", "ANY")  # the default method

library(S4Vectors)
showMethods("lengths")
selectMethod("lengths", "Vector")  # the "lengths" method for Vector objects

## Difference between default method and method for Vector objects:
groups <- c("group1", "group2")
df <- data.frame(
  a=letters[1:10],
  i=101:110,
  group=rep(factor(groups, levels=groups), c(6, 4))
)
x1 <- split(df, df$group)
x2 <- split(DataFrame(df), df$group)
lengths(x1)  # dispatch on default method
lengths(x2)  # dispatch on method for Vector objects
```

---

### mad

**Median Absolute Deviation**

**Description**
Compute the median absolute deviation for a vector, dispatching only on the first argument, `x`.

NOTE: This man page is for the `mad` S4 generic function defined in the `BiocGenerics` package. See `?stats::mad` for the default method (defined in the `stats` package). Bioconductor packages can define specific methods for objects not supported by the default method.

**Usage**

```r
mad(x, center = median(x), constant = 1.4826,
    na.rm = FALSE, low = FALSE, high = FALSE)
```

**Arguments**

- `x`, `center`, `constant`, `na.rm`, `low`, `high`
  See `?stats::mad`.

**Value**
See `?stats::mad` for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.
mapply

See Also

- `stats::mad` for the default mad method.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
mad
showMethods("mad")
selectMethod("mad", "ANY")  # the default method
```

Description

`mapply` is a multivariate version of `sapply`. `mapply` applies `FUN` to the first elements of each ... argument, the second elements, the third elements, and so on. Arguments are recycled if necessary.

NOTE: This man page is for the `mapply S4 generic function` defined in the `BiocGenerics` package. See `?base::mapply` for the default method (defined in the `base` package). Bioconductor packages can define specific methods for objects (typically list-like or vector-like) not supported by the default methods.

Usage

```r
mapply(FUN, ..., MoreArgs=NULL, SIMPLIFY=TRUE, USE.NAMES=TRUE)
```

Arguments

- `FUN`, `MoreArgs`, `SIMPLIFY`, `USE.NAMES`
  
  See `?base::mapply` for a description of these arguments.
  
- `...`

  One or more list-like or vector-like objects of strictly positive length, or all of zero length.

Value

See `?base::mapply` for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

- `base::mapply` for the default mapply method.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.
Examples

mapply  # note the dispatch on the '...' arg only
showMethods("mapply")
selectMethod("mapply", "ANY")  # the default method

match

Value matching

Description

match returns a vector of the positions of (first) matches of its first argument in its second.

NOTE: This man page is for the match S4 generic function defined in the BiocGenerics package. See ?base::match for the default method (defined in the base package). Bioconductor packages can define specific methods for objects (typically vector-like) not supported by the default method.

Usage

match(x, table, nomatch=NA_integer_, incomparables=NULL, ...)

Arguments

x, table  Vector-like objects (typically of the same class, but not necessarily).
nomatch, incomparables
See ?base::match for a description of these arguments.
...  Additional arguments, for use in specific methods.

Value

The same as the default method, that is, an integer vector of the same length as x giving the position in table of the first match if there is a match, otherwise nomatch.

See ?base::match for more details.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

Note

The default method (defined in the base package) doesn’t have the ... argument. We’ve added it to the generic function defined in the BiocGenerics package in order to allow specific methods to support additional arguments if needed.

See Also

- base::match for the default match method.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- match.Hits.Hits-method in the S4Vectors package for an example of a specific match method (defined for Hits objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.
Examples

```r
match # note the dispatch on the 'x' and 'table' args only
showMethods("match")
selectMethod("match", c("ANY", "ANY")) # the default method
```

Description

Form row and column sums and means for rectangular objects.

NOTE: This man page is for the `rowSums`, `colSums`, `rowMeans`, and `colMeans` S4 generic functions defined in the `BiocGenerics` package. See `?base::colSums` for the default methods (defined in the `base` package). Bioconductor packages can define specific methods for objects (typically array-like) not supported by the default method.

Usage

```r
colSums (x, na.rm = FALSE, dims = 1)
rowSums (x, na.rm = FALSE, dims = 1)
colMeans(x, na.rm = FALSE, dims = 1)
rowMeans(x, na.rm = FALSE, dims = 1)
```

Arguments

- `x`: a rectangular object, like a matrix or data frame
- `na.rm`, `dims`: see `colSums`

Value

See `?base::colSums` for the value returned by the default methods.

Specific methods defined in Bioconductor packages will typically return an object of the same class as the input object.

