1 Introduction

RGraph2js provides a powerful HTML visualizer to navigate and manipulate graphs/networks. This package has been designed to display results from in-house algorithms on biological networks [1], where it is required to associate a plot for each node [2]. The package is not limited to this specific usage since it is a general tool to visualize various types of networks. RGraph2js is highly customizable and offers a user-friendly interface.

Included features are:

- Interactive visualization tool (pan, zoom)
- Customizable appearance
- Customizable graph layout
- Different node connection types support
- Tooltips support
- Node dragging
- Export as a Scalable Vector Graphics (SVG\(^1\)) image
- Barplots and starplots displayable inside the nodes
- Compatibility with most platforms and browsers
- The generated interactive graph can be easily shared

RGraph2js takes the description of a graph/network as input and generates an HTML page the user can open in any recent web browser with SVG (Scalable Vector Graphics) rendering support to visualize it and interact with it.

![Figure 1: Overview](image)

1.1 Technology

The D3js[3] (Data-Driven Documents) JavaScript library is used to render graphs/networks. Raphael[5] is another JavaScript library used to render specific in-nodes plots like starplots. JQuery[4] and JQueryUI[6] are used for the graphical interface and the user interactions. qTip2[7], a JQuery plugin, is used to render advanced tooltips. A SVG (Scalable Vector Graphics) capable browser is required since both D3js and Raphael generate SVG code.

comment: An Internet connection is required in order to use external third-party JavaScript libraries, further information is given in the next section

\(^{1}\)https://en.wikipedia.org/wiki/Scalable_Vector_Graphics
1.2 External third-party libraries

_D3js_ , _jQuery_ , _JQueryUI_ , _qTip2_ and _Raphael_ are used via _CDNJS_ , the links are:

http://cdnjs.cloudflare.com/ajax/libs/jquery/1.11.0/jquery.min.js
http://cdnjs.cloudflare.com/ajax/libs/jqueryui/1.10.3/jquery-ui.min.js
http://cdnjs.cloudflare.com/ajax/libs/qtip2/2.2.0/basic/jquery.qtip.min.js
http://cdnjs.cloudflare.com/ajax/libs/qtip2/2.2.0/basic/imagesloaded.pkg.min.js
http://cdnjs.cloudflare.com/ajax/libs/d3/3.5.6/d3.min.js
http://cdnjs.cloudflare.com/ajax/libs/raphael/2.1.4/raphael-min.js
http://cdnjs.cloudflare.com/ajax/libs/jqueryui/1.10.3/css/base/minified/jquery-ui.min.css
http://cdnjs.cloudflare.com/ajax/libs/qtip2/2.2.0/basic/jquery.qtip.min.css

The above URLs are declared in the function _RGraph2js:::getDefaultToolParameters_().

1.3 Input

The graph/network is defined with a signed and weighted adjacency matrix or with the following R objects from the _graph_ package:

- graphAM
- graphBAM
- graphNEL
- clusterGraph

Considering the matrix _a35_:

```r
v <- c(0, 4, 1,
+       1, 0, 0,
+       -1, 0, 0,
+       0, -2, 0,
+       0, 1, 0)
> a35 <- matrix(v, 3, 5)
> colnames(a35) <- LETTERS[1:5]
> rownames(a35) <- LETTERS[1:3]
```

... its graphical representation would be as follows:

![Figure 2: Graph representation](image-url)
Table 1: 3x5 Signed Weighted Adjacency Matrix

Reading the adjacency matrix by rows, gives the following links/edges:

Line 1: [A → B], [A → C]
Line 2: [B → A], [B → D], [B → E]
Line 3: [C → A]

In the adjacency matrix, a value of
- 0 means "no connection"
- 1 "→" "arrow, directional connection"
- -1 "-" "dot, directional connection"

Comment: Any bidirectional connection of the same type implies an undirected link marked as "–"

[A → B] and [B → A] ⇒ [A – B]

Comment: Any loop connection, when a node connects with itself, will not be graphically represented.
Comment: Edges weights can be directly specified in the adjacency matrix as real numbers.

