**Description**

Differential expression analysis using the linear model features implemented in the limma package. A linear model is fitted to each miRNA gene so that the fold change between different experimental conditions and their standard errors can be estimated. Empirical Bayes methods are applied to obtain moderated statistics.

**Usage**

```
basicLimma(eset, design, CM, verbose = FALSE)
```

**Arguments**

- `eset` ExpressionSet containing the processed log-expression values
- `design` design matrix
- `CM` contrast matrix
- `verbose` logical, if TRUE prints out output

**Details**

In our data example (see the target file in Table 1 in vignette), we have used a paired design (by subject) to assess the differential expression between two treatments B and C vs a control treatment A. That is, we want to obtain the microRNAs that are differentially expressed between conditions A vs B and A vs C. The linear model that we are going to fit to every miRNA is defined by equation: $y = \text{Treatment} + \text{Subject} + \text{error term}$. This model is going to estimate the treatment effect and then, the comparison between the different treatments are done in terms of contrasts between the estimates of the treatment effects. To fit the model, we need first to define a design matrix. The design matrix is an incidence matrix that relates each array/sample/file to its given experimental conditions, in our case, relates each file to one of the three treatments and with its particular subject. If treatment is a factor variable, we can define de desing matrix using `model.matrix(~ -1 + treatment + subject)`. Then the linear model can be fitted using `fit=lmFit(eset,design)`. This will get the treatment estimates for each microRNA in the eset object:

```
treatmentA treatmentB treatmentC subject2 hsa-miR-152 7.5721 7.656 7.566 -0.1157 hsa-miR-15a* 0.9265 1.066 1.211 -0.2242 hsa-miR-337-5p 6.2448 7.298 7.084 -0.4489
```
We can define the contrasts of interest using a contrast matrix as in:

```r
CM = cbind(MSC_AvsMSC_B = c(1, -1, 0), MSC_AvsMSC_C = c(1, 0, -1))
```

And then, we can estimate those contrasts using:

```r
fit2 = contrasts.fit(fit, CM).
```

Finally, we can obtain moderated statistics using:

```r
fit2 = eBayes(fit2).
```

The function 'basicLimma' implemented in AgiMicroRna produces the last fit2 object, that has in fit2$coeff the M values, in fit$t the moderated-t statistic of the contrasts, and in fit2$Sp.value the corresponding p value of each particular contrasts. Be aware that these p values must be corrected by multiple testing.

```r
MSC_AvsMSC_B MSC_AvsMSC_C hsa-miR-152 0.67567761 0.977326746 hsa-miR-15a* 0.68019442 0.413657270 hsa-miR-337-5p 0.03737814 0.075248741
```

See limmaUsersGuide() for a complete description of the limma package.

### Value

An MArrayLM object of the package limma

### Author(s)

Pedro Lopez-Romero

### References

### See Also

abline(h=c(-1,1),col="red")
plot(fit2$coeff[,1],fit2$p.value[,1], xlab="M",ylab="p value")

## End(Not run)
cvArray

Coefficient of variation of replicated probes within array

Description

Identifies replicated features at probe and at gene level and computes the coefficient of variation of the array

Usage

cvArray(ddDUP, foreground = c("MeanSignal", "ProcessedSignal"), targets, verbose=FALSE)

Arguments

ddDUP uRNAList, containing the output from readMicroRnaAFE
foreground Specifies the signal used, only "MeanSignal" or "ProcessedSignal" can be used
targets data.frame with the target structure
verbose logical, if TRUE prints out output

Details

In the Agilent microRNA platforms the features are replicated at a probe level and normally, a single microRNA is interrogated by either two or four sets of replicated probes. The replication of the probes allows computing the coefficient of variation (CV) for each array as a measure of the reproducibility of the array. The CV is computed for every set of replicated probes and the CV median is reported as the array CV. A lower array CV indicates a better array reproducibility.

Value

It prints out the results of the replication for the NON CONTROL FEATURES at a probe and gene level.

Author(s)

Pedro Lopez-Romero

Examples

## Not run:
data(dd.micro)
data(targets.micro)
cvArray(dd.micro,"MeanSignal",targets.micro,verbose=TRUE)
graphics.off()
## End(Not run)
**Description**

Data, extracted from scanned images using Agilent Feature Extraction Software, are stored in a uRNAList object.