See Also

- `base::colSums` for the default `colSums`, `rowSums`, `colMeans`, and `colSums` methods.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
colSums
showMethods("colSums")
selectMethod("colSums", "ANY") # the default method
```
mean  

Arithmetic Mean

Description

Generic function for the (trimmed) arithmetic mean.

NOTE: This man page is for the mean S4 generic function defined in the BiocGenerics package. See ?base::mean for the default method (defined in the base package). Bioconductor packages can define specific methods for objects (typically vector-like) not supported by the default method.

Usage

mean(x, ...)

Arguments

x typically a vector-like object

... see mean

Value

See ?base::mean for the value returned by the default method.

Specific methods defined in Bioconductor packages will typically return an object of the same class as the input object.

See Also

• base::mean for the default mean method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• mean,Rle-method in the S4Vectors package for an example of a specific mean method (defined for Rle objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

mean
showMethods("mean")
selectMethod("mean", "ANY")  # the default method
normalize

Normalize an object

Description

A generic function which normalizes an object containing microarray data or other data. Normalization is intended to remove from the intensity measures any systematic trends which arise from the microarray technology rather than from differences between the probes or between the target RNA samples hybridized to the arrays.

Usage

normalize(object, ...)

Arguments

object          A data object, typically containing microarray data.
...             Additional arguments, for use in specific methods.

Value

An object containing the normalized data.

See Also

• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• normalize.AffyBatch-method in the affy package and normalize.FeatureSet-method in the oligo package for examples of specific normalize methods (defined for AffyBatch and FeatureSet objects, respectively).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

normalize
showMethods("normalize")

library(affy)
showMethods("normalize")
selectMethod("normalize", "AffyBatch")
The number of rows/columns of an array-like object

Description

Return the number of rows or columns present in an array-like object.

NOTE: This man page is for the nrow, ncol, NROW and NCOL S4 generic functions defined in the BiocGenerics package. See `?base::nrow` for the default methods (defined in the base package). Bioconductor packages can define specific methods for objects (typically matrix- or array-like) not supported by the default methods.

Usage

nrow(x)
ncol(x)
NROW(x)
NCOL(x)

Arguments

x A matrix- or array-like object.

Value

A single integer or NULL.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default methods.

See Also

- `base::nrow` for the default nrow, ncol, NROW and NCOL methods.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `nrow,DataFrame-method` in the S4Vectors package for an example of a specific nrow method (defined for DataFrame objects).
- `BioGenerics` for a summary of all the generics defined in the BioGenerics package.

Examples

nrow
showMethods("nrow")
selectMethod("nrow", "ANY") # the default method

ncol
showMethods("ncol")
selectMethod("ncol", "ANY") # the default method

NROW
showMethods("NROW")
selectMethod("NROW", "ANY") # the default method
Description

order returns a permutation which rearranges its first argument into ascending or descending order, breaking ties by further arguments.

NOTE: This man page is for the order S4 generic function defined in the BiocGenerics package. See \texttt{?base::order} for the default method (defined in the base package). Bioconductor packages can define specific methods for objects (typically vector-like) not supported by the default method.

Usage

\begin{verbatim}
order(...) na.last=TRUE, decreasing=FALSE, method=c("auto", "shell", "radix")
\end{verbatim}

Arguments

... One or more vector-like objects, all of the same length.
na.last, decreasing, method

See \texttt{?base::order} for a description of these arguments.

Value

The default method (see \texttt{?base::order}) returns an integer vector of length N where N is the common length of the input objects. This integer vector represents a permutation of N elements and can be used to rearrange the first argument in ... into ascending or descending order (by subsetting it).

Specific methods defined in Bioconductor packages should also return an integer vector representing a permutation of N elements.

Note

TO DEVELOPERS:

Specific order methods should preferably be made "stable" for consistent behavior across platforms and consistency with base::order(). Note that C \texttt{qsort()} is not "stable" so order methods that use qsort() at the C-level need to ultimately break ties by position, which can easily be done by adding a little extra code at the end of the comparison function passed to qsort().

order(x, decreasing=TRUE) is not always equivalent to \texttt{rev(order(x))}.

order, sort, and rank methods for specific vector-like objects should adhere to the same underlying order that should be conceptually defined as a binary relation on the set of all possible vector values. For completeness, this binary relation should also be incarnated by a \texttt{<=} method.
See Also

- `base::order` for the default `order` method.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `order.Ranges-method` in the `IRanges` package for an example of a specific `order` method (defined for `Ranges` objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
order
showMethods("order")
selectMethod("order", "ANY") # the default method
```

---

**organism_species**

**Organism and species accessors**

Description

Get or set the organism and/or species of an object.

Usage

```r
organism(object)
organism(object) <- value

species(object)
species(object) <- value
```

Arguments

```r
object  An object to get or set the organism or species of.
value   The organism or species to set on `object`.
```

Value

The `organism` accessor should return the *scientific name* (i.e. genus and species, or genus and species and subspecies) of the organism. Preferably in the format "Genus species" (e.g. "Homo sapiens") or "Genus species subspecies" (e.g. "Homo sapiens neanderthalensis").

The `species` accessor should return the species of the organism. Unfortunately there is a long history of misuse of this accessor in Bioconductor so its usage is now discouraged (starting with BioC 3.1).

Note

TO DEVELOPERS:

Species has been historically misused in many places in Bioconductor and is redundant with `organism`. So implementing the `species` accessor is now discouraged (starting with BioC 3.1). The `organism` accessor (returning the *scientific name*) should be implemented instead.
See Also

- [http://bioconductor.org/packages/release/BiocViews.html#___Organism](http://bioconductor.org/packages/release/BiocViews.html#___Organism) for browsing the annotation packages currently available in Bioconductor by organism.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `organism,character-method` and `organism,chromLocation-method` in the `annotate` package for examples of specific organism methods (defined for character and chromLocation objects).
- `species,AnnotationDb-method` in the `AnnotationDbi` package for an example of a specific species method (defined for AnnotationDb objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
## organism getter:
organism
showMethods("organism")

library(annotate)
showMethods("organism")
selectMethod("organism", "character")
selectMethod("organism", "chromLocation")

## organism setter:
`\organism<-`
showMethods("organism<-")

## species getter:
species
showMethods("species")

library(AnnotationDbi)
selectMethod("species", "AnnotationDb")

## species setter:
`\species<-`
showMethods("species<-")
```

Description

`paste` concatenates vectors of strings or vector-like objects containing strings.

NOTE: This man page is for the `paste` *S4 generic function* defined in the `BiocGenerics` package. See `?base::paste` for the default method (defined in the `base` package). Bioconductor packages can define specific methods for objects (typically vector-like objects containing strings) not supported by the default method.

Usage

```r
paste(..., sep=" ", collapse=NULL)
```
plotMA

Arguments

... One or more vector-like objects containing strings.
sep, collapse See ?base::paste for a description of these arguments.

Value

See ?base::paste for the value returned by the default method.
Specific methods defined in Bioconductor packages will typically return an object of the same class as the input objects.

See Also

- base::paste for the default paste method.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- paste.Rle-method in the S4Vectors package for an example of a specific paste method (defined for Rle objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

```r
paste
showMethods("paste")
selectMethod("paste", "ANY")  # the default method
```

plotMA MA-plot: plot differences versus averages for high-throughput data

Description

A generic function which produces an MA-plot for an object containing microarray, RNA-Seq or other data.

Usage

```r
plotMA(object, ...)
```

Arguments

- **object** A data object, typically containing count values from an RNA-Seq experiment or microarray intensity values.
- ... Additional arguments, for use in specific methods.

Value

Undefined. The function exists for its side effect, producing a plot.
plotPCA

See Also
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `plotMA` in the `limma` package for a function with the same name that is not dispatched through this generic function.
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
showMethods("plotMA")

suppressWarnings(
  if(require("DESeq2"))
    example("plotMA", package="DESeq2", local=TRUE)
)
```

plotPCA  PCA-plot: Principal Component Analysis plot

Description
A generic function which produces a PCA-plot.