1.4 Output

The result files will be made available in a temporary folder or in a specified folder of your choice. The folder will contain:

- A folder for the images
- The main HTML file
- A JavaScript library

Figure 3: Output folder content
2 Examples

2.1 Simple Example

This example will show the basics, we will generate a simple network given an adjacency matrix.

Define the adjacency matrix `a1515`:

```r
> library(RGraph2js)
> v <- c(1,1,1,0,0,0,0,0,0,0,0,0,0,0,0,
+ 1,1,0,1,1,0,0,0,0,0,0,0,0,0,0,
+ 1,0,0,0,0,0,0,0,0,0,0,0,0,0,0,
+ 0,1,0,1,1,0,0,0,0,1,0,0,0,0,0,
+ 0,1,0,1,1,0,0,0,1,0,0,0,0,0,0,
+ 0,0,0,0,0,1,1,0,0,0,0,0,0,0,0,
+ 0,0,0,0,0,1,0,0,0,0,0,0,0,0,0,
+ 0,0,0,0,0,0,1,0,0,0,0,0,0,0,0,
+ 0,0,0,0,0,0,1,0,0,0,0,0,0,0,0,
+ 0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,
+ 0,0,0,1,0,0,0,0,0,1,0,0,0,0,0,
+ 0,0,0,0,0,0,0,0,0,0,1,0,0,0,0,
+ 0,0,0,1,0,0,0,0,0,0,0,1,0,0,0,
+ 0,0,0,0,0,0,0,0,0,0,0,0,0,0,1,
+ 0,0,0,0,0,0,0,0,0,0,0,0,0,0,1)
>
> a1515 <- matrix(v, 15, 15)
> colnames(a1515) <- LETTERS[1:15]
> rownames(a1515) <- LETTERS[1:15]
```

</tbody>
</table>

Define the output destination folder `outputDir` and generate the graph with the function `graph2js()`

```r
> outputDir <- file.path(tempdir(), "RGraph2js_simpleExample")
> g <- graph2js(a1515, outputDir=outputDir)
```

Open the `outputDir` in your browser and click on the html file. You should be able to see something similar to this:
2.2 Visual appearance

In the previous example, we only specified the adjacency matrix. This example will show how to customize the visual appearance of both nodes and links.

The properties of edges (links) can be specified globally or for each edge. `edgesGlobal` below is applied to all edges, where `edgesProp` is only applied to the edges D to E, D to B and B to E.

```r
> edgesGlobal <- list(width=2, color="#0000ff")
> edgesProp <- data.frame(from=c("D", "D", "B"),
+ to=c("E", "B", "E"),
+ width=c(5, 5, 5))
```

We can also define `edgesProp` by starting with its default value returned by the function `getEdgesDataFrame()`. The first column is an automatically generated unique identifier, followed by the columns `from`, `to` and `type` which are automatically set according to the given adjacency matrix `a1515`. `color`, `width`, `link` and `tooltip` have default values we can customize.

- **color**: edge color formatted as hex RGB
- **width**: edge tickness
- **link**: URL associated with the edge
- **tooltip**: tooltip content with HTML support

```r
> getEdgesDataFrame(a1515)
```

<table>
<thead>
<tr>

</tbody>
</table>

Figure 4: Simple example
Similarly, node properties can be global or specific.

```r
> nodesGlobal <- list(color="#ebebeb")
> nodesProp <- data.frame(shape=c("triangle", "lozenge", "rect"),
+ color=c("#ff0000", "#0000ff", "#ffff00"))
> rovnames(nodesProp) <- c("C", "E", "G")
```

Since `nodesProp` holds node specific properties, row names are mandatory. We can call the `getNodesDataFrame()` to define `nodesProp`. The returned data frame contains default values for each node.