**Usage**

```r
data(dd.micro)
```

**Details**

A data example is provided. The data example includes 3 experimental conditions with two replicates.

For these data, chips were scanned using the Agilent G2567AA Microarray Scanner System (Agilent Technologies) Image analysis and data collection were carried out using the Agilent Feature Extraction 9.1.3.1. (AFE).

Data, collected with the Agilent Feature Extraction Software, are stored in a uRNAList object with the following components:

- `uRNAList$TGS` matrix, ‘gTotalGeneSignal’
- `uRNAList$TPS` matrix, ‘gTotalProbeSignal’
- `uRNAList$meanS` matrix, ‘gMeanSignal’
- `uRNAList$procS` matrix, ‘gProcessedSignal’
- `uRNAList$targets` data.frame, ‘FileName’
- `uRNAList$genes$ProbeName` vector of characters, ‘AGilent Probe Name’
- `uRNAList$genes$GeneName` vector of characters, ‘microRNA Name’
- `uRNAList$genes$ControlType` vector of integers, ’0’= Feature, ’1’= Positive control, ’-1’= Negative control
- `uRNAList$other$gIsGeneDetected` matrix, FLAG to classify signal if ’IsGeneDetected=1’ or ’not=0’
- `uRNAList$other$gIsSaturated` matrix, FLAG to classify signal if ’IsSaturated = 1’ or ’not=0’
- `uRNAList$other$gIsFeatPopnOL` matrix, FLAG to classify signal if ’IsFeatPopnOL = 0’ or ’not=1’
- `uRNAList$other$gIsFeatNonUnifOL` matrix, FLAG to classify signal if ’gIsFeatNonUnifOL = 0’ or ’not=1’
- `uRNAList$other$gBGMedianSignal` matrix, gBGMedianSignal
- `uRNAList$other$gBGUsed` matrix, gBGUsed

Pedro Lopez-Romero

**See Also**

`readMicroRnaAFE.Rd`
**ddPROC**

*Processed miRNA data (uRNAList)*

---

**Description**

Filtered and Normalized miRNA data stored in a uRNAList object.

**Usage**

data(ddPROC)

**Details**

ddPROC is originated after the processing of the dd.micro raw data.

**Author(s)**

Pedro Lopez-Romero

**See Also**

An overview of how ddPROC is obtained is given in `filterMicroRna`

---

**dim.uRNAList**

*Retrieve the Dimensions of an uRNAList Object*

---

**Description**

Retrieve the number of rows (genes) and columns (arrays) for an uRNAList object.

**Usage**

```r
## S3 method for class 'uRNAList'
dim(x)
## S3 method for class 'uRNAList'
length(x)
```

**Arguments**

- `x` an object of class uRNAList

**Details**

This function and this file, has been borrowed from the files created by Gordon Smyth for the limma package.

**Value**

Numeric vector of length 2. The first element is the number of rows (genes) and the second is the number of columns (arrays).
Author(s)
Pedro Lopez-Romero

---

dimnames.uRNAList Retrieve the Dimension Names of an uRNAList Object

Description
Retrieve the dimension names of a microarray data object.

Usage
```r
## S3 method for class 'uRNAList'
dimnames(x)
## S3 replacement method for class 'uRNAList'
dimnames(x) <- value
```

Arguments
- `x`: an object of class uRNAList
- `value`: a possible value for dimnames(x)

Details
The dimension names of a microarray object are the same as those of the most important matrix component of that object. A consequence is that rownames and colnames will work as expected. This function and this file, has been borrowed from the files created by Gordon Smyth for the limma package.

Value
Either NULL or a list of length 2.

Author(s)
Pedro Lopez-Romero

---
esetMicroRna ExpressionSet object from a uRNAList

Description
It creates an 'ExpressionSet' object from a 'uRNAList' with unique probe names. Typically, the 'uRNAList object' contains the Total Gene Processed data.

Usage
```r
esetMicroRna(uRNAList, targets, makePLOT=FALSE, verbose=FALSE)
```
Arguments

uRNAList  An uRNAList containing normally the processed data
targets    data.frame with the targets structure
makePLOT   logical, if TRUE it makes a 'heatmap' with the 100 greater variance genes, a 'hierarchical cluster' with all the genes and a pca plot
verbose    logical, if TRUE prints out output

Details

It creates an ExpressionSet object from a uRNAList. Usually this function is applied to an uRNAList object containing the Total Gene Processed data.