Usage
plotPCA(object, ...)

Arguments
- `object` A data object, typically containing gene expression information.
- `...` Additional arguments, for use in specific methods.

Value
Undefined. The function exists for its side effect, producing a plot.

See Also
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `plotPCA` in the `DESeq2` package for an example method that uses this generic.
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
showMethods("plotPCA")

suppressWarnings(
  if(require("DESeq2"))
    example("plotPCA", package="DESeq2", local=TRUE)
)
```
rank

Ranks the values in a vector-like object

Description

Returns the ranks of the values in a vector-like object. Ties (i.e., equal values) and missing values can be handled in several ways.

NOTE: This man page is for the rank S4 generic function defined in the BiocGenerics package. See ?base::rank for the default method (defined in the base package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

rank(x, na.last=TRUE,
     ties.method=c("average", "first", "last", "random", "max", "min"),
     ...) 

Arguments

x A vector-like object.

na.last, ties.method
See ?base::rank for a description of these arguments.

... Additional arguments, for use in specific methods.

Note that base::rank (the default method) only takes the x, na.last, and ties.method arguments.

Value

See ?base::rank for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

• base::rank for the default rank method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• rank,Vector-method in the S4Vectors package for an example of a specific rank method (defined for Vector objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.
Examples

rank # note the dispatch on the 'x' arg only
showMethods("rank")
selectMethod("rank", "ANY") # the default method

Description

relist is a generic function with a few methods in order to allow easy inversion of unlist(x).

NOTE: This man page is for the relist S4 generic function defined in the BiocGenerics package. See ?utils::relist for the default method (defined in the utils package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

relist(flesh, skeleton)

Arguments

flesh A vector-like object.
skeleton A list-like object. Only the "shape" (i.e. the lengths of the individual list elements) of skeleton matters. Its exact content is ignored.

Value

A list-like object with the same "shape" as skeleton and that would give flesh back if unlist()ed.

See Also

• utils::relist for the default relist method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• relist,ANY,List-method in the IRanges package for an example of a specific relist method (defined for when skeleton is a List object).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

relist
showMethods("relist")
selectMethod("relist", c("ANY", "ANY")) # the default method
Replicate elements of a vector-like object

Description

rep.int replicates the elements in x.

NOTE: This man page is for the rep.int S4 generic function defined in the BiocGenerics package. See ?base::rep.int for the default method (defined in the base package). Bioconductor packages can define specific methods for objects (typically vector-like) not supported by the default method.

Usage

rep.int(x, times)

Arguments

x The object to replicate (typically vector-like).

times See ?base::rep.int for a description of this argument.

Value

See ?base::rep.int for the value returned by the default method.

Specific methods defined in Bioconductor packages will typically return an object of the same class as the input object.

See Also

• base::rep.int for the default rep.int, intersect, and setdiff methods.

• showMethods for displaying a summary of the methods defined for a given generic function.

• selectMethod for getting the definition of a specific method.

• rep.int,Rle-method in the S4Vectors package for an example of a specific rep.int method (defined for Rle objects).

• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

rep.int
showMethods("rep.int")
selectMethod("rep.int", "ANY") # the default method
residuals

Extract model residuals

Description

residuals is a generic function which extracts model residuals from objects returned by modeling functions.

NOTE: This man page is for the residuals S4 generic function defined in the BiocGenerics package. See ?stats::residuals for the default method (defined in the stats package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

residuals(object, ...)

Arguments

object, ... See ?stats::residuals.

Value

Residuals extracted from the object object.

See Also

- stats:::residuals for the default residuals method.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- residuals,PLMset-method in the affyPLM package for an example of a specific residuals method (defined for PLMset objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

residuals
showMethods("residuals")
selectMethod("residuals", "ANY") # the default method

row+colnames

Row and column names

Description

Get or set the row or column names of a matrix-like object.

NOTE: This man page is for the rownames, `rownames<-`, colnames, and `colnames<-` S4 generic functions defined in the BiocGenerics package. See ?base::rownames for the default methods (defined in the base package). Bioconductor packages can define specific methods for objects (typically matrix-like) not supported by the default methods.
Usage

rownames(x, do.NULL=TRUE, prefix="row")  
rownames(x) <- value

colnames(x, do.NULL=TRUE, prefix="col")  
colnames(x) <- value

Arguments

x
A matrix-like object.

do.NULL, prefix
See ?base::rownames for a description of these arguments.

value
Either NULL or a character vector equal of length equal to the appropriate dimension.

Value

The getters will return NULL or a character vector of length nrow(x) for rownames and length ncol(x) for colnames(x).

See ?base::rownames for more information about the default methods, including how the setters are expected to behave.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default methods.

See Also

• base::rownames for the default rownames, `rownames<-`, colnames, and `colnames<-` methods.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• rownames,DataFrame-method in the S4Vectors package for an example of a specific rownames method (defined for DataFrame objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

```r
## rownames getter:
rownames # note the dispatch on the 'x' arg only
showMethods("rownames")
selectMethod("rownames", "ANY") # the default method