- **color**: color of the node in hex RGB format
- **shape**: the shape to use ("rect", "circle", "lozenge", "triangle")
- **link**: URL associated with the node
- **tooltip**: tooltip content with HTML support

```r
> getNodesDataFrame(A=a1515, nGlobal=nodesGlobal, nProp=nodesProp)

   width color shape link  tooltip
  A   1    ebebeb   circle
  B   1    ebebeb   circle
  C   1    ff0000  triangle
  D   1    ebebeb   circle
  E   1    0000ff  lozenge
  F   1    ebebeb   circle
  G   1    ffff00  rect
  H   1    ebebeb   circle
  I   1    ebebeb   circle
  J   1    ebebeb   circle
  K   1    ebebeb   circle
  L   1    ebebeb   circle
  M   1    ebebeb   circle
  N   1    ebebeb   circle
```

Although node properties can be global or specific.
Call the `graph2js()` function as before and specify both nodes and edges properties.

```r
> outputDir <- file.path(tempdir(), "RGraph2js_visualAppearance")
> g <- graph2js(a1515,
+   nodesGlobal=nodesGlobal, edgesGlobal=edgesGlobal,
+   nodesProp=nodesProp, edgesProp=edgesProp,
+   outputDir=outputDir, file="index.html")
```

Going further, several options can be changed via the `opts` parameter of the function `graph2js()`. `opts` defaults to the value returned by the function `getDefaultOptions()`.

Please check out the manual for further details.
2.3 Fixed node positions

We start from a simple adjacency matrix:

```r
v <- c(0, 0, 1,
       1, 0, 0,
       0, 0, 0,
       0, -1, 0,
       0, 1, 0)
> a35 <- matrix(v, 3, 5)
> colnames(a35) <- LETTERS[1:5]
> rownames(a35) <- LETTERS[1:3]
```

Then, we specify node coordinates via the node properties. x and y represent the Cartesian coordinates, and `fixed` means they are immutable.

```r
r <- 100
sector <- 2*pi/5
n.prop <- data.frame(
  x=c(r*cos(1*sector), r*cos(2*sector), r*cos(3*sector),
       r*cos(4*sector), r*cos(5*sector)),
  y=c(r*sin(1*sector), r*sin(2*sector), r*sin(3*sector),
       r*sin(4*sector), r*sin(5*sector)),
  fixed=c(TRUE,TRUE,TRUE,TRUE,TRUE)
)
> rownames(n.prop) <- c("A","B","C","D","E")
```

Now, we render the graphics.

```r
outputDir <- file.path(tempdir(), "RGraph2js_fixedNodes")
g <- graph2js(a35, nodesProp=n.prop, outputDir=outputDir)
```

![Fixed Node Coordinates Graph](image)
2.4 Time data or categories

*RGraph2js* implements a time-step functionality where, at each step, a different set of nodes can be highlighted with thicker borders and different colors. Each time-step is specified by an index starting at 1 and the highlighted nodes and their colors are specified by a dataframe as explained below.

Take for instance the following graph definition:

```r
> v <- c(0, 0, 1,
+ 1, 0, 0,
+ 0, 0, 0,
+ 0, -1, 0,
+ 0, 1, 0)
> a35 <- matrix(v, 3, 5)
> colnames(a35) <- LETTERS[1:5]
> rownames(a35) <- LETTERS[1:3]
```

We specify 4 time-steps in the dataframe below using 2 prefixes:
- *leading.nodes.index* specifies the nodes to highlight with thicker border
- *highlight.index* specifies the colors for those leading nodes.

```r
> numnodes <- 5
> nodesProp <- data.frame(leading.nodes.1=rbinom(numnodes, 1, 1/2),
+ leading.nodes.2=rbinom(numnodes, 1, 1/2),
+ leading.nodes.3=rbinom(numnodes, 1, 1/2),
+ leading.nodes.4=rbinom(numnodes, 1, 1/2),
+ highlight.1=rainbow(numnodes),
+ highlight.2=rainbow(numnodes),
+ highlight.3=rainbow(numnodes),
+ highlight.4=rainbow(numnodes))
> rownames(nodesProp) <- LETTERS[1:5]
```