Value

An ExpressionSet object

Author(s)

Pedro Lopez-Romero

See Also

An 'uRNAList' example containing processed data is in ddPROC and an overview of how the processed data is produced is given in filterMicroRna

Description

Filter genes out according to their Quality Flag

Usage

filterMicroRna(ddNORM, dd, control, IsGeneDetected, wellaboveNEG, limIsGeneDetected, limNEG, makePLOT, targets, verbose, writeout)
Arguments

- **ddNORM**: uRNAList with the Total Gene Signal in log2 scale to be FILTERED out according to a Quality FLAG
- **dd**: uRNAList, containing the output from `readMicroRnaAFE`
- **control**: logical, if TRUE it removes controls
- **IsGeneDetected**: logical, if TRUE it filters genes according to gIsGeneDetected Flag. Flag = 1, then gene is detected
- **wellaboveNEG**: logical, if TRUE it filter genes whose expression is not above a limit value defined by the expression of negative controls. Limit = Mean(negative) + 1.5 x sd(negative)
- **limIsGeneDetected**: for a given feature xi accros samples, is the minimum in at least one experimental condition with a IsGeneDetected-FLAG = 1 (Is Detected)
- **limNEG**: for a given feature xi accros samples, is the minimum in at least one experimental condition with intensity > Limit established for negative controls (Mean + 1.5 x SD)
- **makePLOT**: logical, if TRUE makes QC plots with the remaining signals
- **targets**: data.frame with the targets structure
- **verbose**: logical, if TRUE prints out output
- **writeout**: logical, if TRUE writes out output files

Details

Agilent Feature Extraction software provides a flag for each spot that identifies different quantification errors of the signal. Quantification flags were used to filter out signals that did not reach a minimum established criterion of quality.

Value

The function returns a uRNAList containing the FILTERED data. In order to allow the tracking of those microRNAs that may have been filtered out from the original raw data, the following files are given:

- NOCtrl\_exprs.txt: Log2 Normalized Total Gene Signals for the Non Control Genes
- NOCtrl\_FlagIsGeneDetected.txt: IsGeneDetected Flag for the Non Control Genes
- IsNOTGeneDetected.txt: Genes that not are not detected according to IsGeneDetected Flag

Author(s)

Pedro Lopez-Romero

References

Examples

```r
data(dd.micro,verbose=FALSE)
data(targets.micro,verbose=FALSE)
ddTGS=tgsMicroRna(dd.micro,half=TRUE,makePLOT=FALSE,verbose=FALSE)
ddNORM=tgsNormalization(ddtGS,'quantile',
```

`filterMicroRna`
getDecideTests

Differential expression analysis an multiplicity of the tests

Description

It Uses the decideTests function of the 'limma' package to classify the list of genes as up, down or not significant after correcting by the multiplicity of the tests.

Usage

getDecideTests(fit2, DEmethod, MTestmethod, PVcut, verbose=FALSE)

Arguments

fit2 MArrayLM object
DEmethod method for decideTests, only 'separate' or 'nestedF' are implemented. see decideTests in limma package.
MTestmethod method for multiple test, choices are 'none','BH', 'BY', ... see p.adjust
PVcut p value threshold to declare significant features
verbose logical, if TRUE prints out output

Value

A 'TestResults' object of the 'limma' package It prints out the number of UP and DOWN genes for every contrasts according to the p value limit specified

Author(s)

Pedro Lopez-Romero

## Examples

```r
## Not run:
DE=getDecideTests(fit2,
  DEmethod="separate",
  MTestmethod="BH",
  PVcut=0.10,
  verbose=TRUE)
## End(Not run)
```

### Description

Creates a HeatMap graph using the `heatmap.2` function.