## rownames setter:
rownames<-  
showMethods("rownames<-")
selectMethod("rownames<-", "ANY") # the default method

## colnames getter:
colnames # note the dispatch on the 'x' arg only
showMethods("colnames")
selectMethod("colnames", "ANY") # the default method

## colnames setter:
```
S3-classes-as-S4-classes

Description

Some old-style (aka S3) classes are turned into formally defined (aka S4) classes by the BiocGenerics package. This allows S4 methods defined in Bioconductor packages to use them in their signatures.

Details

S3 classes currently turned into S4 classes:

- connection class and subclasses: connection, file, url, gzfile, bzfile, unz, pipe, fifo, sockconn, terminal, textConnection, gzipcon. Additionally the characterORconnection S4 class is defined as the union of classes character and connection.
- others: AsIs, dist

See Also

setOldClass and setClassUnion in the methods package.

---

score

Score accessor

Description

Get or set the score value contained in an object.

Usage

score(x, ...)  
score(x, ...) <- value

Arguments

x  
An object to get or set the score value of.

...  
Additional arguments, for use in specific methods.

value  
The score value to set on x.
See Also

- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `score.GenomicRanges-method` in the `GenomicRanges` package for an example of a specific `score` method (defined for `GenomicRanges` objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
score
showMethods("score")

`score<-`
showMethods("score<-")

library(GenomicRanges)

showMethods("score")
selectMethod("score", "GenomicRanges")

showMethods("score<-")
selectMethod("score<-", "GenomicRanges")
```

---

sets *Set operations*

Description

Performs set union, intersection and (asymmetric!) difference on two vector-like objects.

NOTE: This man page is for the `union`, `intersect` and `setdiff` S4 generic functions defined in the `BiocGenerics` package. See `?base::union` for the default methods (defined in the `base` package). Bioconductor packages can define specific methods for objects (typically vector-like) not supported by the default methods.

Usage

```r
union(x, y, ...)
intersect(x, y, ...)
setdiff(x, y, ...)
```

Arguments

- `x, y` Vector-like objects (typically of the same class, but not necessarily).
- `...` Additional arguments, for use in specific methods.

Value

See `?base::union` for the value returned by the default methods.

Specific methods defined in Bioconductor packages will typically return an object of the same class as the input objects.
**Note**

The default methods (defined in the base package) only take 2 arguments. We’ve added the argument to the generic functions defined in the BiocGenerics package so they can be called with an arbitrary number of effective arguments. For union or intersect, this typically allows Bioconductor packages to define methods that compute the union or intersection of more than 2 objects. However, for setdiff, which is conceptually a binary operation, this typically allows methods to add extra arguments for controlling/altering the behavior of the operation. Like for example the ignore.strand argument supported by the setdiff method for GenomicRanges objects (defined in the GenomicRanges package). (Note that the union and intersect methods for those objects also support the ignore.strand argument.)

**See Also**

- base::union for the default union, intersect, and setdiff methods.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

**Examples**

```r
union
showMethods("union")
selectMethod("union", c("ANY", "ANY")) # the default method

intersect
showMethods("intersect")
selectMethod("intersect", c("ANY", "ANY")) # the default method

setdiff
showMethods("setdiff")
selectMethod("setdiff", c("ANY", "ANY")) # the default method
```

---

**sort**  

**Sorting a vector-like object**

**Description**

Sort a vector-like object into ascending or descending order.

NOTE: This man page is for the sort S4 generic function defined in the BiocGenerics package. See ?base::sort for the default method (defined in the base package). Bioconductor packages can define specific methods for objects not supported by the default method.

**Usage**

```r
sort(x, decreasing=FALSE, ...)
```
Arguments

x A vector-like object.
decreasing, ...

See ?base::sort for a description of these arguments.

Value

See ?base::sort for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

Note

TO DEVELOPERS:

See note in ?BiocGenerics::order about "stable" order.

order, sort, and rank methods for specific vector-like objects should adhere to the same underlying order that should be conceptually defined as a binary relation on the set of all possible vector values. For completeness, this binary relation should also be incarnated by a <= method.

See Also

• base::sort for the default sort method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• sort,Vector-method in the S4Vectors package for an example of a specific sort method (defined for Vector objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

sort # note the dispatch on the 'x' arg only
showMethods("sort")
selectMethod("sort", "ANY") # the default method

Description

Get or set the start, end, or width of an object.

NOTE: This man page is for the start, `start<-`, end, `end<-`, width, and `width<-` S4 generic functions defined in the BiocGenerics package. See ?stats::start for the start and end S3 generics defined in the stats package.
Usage

\begin{verbatim}
start(x, ...)  # start getter
start(x, ...) <- value  # start setter

end(x, ...)  # end getter
end(x, ...) <- value  # end setter

width(x)  # width getter
width(x, ...) <- value  # width setter
\end{verbatim}

Arguments

- **x**: An object containing start, end, and width values.
- **...**: Additional arguments, for use in specific methods.
- **value**: The start, end, or width values to set on \( x \).

Value

See specific methods defined in Bioconductor packages.

See Also

- `stats::start` in the `stats` package for the `start` and `end` S3 generics.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `start,IRanges-method` in the `IRanges` package for examples of specific `start`, `end`, and `width` methods (defined for `IRanges` objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

\begin{verbatim}
## start getter:
start
showMethods("start")

library(IRanges)
showMethods("start")
selectMethod("start", "IRanges")  # start getter for IRanges objects

## start setter:
'start<-' 
showMethods("start<-")
selectMethod("start<-", "IRanges")  # start setter for IRanges objects

## end getter:
end
showMethods("end")
selectMethod("end", "IRanges")  # end getter for IRanges objects

## end setter:
'end<-' 
showMethods("end<-")
selectMethod("end<-", "IRanges")  # end setter for IRanges objects
\end{verbatim}
strand

Accessing strand information

Description

Get or set the strand information contained in an object.