Rendering the Graph leads to:

```r
> outputDir <- file.path(tempdir(), "RGraph2js_timeData")
> g <- graph2js(a35,
+ nodesProp=nodesProp,
+ outputDir=outputDir)
```

![Figure 7: 4 Different states](image)

Clicking on the *IN* button will expand a new panel at the bottom containing a slider to navigate across the time steps.
2.5 Rendering barplots inside nodes

```r
v <- c(0, 0, 1, 1, 0, 0, 0, 0, 0, 0, -1, 0, 0, 1, 0)
a35 <- matrix(v, 3, 5)
colnames(a35) <- LETTERS[1:5]
rownames(a35) <- LETTERS[1:3]
```

The `innerValues` parameter allows us to specify a barplot for each node and `innerColors` represent the bar colors. The order in both parameters is important for the barplots rendering.

```r
numnodes <- 5
innerValues <- matrix(runif(numnodes * 8), numnodes, 8)
colnames(innerValues) <- LETTERS[1:5]
rownames(innerValues) <- LETTERS[1:5]
innerColors <- matrix(rainbow(numnodes * 8), numnodes, 8)
colnames(innerColors) <- LETTERS[1:5]
```

After rendering, here is the result:

![Figure 8: Barplots inside nodes](image)

An alternate solution would be to display the barplot inside the node tooltips only, as shown below:

```r
opts <- getDefaultOptions()
opts$displayBarPlotsInsideNodes <- FALSE
opts$barplotInNodeTooltips <- TRUE
g <- graph2js(a35,
              innerValues=innerValues,
              innerColors=innerColors,
              outputDir=outputDir)
```
2.6 Rendering starplots inside nodes

```r
> v <- c(0, 0, 1,
+ 1, 0, 0,
+ 0, 0, 0,
+ 0, -1, 0,
+ 0, 1, 0)
> a35 <- matrix(v, 3, 5)
> colnames(a35) <- LETTERS[1:5]
> rownames(a35) <- LETTERS[1:3]
Define a starplot for each node. Each starplot has several parameters: the value (which determines its radius), the opacity, the color, the label, a URL and a tooltip. Additionally, a color and opacity can be specified for the starplot background.
```
```r
> numnodes <- 5
> starplotValues <- matrix(runif(numnodes * 8), numnodes, 8)
> rownames(starplotValues) <- LETTERS[1:5]
> starplotColors <- matrix(rainbow(numnodes * 8), numnodes, 8)
> rownames(starplotColors) <- LETTERS[1:5]
> labels <- c("Sector1", "Sector2", "Sector3", "Sector4",
+ "Sector5", "Sector6", "Sector7", "Sector8")
> starplotLabels <- matrix(labels, numnodes, 8)
> rownames(starplotLabels) <- LETTERS[1:5]
> starplotTooltips <- matrix(labels, numnodes, 8)
> rownames(starplotTooltips) <- LETTERS[1:5]
> # add a url link for each sector
+ "http://cran.r-project.org", "http://journal.r-project.org")
> starplotUrlLinks <- matrix(urls, numnodes, 8)
> rownames(starplotUrlLinks) <- LETTERS[1:5]
> starplotCircleFillColor <- matrix(rainbow(numnodes), numnodes, 1)
> rownames(starplotCircleFillColor) <- LETTERS[1:5]
> starplotCircleFillOpacity <- matrix(runif(numnodes, 0, 1), numnodes, 1)
> rownames(starplotCircleFillOpacity) <- LETTERS[1:5]
```

Render the Graph:
```r
> outputDir <- file.path(tempdir(), "RGraph2js_starplots")
> output.filename <- "test.html"
```
> g <- graph2js(A=a35, 
+     starplotColors=starplotColors, 
+     starplotLabels=starplotLabels, 
+     starplotValues=starplotValues, 
+     starplotTooltips=starplotTooltips, 
+     starplotUrlLinks=starplotUrlLinks, 
+     starplotCircleFillColor=starplotCircleFillColor, 
+     starplotCircleFillOpacity=starplotCircleFillOpacity, 
+     outputDir=outputDir, 
+     filename=output.filename)