### Usage

```r
HeatMapMicroRna(object, size, maintitle)
```

### Arguments

- **object**: A expression Matrix
- **size**: number of highest variance genes to be considered in the plot
- **maintitle**: title of the plot

### Author(s)

Pedro Lopez-Romero

### See Also

`heatmap.2`

### Examples

```r
data(ddPROC)
HeatMapMicroRna(ddPROC$TGS,
  size=100,
  maintitle="100 High Var genes")
```
hierclusMicroRna

Hierarchical clustering

Description

Hierarchical cluster of samples using the 'hclust' function

Usage

hierclusMicroRna(object, GErep, methdis, methclu, sel, size)

Arguments

- `object`: An expression Matrix
- `GErep`: Numerical vector that relates each sample with its experimental condition
- `methdis`: the distance measure to be used. Options are 'euclidean' and 'pearson'. see 'dist' function
- `methclu`: the agglomeration method to be used by the 'hclust' function
- `sel`: logical, if TRUE selects the 'size' highest variance genes for the plot
- `size`: selects the 'size' highest variance genes for the plot if 'sel=TRUE'

Author(s)

Pedro Lopez-Romero

See Also

hclust, dist

Examples

data(targets.micro)
data(ddPROC)

hierclusMicroRna(ddPROC$TGS,GErep, methdis="euclidean", methclu="complete", sel=FALSE,100)
mvaBASIC  

**MVA plot**

**Description**

For each array, the M value is computed for every spot as the difference between the spot intensity in the array and the averaged intensity for that feature over the whole set of arrays. It does not make a distinction between the different kind of features in the array as the mvaMicroRna() does.

**Usage**

mvaBASIC(object, colorfill, maintitle)

**Arguments**

- **object**
  An expression matrix in log2 scale
- **colorfill**
  color of the plot
- **maintitle**
  title of the plot

**Author(s)**

Pedro Lopez-Romero

**Examples**

data(dd.micro)
op=par(mfrow=c(1,1),ask=TRUE)
mvaBASIC(log2(dd.micro$meanS),
colorfill="red",
maintitle=" log2 Mean Signal")
par(op)

mvaMicroRna  

**MA plot**

**Description**

For each array, the M value is computed for every spot as the difference between the spot intensity in the array and the median intensity for that feature over the whole set of arrays. Every kind of feature is identified with different color (microRNA genes, positive controls, etc ...) The input must be an uRNAList object created by the user, in such a way that the uRNAList$meanS field contains the expression matrix that we want to use in log2 scale (see example below) The gProcessedSignal computed by the Agilent Feature Extraction software normally contains negative values, so a small constant has to be added to the signals before log tranformation.

**Usage**

mvaMicroRna(uRNAList, maintitle, verbose=FALSE)
**Arguments**

- **uRNAList**: A uRNAList object. It uses the expression matrix stored in the uRNAList$meanS slot. Input expression matrix should be in log2 scale.
- **maintitle**: character to indicate the title of the graph.
- **verbose**: logical, if TRUE it prints details.

**Author(s)**

Pedro Lopez-Romero

**Examples**

```r
data(dd.micro)
op=par(mfrow=c(1,1),ask=TRUE)

MMM=dd.micro$procS ## gProcessedSignal
min=min(MMM) ## transforming gProcessedSignal to positive values
for(i in 1:dim(MMM)[2]){ ## before log2 transformation
  MMM[,i]=MMM[,i]+(abs(min)+ 5)
}

ddaux=dd.micro
ddaux$meanS=log2(MMM)
mvaMicroRna(ddaux,maintitle="ProcessedSignal",verbose=FALSE)
rm(ddaux)
par(op)
```

---

**Description**

It is a wrapper for the `plotPCA` of the `affycoretools` package.

**Usage**

```r
PCAplotMicroRna(eset, targets)
```

**Arguments**

- **eset**: An Expression Set object.
- **targets**: data.frame with the target structure.

**Author(s)**

Pedro Lopez-Romero

**Examples**

```r
data(targets.micro)
data(ddPROC)
esetPROC=eisetMicroRna(ddPROC,targets.micro,makePLOT=FALSE,verbose=FALSE)
PCAplotMicroRna(esetPROC,targets.micro)
```
plotDensityMicroRna  

*Density Plots of Intensity Signals*

**Description**

Creates a density plot with the arrays intensities

**Usage**

```r
plotDensityMicroRna(object, maintitle)
```

**Arguments**

- `object` An expression matrix, in log2 scale
- `maintitle` title of the plot

**Author(s)**

Pedro Lopez-Romero

**Examples**

```r
data(dd.micro)
plotDensity(log2(dd.micro$meanS), maintitle="log2 Mean Signal")
```

---

pvalHistogram  

*Histogram of the p values*

**Description**

Creates an histogram of the pvalues. For multiple contrats, creates an histogram for every t.test pvalue (separate) or a single histogram for the F.test pvalue (nestedF). A uniform histogram will indicate no differential expression in the data set, whereas a right skewed histogram, will indicate some significant differential expression