Usage

strand(x, ...)
strand(x, ...) <- value

unstrand(x)

invertStrand(x)

## S4 method for signature 'ANY'
invertStrand(x)

Arguments

x An object containing strand information.
...

value The strand information to set on x.

Details

All the strand methods defined in the GenomicRanges package use the same set of 3 values (called the "standard strand levels") to specify the strand of a genomic location: +, -, and *. * is used when the exact strand of the location is unknown, or irrelevant, or when the "feature" at that location belongs to both strands.

Note that unstrand is not a generic function, just a convenience wrapper to the generic strand setter (strand<-) that does:

    strand(x) <- "*"
    x

The default method for invertStrand does:

    strand(x) <- invertStrand(strand(x))
    x
Value
If x is a vector-like object, strand(x) will typically return a vector-like object parallel to x, that is, an object of the same length as x where the i-th element describes the strand of the i-th element in x.
unstrand(x) and invertStrand(x) return a copy of x with the strand set to "*" for unstrand or inverted for invertStrand (i.e. "+" and "-" switched, and "*" untouched).

See Also

- selectMethod for getting the definition of a specific method.
- strand.GRanges-method in the GenomicRanges package for an example of a specific strand method (defined for GRanges objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples
strand
showMethods("strand")

`strand<-`
showMethods("strand<-")

unstrand
invertStrand
showMethods("invertStrand")
selectMethod("invertStrand", "ANY") # the default method

library(GenomicRanges)

showMethods("strand")
selectMethod("strand", "missing")
strand()

showMethods("strand<-")

subset Subsetting vector-like, matrix-like and data-frame-like objects

Description
Return subsets of vector-like, matrix-like or data-frame-like objects which meet conditions.

NOTE: This man page is for the subset S4 generic function defined in the BiocGenerics package. See ?base::subset for the subset S3 generic defined in the base package.

Usage
subset(x, ...)

subset55
Value
If x is a vector-like object, strand(x) will typically return a vector-like object parallel to x, that is, an object of the same length as x where the i-th element describes the strand of the i-th element in x.
unstrand(x) and invertStrand(x) return a copy of x with the strand set to "*" for unstrand or inverted for invertStrand (i.e. "+" and "-" switched, and "*" untouched).

See Also
- showMethods for displaying a summary of the methods defined for a given generic function.

- strand.GRanges-method in the GenomicRanges package for an example of a specific strand method (defined for GRanges objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples
strand
showMethods("strand")

`strand<-`
showMethods("strand<-")

unstrand
invertStrand
showMethods("invertStrand")
selectMethod("invertStrand", "ANY") # the default method

library(GenomicRanges)

showMethods("strand")
selectMethod("strand", "missing")
strand()

showMethods("strand<-")

subset Subsetting vector-like, matrix-like and data-frame-like objects

Description
Return subsets of vector-like, matrix-like or data-frame-like objects which meet conditions.

NOTE: This man page is for the subset S4 generic function defined in the BiocGenerics package. See ?base::subset for the subset S3 generic defined in the base package.

Usage
subset(x, ...)

subset55
Value
If x is a vector-like object, strand(x) will typically return a vector-like object parallel to x, that is, an object of the same length as x where the i-th element describes the strand of the i-th element in x.
unstrand(x) and invertStrand(x) return a copy of x with the strand set to "*" for unstrand or inverted for invertStrand (i.e. "+" and "-" switched, and "*" untouched).

See Also
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- strand.GRanges-method in the GenomicRanges package for an example of a specific strand method (defined for GRanges objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples
strand
showMethods("strand")

`strand<-`
showMethods("strand<-")

unstrand
invertStrand
showMethods("invertStrand")
selectMethod("invertStrand", "ANY") # the default method

library(GenomicRanges)

showMethods("strand")
selectMethod("strand", "missing")
strand()

showMethods("strand<-")

subset Subsetting vector-like, matrix-like and data-frame-like objects

Description
Return subsets of vector-like, matrix-like or data-frame-like objects which meet conditions.

NOTE: This man page is for the subset S4 generic function defined in the BiocGenerics package. See ?base::subset for the subset S3 generic defined in the base package.

Usage
subset(x, ...)

subset55
Value
If x is a vector-like object, strand(x) will typically return a vector-like object parallel to x, that is, an object of the same length as x where the i-th element describes the strand of the i-th element in x.
unstrand(x) and invertStrand(x) return a copy of x with the strand set to "*" for unstrand or inverted for invertStrand (i.e. "+" and "-" switched, and "*" untouched).

See Also
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- strand.GRanges-method in the GenomicRanges package for an example of a specific strand method (defined for GRanges objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples
strand
showMethods("strand")

`strand<-`
showMethods("strand<-")

unstrand
invertStrand
showMethods("invertStrand")
selectMethod("invertStrand", "ANY") # the default method

library(GenomicRanges)

showMethods("strand")
selectMethod("strand", "missing")
strand()

showMethods("strand<-")

subset Subsetting vector-like, matrix-like and data-frame-like objects

Description
Return subsets of vector-like, matrix-like or data-frame-like objects which meet conditions.

NOTE: This man page is for the subset S4 generic function defined in the BiocGenerics package. See ?base::subset for the subset S3 generic defined in the base package.

Usage
subset(x, ...)
Arguments

x  A vector-like, matrix-like or data-frame-like object to be subsetted.

... Additional arguments (e.g. subset, select, drop), for use in specific methods. See ?base::subset for more information.

Value

An object similar to x containing just the selected elements (for a vector-like object), or the selected rows and columns (for a matrix-like or data-frame-like object).

See Also

• base::subset in the base package for the subset S3 generic.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• subset.DataTable-method in the S4Vectors package for an example of a specific subset method (defined for DataTable objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

subset
showMethods("subset")
selectMethod("subset", "ANY")  # the default method

library(S4Vectors)
showMethods("subset")
selectMethod("subset", "DataTable")  # the "subset" method for # DataTable objects

---

t  Matrix Transpose

Description

Given a rectangular object x, t returns the transpose of x.