**Figure 10: Starplots**

*comment: Moving the mouse over the sectors will display a tooltip showing the sector name or label*
*comment: Clicking on a sector will open the associated URL*
2.7 Customizing the tooltip content

```r
> v <- c(0, 0, 1,
+       1, 0, 0,
+       0, 0, 0,
+       0, -1, 0,
+       0, 1, 0)
> a35 <- matrix(v, 3, 5)
> colnames(a35) <- LETTERS[1:5]
> rownames(a35) <- LETTERS[1:3]
```

The content of the tooltip can be defined with the `nodesProperties` parameter which fully supports HTML content.

```r
comment: We can even add images like any other HTML content
```

```r
> numnodes <- 5
> someHtmlContent <- c(paste0("<table class="gridtable">
+ "\<tr\><th>Header 1</th><th>Header 2</th><th>Header 3</th></tr><tr><td>Text 1,1</td><td>Text 1,2</td><td>Text 1,3</td></tr><tr><td>Text 2,1</td><td>Text 2,2</td><td>Text 2,3</td></tr></table>
+ ",
+ "This is another i\<content\>i\</content\> content\</i\>",
+ "Yet another \<font style="color:#00ff00;">one</font>",
+ paste0("<table",
+ "\<tr\><th>Header 1</th><th>Header 2</th><th>Header 3</th></tr><tr><td>Text 1,1</td><td>Text 1,2</td><td>Text 1,3</td></tr><tr><td>Text 2,1</td><td>Text 2,2</td><td>Text 2,3</td></tr></table>",
+ "\<h1\>Header 1\</h1><h2\>Header 2\</h2>")
```

```r
> n.prop <- data.frame(tooltip=someHtmlContent)
> rownames(n.prop) <- LETTERS[1:5]
```

Since we specified a custom style `gridtable`, we can define it that way:

```r
> userCssStyles <- "
+ <style type="text/css">
+ table.gridtable {
+   font-family: verdana,arial,sans-serif;
+   font-size:11px;
+   color:#333333;
+   border-width: 1px;
+   border-color: #666666;
+   border-collapse: collapse;
+ }
+ table.gridtable th {
+   border-width: 1px;
+   padding: 8px;
+   border-style: solid;
+   border-color: #666666;
+   background-color: #dedede;
+ }
+ table.gridtable td {
+   border-width: 1px;
+   padding: 8px;
+   border-style: solid;
+   border-color: #666666;
+   background-color: #ffffff;
+ }
+ </style>
```

Renderer the Graph and provide custom styles with the `userCssStyles` parameter:

```r
> outputDir <- file.path(tempdir(), "RGraph2js_tooltipContent")
> g <- graph2js(a35,
+     opts=opts,
+     nodesProp=n.prop,
+     userCssStyles=userCssStyles,
+     outputDir=outputDir)
```

The 5 tooltips will be rendered as follows:

![Figure 11: Custom Tooltips](image)
2.8 Use the DOT description language

This example requires the sna\cite{8} package which allows us to easily get an adjacency matrix from a DOT file: \cite{9}.

```r
> library(sna)
> extdata.path <- file.path(path.package(package="RGraph2js"), "extdata")
> dot.file.path <- file.path(extdata.path, "nohosts.dot")
> adj.mat <- read.dot(dot.file.path)
```

Since the graph is rather large, we can save computing resources by displaying the graph every 100 iterations only, with the option `displayNetworkEveryNLayoutIterations`. Setting it at "zero" would mean to display the graph upon completion only.

```r
> opts <- getDefaultOptions()
> opts$displayNetworkEveryNLayoutIterations <- 100
> opts$displayNodeLabels <- FALSE
> opts$layout_forceCharge <- -2400
> nodesGlobal <- list(color="#5544ff")
> outputDir <- file.path(tempdir(), "RGraph2js_dot")
> g <- graph2js(A=adj.mat,
+               nodesGlobal=nodesGlobal,
+               opts=opts,
+               outputDir=outputDir)
```

![Figure 12: Generate a network from a DOT file](http://www.graphviz.org/doc/info/lang.html)
2.9 Use a graph class

Instead of specifying an adjacency matrix, you can pass a graph class.