**Usage**

```r
pvalHistogram(fit2, DE, PVcut, DEmethod, MTestmethod, CM, verbose=FALSE)
```

**Arguments**

- `fit2` MArrayLM object
- `DE` TestResults object
- `PVcut` limit p value to declare significant features
- `DEmethod` method for decideTests, only 'separate' or 'nestedF' are implemented
- `MTestmethod` method for multiple test
- `CM` contrast matrix
- `verbose` logical, if TRUE prints out output
qcPlots

Author(s)

Pedro Lopez-Romero

See Also

An overview of miRNA differential expression analysis is given in basicLimma An example of how to get the 'TestResults' object is in getDecideTests

Examples

```r
## Not run:
pvalHistogram(fit2,DE,PVcut=0.10,
   DEmethod="separate",MTestmethod="BH",CM)
## End(Not run)
```

qcPlots

Plots for Quality Assessment

Description

It creates BoxPlots, Density Plots, MA plots, RLE plots and hierachical clustering plots with the sample data set.

Usage

```r
qcPlots(dd,
offset,
MeanSignal=TRUE,
ProcessedSignal=FALSE,
TotalProbeSignal=FALSE,
TotalGeneSignal=FALSE,
BGMedianSignal=FALSE,
BGUsed=FALSE,
targets)
```

Arguments

- **dd**: A uRNAList object containing the output from readMicroRnaAFE
- **offset**: numeric value to add to the intensities before log transforming
- **MeanSignal**: logical, if TRUE "gMeanSignal" is used
- **ProcessedSignal**: logical, if TRUE "gProcessedSignal" is used
- **TotalProbeSignal**: logical, if TRUE "gTotalProbeSignal" is used
- **TotalGeneSignal**: logical, if TRUE "gTotalGeneSignal" is used
- **BGMedianSignal**: logical, if TRUE "gBGMedianSignal" is used
- **BGUsed**: logical, if TRUE "gBGUsed" is used
- **targets**: data.frame with the target structure
Details

The signals loaded from the AFE data files can be used for the quality assessment using the graphical utilities included in the \texttt{qcPlots} function. For the \texttt{gMeanSignal}, the BoxPlots, Density Plots, MA plots, RLE plots and hierarchical clustering plots are done. For the \texttt{gProcessedSignal} the same plots are done, except the hierarchical clustering. For the \texttt{gTotalProbeSignal} and the \texttt{gTotalGeneSignal} only the BoxPlots and Density Plots are done, and finally, for the Background signals only the BoxPlots are done.

**readMicroRnaAFE**  
*Read Agilent Feature Extraction txt data files*

Description

Read the data files generated by the Agilent Feature Extraction image analysis software

Usage

```r
readMicroRnaAFE(targets, verbose=FALSE)
```
Arguments

targets A data frame that specifies experimental conditions under which each sample has been obtained.

verbose logical, if TRUE prints out output

Details

The function reads the *.txt files generated by the AFE Software using the ‘read.maimages’ function of ‘limma’ package.

Data, collected with the Agilent Feature Extraction Software, are stored in a uRNAList object with the following components:

- dd.micro\$TGS ‘gTotalGeneSignal’ - dd.micro\$TPS ‘gTotalProbeSignal’ - dd.micro\$meanS ‘gMeanSignal’
- dd.micro\$procS ‘gProcessedSignal’ - dd.micro\$targets ‘targets’ - dd.micro\$genes\$ProbeName ‘Probe Name’ - dd.micro\$genes\$GeneName ‘microRNA Name’ - dd.micro\$genes\$ControlType ‘FLAG to specify the sort of feature’ - dd.micro\$other\$gIsGeneDetected ‘FLAG IsGeneDetected’ - dd.micro\$other\$gIsSaturated ‘FLAG IsSaturated’ - dd.micro\$other\$gIsFeatNonUnifOL ‘FLAG IsFeatNonUnifOL’ - dd.micro\$other\$gIsFeatPopnOL ‘FLAG IsFeatPopnOL’ - dd.micro\$other\$gBGMedianSignal ‘gBGMedianSignal’ - dd.micro\$other\$gBGUsed ‘gBGUsed’