NOTE: This man page is for the t S4 generic function defined in the BiocGenerics package. See ?base::t for the default method (defined in the base package). Bioconductor packages can define specific methods for objects (typically array-like) not supported by the default method.

Usage

t(x)

Arguments

x  a rectangular object, like a matrix or data frame
Value

See ?base::t for the value returned by the default method.

Specific methods defined in Bioconductor packages will typically return an object of the same class as the input object.

See Also

- base::t for the default t method.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- t,Hits-method in the S4Vectors package for an example of a specific t method (defined for Hits objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

t
showMethods("t")
selectMethod("t", "ANY")  # the default method

Description

table uses the cross-classifying factors to build a contingency table of the counts at each combination of factor levels.

NOTE: This man page is for the table S4 generic function defined in the BiocGenerics package. See ?base::table for the default method (defined in the base package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

table(...)

Arguments

... One or more objects which can be interpreted as factors (including character strings), or a list (or data frame) whose components can be so interpreted.

Value

See ?base::table for the value returned by the default method.

Specific methods defined in Bioconductor packages should also return the type of object returned by the default method.
**See Also**

- `base::table` for the default `table` method.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `table,Rle-method` in the `S4Vectors` package for an example of a specific `table` method (defined for `Rle` objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

**Examples**

```r
library(S4Vectors)

# default method
table
showMethods("table")
selectMethod("table", "ANY") # the default method
```

---

**tapply**

Apply a function over a ragged array

**Description**

tapply applies a function to each cell of a ragged array, that is to each (non-empty) group of values given by a unique combination of the levels of certain factors.

NOTE: This man page is for the `tapply` S4 generic function defined in the `BiocGenerics` package. See `?base::tapply` for the default method (defined in the `base` package). Bioconductor packages can define specific methods for objects (typically list-like or vector-like) not supported by the default method.

**Usage**

tapply(X, INDEX, FUN=NULL, ..., simplify=TRUE)

**Arguments**

- **X**: The default method expects an atomic object, typically a vector. See `?base::tapply` for the details.

Specific methods can support other objects (typically list-like or vector-like). Please refer to the documentation of a particular method for the details.

- **INDEX**: The default method expects a list of one or more factors, each of same length as `X`. See `?base::tapply` for the details.

Specific methods can support other objects (typically list-like). Please refer to the documentation of a particular method for the details.

- **FUN, ...**, **simplify**: See `?base::tapply` for a description of these arguments.

**Value**

See `?base::tapply` for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.
See Also
- `base::tapply` for the default `tapply` method.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `tapply,Vector,ANY-method` in the `IRanges` package for an example of a specific `tapply` method (defined for `Vector` objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
tapply  # note the dispatch on the 'X' and 'INDEX' args only
showMethods("tapply")
selectMethod("tapply", c("ANY", "ANY"))  # the default method
```

testPackage  

Run RUnit package unit tests

Description

`testPackage` helps developers implement unit tests using the `RUnit` testing conventions.

Usage

```r
testPackage(pkgname=NULL, subdir="unitTests", pattern="^test_.*\.R$", path=getwd())
```

Arguments

- `pkgname`  
The name of the package whose installed unit tests are to be run. A missing or `NULL` value implies that the `testPackage` command will look for tests within the package source directory indicated by `path`.

- `subdir`  
A character(1) vector providing the subdirectory in which unit tests are located. The directory is searched first in the (installed or source) package root, or in a subdirectory `inst/` below the root.

- `pattern`  
A character(1) regular expression describing the file names to be evaluated; typically used to restrict tests to a subset of all test files.

- `path`  
A character(1) directory path indicating, when `pkgname` is missing or `NULL`, where unit tests will be searched. `path` can be any location at or below the package root.

Details

This function is not exported from the package namespace, and must be invoked using triple colons, `BiocGenerics:::testPackage()`; it is provided primarily for the convenience of developers.

When invoked with missing or `NULL` `pkgname` argument, the function assumes that it has been invoked from within the package source tree (or that the source tree is located above `path`), and finds unit tests in `subdir="unitTests"` in either the base or `inst/` directories at the root of the package source tree. This mode is useful when developing unit tests, since the package does not have to be re-installed to run an updated test.

When invoked with `pkgname` set to the name of an installed package, unit tests are searched for in the installed package directory.
unique

Value

The function returns the result of RUnit::runTestSuite invoked on the unit tests specified in the function call.

See Also

http://bioconductor.org/developers/how-to/unitTesting-guidelines/

Examples

## Run unit tests found in the library location where
## BiocGenerics is installed
BiocGenerics:::testPackage("BiocGenerics")
## Not run: ## Run unit tests for the package whose source tree implied
## by getwd()
BiocGenerics:::testPackage()

## End(Not run)

unique

Extract unique elements

Description

unique returns an object of the same class as x (typically a vector-like, data-frame-like, or array-like object) but with duplicate elements/rows removed.

NOTE: This man page is for the unique S4 generic function defined in the BiocGenerics package. See ?base::unique for the default method (defined in the base package). Bioconductor packages can define specific methods for objects (typically vector-like or data-frame-like) not supported by the default method.

Usage

unique(x, incomparables=FALSE, ...)

Arguments

x

A vector-like, data-frame-like, or array-like object.

incomparables, ...

See ?base::unique for a description of these arguments.

Value

See ?base::unique for the value returned by the default method.

Specific methods defined in Bioconductor packages will typically return an object of the same class as the input object.

unique should always behave consistently with BiocGenerics::duplicated.
unlist

See Also

- `base::unique` for the default unique method.
- `BiocGenerics::duplicated` for determining duplicate elements.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `unique,Rle-method` in the `S4Vectors` package for an example of a specific unique method (defined for `Rle` objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

Examples