Here is an example with a graphNEL object gnel:

```r
> library(graph)
> nodes <- c("A", "B", "C", "D", "E")
> edges <- list(
+   A=list(edges=c("A", "B"), weights=c(2, 2)),
+   B=list(edges=c("A", "E"), weights=c(0.25, 0.25)),
+   C=list(edges=c("A", "D"), weights=c(4, 4)),
+   D=list(edges=c("E"), weights=c(6)),
+   E=list(edges=c("A", "B"), weights=c(1, 1))
+ )
> gnel <- new("graphNEL", nodes=nodes, edgeL=edges, edgemode="directed")
```

The following shows how to graphically represent edges weights with the Rgraphviz package. As you can see, some extra steps are required.

```r
> ew <- as.character(unlist(edgeWeights(gnel)))
> ew <- ew[setdiff(seq(along = ew), removedEdges(gnel))]
> names(ew) <- edgeNames(gnel)
> eAttrs <- list()
> eAttrs$label <- ew
> plot(gnel,
+   attrs=list(
+     edge=list(arrowsize=0.5)
+   ),
+   edgeAttrs=eAttrs)
```

Now, with RGraph2js, edges weights are translated into edges width by default. This default behaviour can be redefined by specifying edges properties.

```r
> outputDir <- file.path(tempdir(), "RGraph2js_graphNELExample")
> g <- graph2js(A=gnel, outputDir=outputDir)
```

Please note the following limitations:

- links/edges representations are only translatable into "→" or "–"
- as mentioned earlier, loop connections are not rendered

3 Interactions

3.1 Using the bottom panel buttons

All buttons are described in the next sections.

![Buttons bottom panel](image)

**Figure 14: Buttons bottom panel**

3.1.1 Search

The search field performs an incremental search on all node labels, highlighting matches with a tick red border. Clearing the search field cancels the search and resets the display.

![Search field](image)

**Figure 15: Search field**

![Search feature in action](image)

**Figure 16: Search feature in action**

3.1.2 About dialog

Gives information about the software and its version

3.1.3 Reload

Re-compute the layout
3.1.4 Layout settings

Toggle the sub-panel to customize the layout engine.

![Layout Settings](image)

Figure 17: Layout Settings

The parameters the user can control with sliders are:
- Charge
- Link distance

More details about the force layout can be found on the D3js wiki \(^3\).

3.1.5 Export

Lets you export the graph and save it as an SVG image.

![Export As popup menu](image)

Figure 18: "Export As" popup menu

3.1.6 Zoom

Zoom in/out without using the mouse wheel.

3.1.7 Leading nodes

Expand a new panel at the bottom containing a slider to navigate across the time steps. Please note this button is present only when such data exist.

![Leading nodes](image)

Figure 19: Layout Settings

---

\(^3\)https://github.com/mbostock/d3/wiki/Force-Layout
3.1.8 Dragging nodes

Toggle the nodes dragging feature

Figure 20: Dragging a node

3.1.9 Node neighbors

Enable the highlight of the neighbors when hovering a node

Figure 21: Highlighting of the neighbors
3.1.10 Tooltips

Toggle the display of Tooltips when the mouse hovers a node or an edge.

Below is an example of a node tooltip containing the node name with a barplot.

![Tooltip Example](image)

Figure 22: Tooltips

3.1.11 Magnify

Magnify the view area to fit to the browser current window size.

3.2 Using the Mouse

![Mouse Buttons](image)

Figure 23: Mouse Buttons

Button (1) is used to drag the whole graph in the drawing area and to drag nodes when the corresponding mode is activated. Double-clicking performs a zoom in.

Button (2) opens a popup menu when clicking a node.
Figure 24: Node Popup Menu

Button (3), the mouse wheel allows to zoom in and out.
