

# Package ‘AffyRNADegradation’

August 18, 2017

**Type** Package

**Title** Analyze and correct probe positional bias in microarray data due to RNA degradation

**Version** 1.22.0

**Date** 2012-09-26

**Depends** R (>= 2.9.0), methods, affy

**Suggests** AmpAffyExample

**Author** Mario Fasold

**Maintainer** Mario Fasold <fasold@izbi.uni-leipzig.de>

**Description** The package helps with the assessment and correction of RNA degradation effects in Affymetrix 3' expression arrays. The parameter `d` gives a robust and accurate measure of RNA integrity. The correction removes the probe positional bias, and thus improves comparability of samples that are affected by RNA degradation.

**License** GPL-2

**Collate** AllClasses.R decayFunction.R AffyRNADegradation.R probeInfo.R tongs.R

**biocViews** GeneExpression, Microarray, OneChannel, Preprocessing, QualityControl

**NeedsCompilation** no

AffyDegradationBatch-class

*Class AffyDegradationBatch*

---

### Description

This class represents Affymetrix GeneChip probe level data that has been analysed and corrected for the probe location bias.

### Objects from the Class

Objects can be created using the function `RNADegradation`.

### Slots

`location.type`: Object of class `character` describing the type of probe position used for the analysis (probe index or probe location).

`afbatch`: Object of class `AffyBatch` containing corrected probe level data.

`stats`: Object of class `matrix` containing various statistical parameters from the analysis.

`means.pm`: Object of class `matrix` containing the average PM probe intensities for probe locations of expressed genes.

`means.mm`: Object of class `matrix` containing the average MM probe intensities for probe locations of expressed genes.

### Methods

**afbatch** signature(`x = "AffyDegradationBatch"`): returns as `AffyBatch` object containing corrected probe level data.

**d** signature(`x = "AffyDegradationBatch"`): returns a vector with a measure of RNA degradation for each sample

**plotDx** signature(`x = "AffyDegradationBatch"`): plots the probe location bias for all samples of the experiment.

### Examples

```
if (require(AmpAffyExample)) {  
  # Get example data  
  data(AmpData)  
  
  affy.deg <- RNADegradation(AmpData[,4])  
  
  ## Plot degradation
```

```
plotDx(affy.deg)

## Get degradation measure
d(affy.deg)

## Get AffyBatch object with corrected probe intensities
afbatch(affy.deg)
}
```

---

AffyRNADegradation      *AffyRNADegradation: analyze and correct RNA degradation effects*

---

## Description

The AffyRNADegradation package helps in the assessment of RNA degradation effects in Affymetrix 3' expression arrays. The parameter `d` gives a robust and accurate measure of RNA integrity. The correction removes the probe positional bias, and thus improves comparability of samples that are affected by RNA degradation.

## Details

Package: AffyRNADegradation  
Type: Package  
Version: 0.1.0  
Date: 2011-10-13  
License: GPL >=2

The RNADegradation function performs both analysis and correction of RNA degradation effects, returning an object of type `AffyDegradationBatch`. The class provides accessor functions to obtain the degradation parameter `d` and a `AffyBatch` object containing corrected probe intensities. A more detailed look on the RNA degradation effects can be gained through the `tongs` plot, the `Dx` plot and further statistics.

Mario Fasold

## Examples

```
if (require(AmpAffyExample)) {
  # Load example data (AmpData affybatch)
  data(AmpData)

  ## Compute and correct degradation for a single chip (for speed)
  affy.deg <- RNADegradation(AmpData[,4])

  ## Show degradation parameter d
  d(affy.deg)

  ## Replace data with corrected data for further analysis
  AmpData <- afbatch(affy.deg)
}
```

```
}
```

---

GetTongs

*Generate and visualize the tongs plot*

---

### Description

The tongs plot and the related degradation hook show the relationship between expression level and probe location bias. They are required for the correct estimation of RNA degradation effects.

### Usage

```
GetTongs(affyData, chip.idx = 1)
PlotTongs(tongs)
PlotDegradationHooks(affyData, ...)
```

### Arguments

<code>affyData</code>	an AffyBatch object.
<code>chip.idx</code>	index of the sample to compute the tongs for.
<code>tongs</code>	the tongs plot data table.
<code>...</code>	optional graphical parameters.

### Value

<code>Tongs</code>	a table containing Tongs plot values ordered by expression level.
--------------------	---

### Author(s)

Mario Fasold

### Examples

```
if (require(AmpAffyExample)) {
  # Get example data
  data(AmpData)

  tongs <- GetTongs(AmpData, chip.idx = 4)
  PlotTongs(tongs)

  PlotDegradationHooks(AmpData[,c(3,4)])
}
```

---

**RNADegradation***Compute degradation parameters and correct probe intensities*

---

**Description**

Given an `AffyBatch` object, the function `RNADegradation` computes the probe positional bias and several statistical parameters, including a robust and accurate measure of RNA degradation. Probe intensities are corrected for the bias for each sample within the `AffyBatch` object.

**Usage**

```
RNADegradation(affyData,  
               location.type = "index",  
               location.file.dir = NULL,  
               plot.images = FALSE)
```

**Arguments**

<code>affyData</code>	an <code>AffyBatch</code> object containing the probe level microarray data.
<code>location.type</code>	index-based probe alignment ( <code>x=k</code> ) if "index", or location-based alignment ( <code>x=L</code> ) if "absolute".
<code>location.file.dir</code>	directory containing the probe location file(s).
<code>plot.images</code>	if <code>TRUE</code> plots a set of debug images.

**Value**

An `AffyDegradationBatch` object.