```r
unique
showMethods("unique")
selectMethod("unique", "ANY")  # the default method
```

| unlist               | Flatten list-like objects |

Description

Given a list-like object `x`, `unlist` produces a vector-like object obtained by concatenating (conceptually thru `c`) all the top-level elements in `x` (each of them being expected to be a vector-like object, typically).

NOTE: This man page is for the `unlist S4 generic function` defined in the `BiocGenerics` package. See `?base::unlist` for the default method (defined in the `base` package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

```r
unlist(x, recursive=TRUE, use.names=TRUE)
```

Arguments

- `x` A list-like object.
- `recursive`, `use.names`

See `?base::unlist` for a description of these arguments.

Value

See `?base::unlist` for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

See Also

- `base::unlist` for the default unlist method.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `unlist,List-method` in the `S4Vectors` package for an example of a specific unlist method (defined for `List` objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.
**Examples**

```
unlist   # note the dispatch on the 'x' arg only
showMethods("unlist")
selectMethod("unlist", "ANY")  # the default method
```

---

**unsplit**

*Unsplit a list-like object*

**Description**

Given a list-like object `value` and grouping `f`, `unsplit` produces a vector-like object `x` by conceptually reversing the split operation `value <- split(x, f)`.

NOTE: This man page is for the `unsplit` S4 generic function defined in the `BiocGenerics` package. See `?base::unsplit` for the default method (defined in the `base` package). Bioconductor packages can define specific methods for objects not supported by the default method.

**Usage**

```
unsplit(value, f, drop=FALSE)
```

**Arguments**

- `value` A list-like object.
- `f` A factor or other grouping object that corresponds to the `f` symbol in `value <- split(x, f)`.
- `drop` See `?base::unsplit` for a description of this argument.

**Value**

See `?base::unsplit` for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

**See Also**

- `base::unsplit` for the default unsplit method.
- `showMethods` for displaying a summary of the methods defined for a given generic function.
- `selectMethod` for getting the definition of a specific method.
- `unsplit.List-method` in the `IRanges` package for an example of a specific unsplit method (defined for `List` objects).
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

**Examples**

```
unsplit   # note the dispatch on the 'value' and 'f' args only
showMethods("unsplit")
selectMethod("unsplit", "ANY")  # the default method
```
updateObject

Update an object to its current class definition

Description

updateObject is a generic function that returns an instance of object updated to its current class definition.

Usage

updateObject(object, ..., verbose=FALSE)

## Related utilities:
updateObjectFromSlots(object, objclass=class(object), ..., verbose=FALSE)
getObjectSlots(object)

Arguments

object Object to be updated for updateObject and updateObjectFromSlots.
Object for slot information to be extracted from for getObjectSlots.

... Additional arguments, for use in specific updateObject methods.

verbose TRUE or FALSE, indicating whether information about the update should be reported. Use message to report this information.

objclass Optional character string naming the class of the object to be created.

Details

Updating objects is primarily useful when an object has been serialized (e.g., stored to disk) for some time (e.g., months), and the class definition has in the mean time changed. Because of the changed class definition, the serialized instance is no longer valid.

updateObject requires that the class of the returned object be the same as the class of the argument object, and that the object is valid (see validObject). By default, updateObject has the following behaviors:

updateObject(ANY, ..., verbose=FALSE) By default, updateObject uses heuristic methods to determine whether the object should be the ‘new’ S4 type (introduced in R 2.4.0), but is not. If the heuristics indicate an update is required, the updateObjectFromSlots function tries to update the object. The default method returns the original S4 object or the successfully updated object, or issues an error if an update is required but not possible. The optional named argument verbose causes a message to be printed describing the action. Arguments ... are passed to updateObjectFromSlots.

updateObject(list, ..., verbose=FALSE) Visit each element in list, applying updateObject(list[[elt]], ..., verbose=FALSE)
updateObject(environment, ..., verbose=FALSE) Visit each element in environment, applying updateObject(environment[[elt]], ..., verbose=verbose)
updateObject(formula, ..., verbose=FALSE) Do nothing; the environment of the formula may be too general (e.g., R_GlobalEnv) to attempt an update.
updateObject(envRefClass, ..., verbose=FALSE) Attempt to update objects from fields using a strategy like updateObjectFromSlots Method 1.
updateObjectFromSlots(object, objclass=class(object), ..., verbose=FALSE) is a utility function that identifies the intersection of slots defined in the object instance and objclass definition. Under Method 1, the corresponding elements in object are then updated (with updateObject(elt, ..., verbose=verbose)) and used as arguments to a call to new(class, ...), with ... replaced by slots from the original object. If this fails, then Method 2 tries new(class) and assigns slots of object to the newly created instance.

getObjectSlots(object) extracts the slot names and contents from object. This is useful when object was created by a class definition that is no longer current, and hence the contents of object cannot be determined by accessing known slots.

Value

updateObject returns a valid instance of object.
updateObjectFromSlots returns an instance of class objclass.
getObjectSlots returns a list of named elements, with each element corresponding to a slot in object.

See Also

• updateObjectTo in the Biobase package for updating an object to the class definition of a template (might be useful for updating a virtual superclass).
• validObject for testing the validity of an object.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.

Examples

updateObject
showMethods("updateObject")
selectMethod("updateObject", "ANY") # the default method

library(Biobase)
## update object, same class
data(sample.ExpressionSet)
obj <- updateObject(sample.ExpressionSet)

setClass("UpdtA", representation(x="numeric"), contains="data.frame")
setMethod("updateObject", "UpdtA",
  function(object, ..., verbose=FALSE)
  {
    if (verbose)
      message("updateObject object = 'A'")
    object <- callNextMethod()
    object@x <- -object@x
    object
  }
)

a <- new("UpdtA", x=1:10)
## See steps involved
updateObject(a)
Description

var and sd compute the variance and standard deviation of a vector \( x \).

NOTE: This man page is for the \texttt{var} and \texttt{sd} \textit{S4 generic functions} defined in the \texttt{BiocGenerics} package. See \texttt{?stats::var} and \texttt{?stats::sd} for the default methods (defined in the \texttt{stats} package). Bioconductor packages can define specific methods for objects (typically array-like) not supported by the default method.

Usage

\begin{verbatim}
var(x, y = NULL, na.rm = FALSE, use)
sd(x, na.rm = FALSE)
\end{verbatim}

Arguments

\begin{itemize}
\item \texttt{x} \hspace{1cm} a vector-like object
\item \texttt{y} \hspace{1cm} a vector-like object, or \texttt{NULL}
\item \texttt{na.rm}, \texttt{use} \hspace{1cm} see \texttt{var}
\end{itemize}

Value

See \texttt{?stats::var} and \texttt{?stats::sd} for the value returned by the default methods.

Specific methods defined in Bioconductor packages will typically return an object of the same class as the input object.

See Also

\begin{itemize}
\item \texttt{stats::var} and \texttt{stats::sd} for the default methods.
\item \texttt{showMethods} for displaying a summary of the methods defined for a given generic function.
\item \texttt{selectMethod} for getting the definition of a specific method.
\item \texttt{BiocGenerics} for a summary of all the generics defined in the \texttt{BiocGenerics} package.
\end{itemize}

Examples

\begin{verbatim}
var
showMethods("var")
selectMethod("var", "ANY")  # the default method
\end{verbatim}
weights  

*Extract model weights*

**Description**

`weights` is a generic function which extracts fitting weights from objects returned by modeling functions.

NOTE: This man page is for the `weights S4 generic function` defined in the `BiocGenerics` package. See `?stats::weights` for the default method (defined in the `stats` package). Bioconductor packages can define specific methods for objects not supported by the default method.

**Usage**

`weights(object, ...)`

**Arguments**

`object, ...`  See `?stats::weights`.

**Value**

Weights extracted from the object `object`.  
See `?stats::weights` for the value returned by the default method.

Specific methods defined in Bioconductor packages should behave as consistently as possible with the default method.

**See Also**

- `stats::weights` for the default weights method.  
- `showMethods` for displaying a summary of the methods defined for a given generic function.  
- `selectMethod` for getting the definition of a specific method.  
- `weights.PLMset-method` in the `affyPLM` package for an example of a specific `weights` method (defined for `PLMset` objects).  
- `BiocGenerics` for a summary of all the generics defined in the `BiocGenerics` package.

**Examples**