Value

A uRNAList containing the following elements:

uRNAList\$TGS matrix, 'gTotalGeneSignal'
uRNAList\$TPS matrix, 'gTotalProbeSignal'
uRNAList\$meanS matrix, 'gMeanSignal'
uRNAList\$procS matrix, 'gProcessedSignal'
uRNAList\$targets data.frame, 'FileName'
uRNAList\$genes\$ProbeName character, 'AGilent Probe Name'
uRNAList\$genes\$GeneName character, 'microRNA Name'
uRNAList\$genes\$ControlType integer, '0'= Feature, '-1'= Negative control
uRNAList\$other\$gIsGeneDetected matrix, FLAG to classify signal if 'IsGeneDetected=1' or 'not=0'
uRNAList\$other\$gIsSaturated matrix, FLAG to classify signal if 'IsSaturated = 1' or 'not=0'
uRNAList\$other\$gIsFeatPopnOL matrix, FLAG to classify signal if 'gIsFeatPopnOL = 0' or 'not=1'
uRNAList\$other\$gIsFeatNonUnifOL matrix, FLAG to classify signal if 'gIsFeatNonUnifOL = 0' or 'not=1'
uRNAList\$other\$gBGMedianSignal matrix, gBGMedianSignal
uRNAList\$other\$gBGUsed matrix, gBGUsed

A data example can be found in dd.micro See also readTargets to see how to build the target file and the example given in targets.micro

Examples
```r
## Not run:
data(targets.micro)
dd.micro = readMicroRnaAFE(targets.micro)
## End(Not run)
```

readTargets
read the target file

Description
The target file is a txt file created by the user where every input file (array, sample) is attached to an experimental condition

Usage
readTargets(infile, verbose=FALSE)

Arguments
infile name of the target file, for instance 'targets.micro.txt'
verbose logical, if TRUE prints out output

Details
In the 'target' file (see Table 1 in vignette) we specify the experimental conditions under which the data have been generated. The target file MUST contain the following mandatory columns:
- FileName : Name of the array data file
- Treatment : Treatment effect
- GErep : Treatment effect in numeric code, from '1' to 'n', being 'n' the number of the levels of the treatment effect
Other explanatory variables specifying the experimental conditions might be also included.

Value
A 'data.frame' containing by the columns specified in the input file targets.txt. This 'targets.txt' file must be created by the user.

<table>
<thead>
<tr>
<th>RleMicroRna</th>
<th>Relative Log Expression</th>
</tr>
</thead>
</table>

Description

RLE: Relative Log Expression

Usage

RleMicroRna(object, maintitle, colorfill)

Arguments

object An expression matrix
maintitle title of the plot
colorfill color of the plot

Details

Each Boxplot corresponds to a sample and displays the Relative Log Expression computed for every spot in the array as the difference between the spot intensity and the median intensity for the same feature accros all the arrays. Since majority of the spots are expected not to be differentially expressed, the plot should show boxplots centered around zero and all of them having the approximately the same dispersion. An array showing greater dispersion than the other, or being not centered at zero could have quality problems.

rmaMicroRna

Getting the Total Gene Signal by RMA algorithm

Description

The function creates an uRNAList containing the TotalGeneSignal computed by the RMA algorithm. This signal can be used for the statistical analysis.

Usage

rmaMicroRna(dd, normalize, background)

Arguments

dd uRNAList, containing the output from readMicroRnaAFE
normalize logical, if TRUE the signal is normalized between arrays using the 'quantile' method
background logical, if TRUE the signal is background corrected by fitting a normal + exponential convolution model to a vector of observed intensities

Details

The function creates an uRNAList output that contains in the uRNAList$TGS, uRNAList$TPS, uRNAList$meanS & uRNAList$procS slots the Total Gene Signal (TGS) computed by the RMA algorithm. The function uses the robust multiarray average (RMA) method from the 'affy' package. RMA obtains an estimate of the expression measure for each gene using all the replicated probes for that gene. First, RMA obtains a background corrected intensity by fitting a normal + exponential convolution model to a vector of observed intensities. The normal part represents the background and the exponential part represents the signal intensities. Then the arrays are normalized using 'quantile' normalization. Finally, for each probe set that interrogates the same microRNA, RMA fits a linear model to the background-corrected, normalized and log2 transformed probe intensities. This model produces an estimate of the gene signal taking into account the probe effect. The model parameters estimates are obtained by median polish. The estimates of the gene expression signals are referred as RMA estimates. Normally, each microRNA is interrogated by 16 probes either using 2 different probes, each of them replicated 8 times, or using 4 different probes replicated 4 times. First, function 'rmaMicroRna' obtains a background corrected signal using the 'rma.background.correct' function of the package 'preprocessCore', then the signal is normalized between arrays using the 'limma' function 'normalizeBetweenArrays' with the 'quantile' method. Then, the median of the replicated probes is obtained, leading to either 2 or 4 different measures for each gene. These measures correspond to different probes for the same genes that are summarized into a single RMA linear model described above.

