Package ‘AffyRNAKeywords’

January 31, 2017

Type Package

Title Analyze and correct probe positional bias in microarray data due to RNA degradation

Version 1.20.0

Date 2012-09-26

Depends R (>= 2.9.0), methods, affy

Suggests AmpAffyExample

Author Mario Fasold

Maintainer Mario Fasold <fasold@izbi.uni-leipzig.de>

Description The package helps with the assessment and correction of RNA degradation effects in Affymetrix 3’ expression arrays. The parameter d gives a robust and accurate measure of RNA integrity. The correction removes the probe positional bias, and thus improves comparability of samples that are affected by RNA degradation.

AffyDegradationBatch-class

Class `AffyDegradationBatch`

Description

This class represents Affymetrix GeneChip probe level data that has been analysed and corrected for the probe location bias.

Objects from the Class

Objects can be created using the function `RNADegradation`.

Slots

- `location.type`: Object of class character describing the type of probe position used for the analysis (probe index or probe location).
- `afbatch`: Object of class `AffyBatch` containing corrected probe level data.
- `stats`: Object of class `matrix` containing various statistical parameters from the analysis.
- `means.pm`: Object of class `matrix` containing the average PM probe intensites for probe locations of expressed genes.
- `means.mm`: Object of class `matrix` containing the average MM probe intensites for probe locations of expressed genes.

Methods

- `afbatch` signature(`x = "AffyDegradationBatch"`): returns as `AffyBatch` object containing corrected probe level data.
- `d` signature(`x = "AffyDegradationBatch"`): returns a vector with a measure of RNA degradation for each sample
- `plotDx` signature(`x = "AffyDegradationBatch"`): plots the probe location bias for all samples of the experiment.

`AffyBatch`

Examples

```r
if (require(AmpAffyExample)) {
  # Get example data
  data(AmpData)

  affy.deg <- RNADegradation(AmpData[,4])

  ## Plot degradation
```
### Description

The `AffyRNADegradation` package helps in the assessment of RNA degradation effects in Affymetrix 3' expression arrays. The parameter d gives a robust and accurate measure of RNA integrity. The correction removes the probe positional bias, and thus improves comparability of samples that are affected by RNA degradation.

### Details

- **Package:** AffyRNADegradation
- **Type:** Package
- **Version:** 0.1.0
- **Date:** 2011-10-13
- **License:** GPL >=2

The `RNADegradation` function performs both analysis and correction of RNA degradation effects, returning an object of type `AffyDegradationBatch`. The class provides accessor functions to obtain the degradation parameter d and a `AffyBatch` object containing corrected probe intensities. A more detailed look on the RNA degradation effects can be gained through the tongs plot, the Dx plot and further statistics.

Mario Fasold

### Examples

```r
if (require(AmpAffyExample)) {
  # Load example data (AmpData affybatch)
  data(AmpData)

  ## Compute and correct degradation for a single chip (for speed)
  affy.deg <- RNADegradation(AmpData[,4])

  ## Show degradation parameter d
  d(affy.deg)

  ## Replace data with corrected data for further analysis
  AmpData <- afbatch(affy.deg)
```
GetTongs

*Generate and visualize the tongs plot*

**Description**

The tongs plot and the related degradation hook show the relationship between expression level and probe location bias. They are required for the correct estimation of RNA degradation effects.

**Usage**

```r
GetTongs(affyData, chip.idx = 1)
PlotTongs(tongs)
PlotDegradationHooks(affyData, ...)
```

**Arguments**

- **affyData**: an AffyBatch object.
- **chip.idx**: index of the sample to compute the tongs for.
- **tongs**: the tongs plot data table.
- **...**: optional graphical parameters.

**Value**

- **Tongs**: a table containing Tongs plot values ordered by expression level.

**Author(s)**

Mario Fasold

**Examples**

```r
if (require(AmpAffyExample)) {
  # Get example data
data(AmpData)

tongs <- GetTongs(AmpData, chip.idx = 4)
PlotTongs(tongs)
PlotDegradationHooks(AmpData[,c(3,4)])
}
```
RNADegradation

Compute degradation parameters and correct probe intensities

Description
Given an AffyBatch object, the function RNADegradation computes the probe positional bias and several statistical parameters, including a robust and accurate measure of RNA degradation. Probe intensities are corrected for the bias for each sample within the AffyBatch object.

Usage
RNADegradation(affyData, 
location.type = "index", 
location.file.dir = NULL, 
plot.images = FALSE)

Arguments
affyData an AffyBatch object containing the probe level microarray data.
location.type index-based probe alignment (x=k) if "index", or location-based alignment (x=L) if "absolute".
location.file.dir directory containing the probe location file(s).
plot.images if TRUE plots a set of debug images.

Value
An AffyDegradationBatch object.