```
weights
showMethods("weights")
selectMethod("weights", "ANY") # the default method
```
which

Subscript generators

Description

These functions all return a vector of subscripts into their input.

NOTE: This man page is for the which, which.max and which.min S4 generic functions defined in the BiocGenerics package. See ?base::which and ?base::which.min for the default methods (defined in the base package). Bioconductor packages can define specific methods for objects (typically vector-like) not supported by the default methods.

Usage

which(x, arr.ind = FALSE, useNames = TRUE, ...)  
which.max(x, ...)  
which.min(x, ...)

Arguments

- **x**  
  Vector-like object, logical for which, numeric for the others.
- **arr.ind**, **useNames**  
  Additional arguments, for use in specific methods.
- **...**  
  Additional arguments, for use in specific methods.

Value

See ?base::which and ?base::which.min for the value returned by the default methods.

Specific methods defined in Bioconductor packages will typically return an object of the same class as the input objects.

Note

The default methods (defined in the base package) only take a fixed set of arguments. We've added the ... argument to the generic functions defined in the BiocGenerics package so they can be called with an arbitrary number of effective arguments. This typically allows methods to add extra arguments for controlling/altering the behavior of the operation. Like for example the global argument supported by the which.max method for NumericList objects (defined in the IRanges package).

See Also

- base::which for the default which, base::which.min for the others.
- showMethods for displaying a summary of the methods defined for a given generic function.
- selectMethod for getting the definition of a specific method.
- which.max.NumericList-method in the IRanges package for an example of a specific which.max method (defined for NumericList objects).
- BiocGenerics for a summary of all the generics defined in the BiocGenerics package.
Examples

which
showMethods("which")
selectMethod("which", c("ANY", "ANY")) # the default method

which.max
showMethods("which.max")
selectMethod("which.max", c("ANY", "ANY")) # the default method

which.min
showMethods("which.min")
selectMethod("which.min", c("ANY", "ANY")) # the default method

xtabs Cross tabulation

Description

xtabs creates a contingency table (optionally a sparse matrix) from cross-classifying factors, usually contained in a data-frame-like object, using a formula interface.

NOTE: This man page is for the xtabs S4 generic function defined in the BiocGenerics package. See ?stats::xtabs for the default method (defined in the stats package). Bioconductor packages can define specific methods for objects not supported by the default method.

Usage

xtabs(formula=~., data=parent.frame(), subset, sparse=FALSE, na.action, exclude=c(NA, NaN), drop.unused.levels=FALSE)

Arguments

formula, subset, sparse, na.action, exclude, drop.unused.levels
See ?stats::xtabs for a description of these arguments.

data A data-frame-like object.

Value

See ?stats::xtabs for the value returned by the default method.

Specific methods defined in Bioconductor packages should also return the type of object returned by the default method.

See Also

• stats::xtabs for the default xtabs method.
• showMethods for displaying a summary of the methods defined for a given generic function.
• selectMethod for getting the definition of a specific method.
• xtabs.DataTable-method in the S4Vectors package for an example of a specific xtabs method (defined for DataTable objects).
• BiocGenerics for a summary of all the generics defined in the BiocGenerics package.
Examples

xtabs  # note the dispatch on the 'data' arg only
showMethods("xtabs")
selectMethod("xtabs", "ANY")  # the default method