Value

uRNAList containing the Total Gene Signal computed by the RMA algorithm in log 2 scale.
significantMicroRna

Author(s)

Pedro Lopez-Romero

References

Bolstad B. M. (). preprocessCore: A collection of pre-processing functions. R package version 1.4.0

Examples

data(dd.micro)
ddTGS.rma=rmaMicroRna(dd.micro, normalize=TRUE, background=TRUE)
dim(ddTGS.rma)
RleMicroRna(ddTGS.rma$TGS,"RLE TGS.rma","blue")

significantMicroRna  Summarize Differential Expression Results

Description

The function summarizes the results from the differential expression analysis using the different objects that are obtained after 'limma' has been used, such as the 'MArrayLM' object with the statistics and the 'TestResults' object highlighting the significant features.

Usage

significantMicroRna(eset, ddset, targets, fit2, CM, DE, DEmethod, MTestmethod, PVcut, Mcut, verbose=FALSE)

Arguments

eset  ExpressionSet containing the Total Gene processed data
ddset  An uRNAList object containing the Total Gene processed gene data
targets  data.frame with the target structure
fit2  MArrayLM object from eBayes 'limma' function
CM  Contrast matrix
DE  TestResults object
DEmethod  method used in decideTests, only 'separate' or 'nestedF' are implemented
MTestmethod  method for multiple test
PVcut  p value threshold to declare significant features
Mcut  M value threshold to select within significant features
verbose  logical, if TRUE prints out output
Details

A list containing the genes with their statistics is generated. The significant genes above the PVcut p values are also given in a html file that links the selected miRNAs to the miRBase [http://microrna.sanger.ac.uk/](http://microrna.sanger.ac.uk/). A MA plots indicating the differentially expressed genes are also displayed.

When multiple contrasts are done, the method for the selection of the significant genes can be either `separated` or `nestedF`. See `decideTests` in package limma for a detailed description on these two methods. When `separated` is used a list with all the genes that have been analized in limma is given. The list includes de following columns:

PROBE - Probe name (one of the probes interrogating the gene) GENE - miRNA name PROBE chr\_coord - Agilent chromosomal location M - Fold change A - Mean of the intensity for that miRNA t - moderated t-statistic pval - p value of the t-statistic adj.pval - p value adjusted by 'MTest-method' fdr.pval - p value adjusted by fdr

Some times, the user can be set `MTestmethod = none`, in this case, it might be interesting to still see the fdr value, despite of the fact that the user has decided not apply any multiple testing correction.

If the `nestedF` is used, then two lists are provided for each contrasts. A first containing the selected significant genes, and a second list containing the rest of the genes that have been analyzed. The columns given in this case is:

PROBE - Probe name (one of the probes interrogating the gene) GENE - miRNA name PROBE chr\_coord - Agilent chromosomal location M - Fold change A - Mean of the intensity for that miRNA t - moderated t-statistic t pval - p value of the t-statistic F - F statistic (null hypothesis: Ci = Cj, for all contrasts i, j) adj.F.pval - F p value adjusted by 'MTestmethod' fdr.F.pval - F p value adjusted by fdr

The html files, both for the `separated` and `nestedF` method, includes only the selected as significant genes.

    Mcut=0, 
    verbose=TRUE)

summary.uRNAList

Summary of Microarray Data Objects

Description

Briefly summarize microarray data objects.

Usage

## S3 method for class 'uRNAList'
summary(object, ...)

Arguments

object an object of class uRNAList
...
other arguments are not used

Details

The data objects are summarized as if they were lists, i.e., brief information about the length and type of the components is given. This function and this file, has been borrowed from the files created by Gordon Smyth for the limma package.
Value
A table.

Author(s)
Pedro Lopez-Romero

---

Example of target file

#### Format

- **FileName** names of the Files Ast.txt Bst.txt Aunst.txt Bunst.txt
- **Treatment** Assigns level for Treatment Effect to each File (mandatory)
- **GErep** a numeric vector that numerates the FACTOR of the Treatment Effect (mandatory)
- **Subject** Assigns level for Subject Effect to each File

#### Details

It is a tab-delimited text format file. The target file is created by the user with the intention of carrying out a differential expression analysis in future steps using `limma`. Here is where the factors that are going to be included in the linear model that is fitted to each gen are specified. The targets file assigns each data file to a particular experimental conditions. First column `FileName` is mandatory and includes the image data files names. Second column `Treatment` is also mandatory and includes the image data files names. Second column `Treatment` is also mandatory and includes the treatment effect. Third column `GErep` is also mandatory, and includes the treatment effect in a numeric code, from 1 to n, being n the number of Treatment effect levels.

#### References

**Description**

The function creates an uRNAList containing the TotalGeneSignal computed by the Agilent Feature Extraction software. This signal can be used for the statistical analysis after a possible normalization step.

**Usage**

tgsMicroRna(dd, offset, half, makePLOT=FALSE, verbose=FALSE)

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dd</td>
<td>uRNAList, containing the output from readMicroRnaAFE</td>
</tr>
<tr>
<td>offset</td>
<td>integer. To use this option set half = FALSE</td>
</tr>
<tr>
<td>half</td>
<td>logical, if TRUE half option is used</td>
</tr>
<tr>
<td>makePLOT</td>
<td>logical, if TRUE QC plots with the Total Gene Signal are displayed</td>
</tr>
<tr>
<td>verbose</td>
<td>logical, if TRUE prints out some summary results</td>
</tr>
</tbody>
</table>

**Details**

The function creates a uRNAList object that contains in the uRNAList$TGS, uRNAList$TPS, uRNAList$meanS & uRNAList$procS the Total Gene Signal (TGS) as computed by the Agilent Feature Extraction algorithms. This TGS is not in log2 scale. All the replicated genes have the same estimated TGS, and the function simply picks one gene from each set of replicated genes. To maintain the format of the uRNAList, every selected gene retains a probe name attach to them. This probe name is not meaningful any more, since the signal corresponds to the total gene signal and not to the probe signal. The TGS processed by AFE contains some negative values. To get signals with positive values we can either add a positive small constant to all the signals (offset) or we can select the ‘half’ option, which set to 0.5 all the values that are smaller than 0.5. To use the offset option we have to set half=FALSE, otherwise the half method is used by default. The offset option, adds to each signal the quantity (abs( min(ddTGS$TGS)) + offset), where ddTGS$TGS is the matrix that contains the TotalGeneSignal.

**Value**

uRNAList containing the TotalGeneSignal computed by the Agilent Feature Extraction software. Optionally, it can generate a boxplot, a density plot and a MA plot with the Total Gene Signal.

**References**

tgsNormalization

**Examples**

```r
data(dd.micro)
data(targets.micro)
ddTGS=tgsMicroRna(dd.micro,half=TRUE,makePLOT=FALSE,verbose=FALSE)
```

---

**tgsNormalization**

*Normalization Between Arrays*

**Description**

Normalization between arrays of the Total Gene Signal. The function is a wrapper of the 'limma' 'normalizeBetweenArrays' with ('none','quantile','scale') methods.

**Usage**

```r
tgsNormalization(ddTGS, NORMmethod = "quantile", makePLOTpre = FALSE, makePLOTpost = FALSE, targets,verbose=FALSE)
```

**Arguments**

- `ddTGS`: uRNAList, containing the output from tgsMicroRna
- `NORMmethod`: character specifying the normalization method, 'none','quantile','scale'. The default is quantile
- `makePLOTpre`: logical, if TRUE QC plots with the Raw Total Gene Signal are displayed
- `makePLOTpost`: logical, if TRUE QC plots with the Normalized Total Gene Signal are displayed
- `targets`: data.frame with the target structure
- `verbose`: logical, if TRUE prints out output

**Value**

A uRNAList object containing the Normalized Total Gene Signal in log 2 scale

Examples

```r
## Not run:
data(dd.micro)
data(targets.micro)
ddTGS=tgsMicroRna(dd.micro,half=TRUE,makePLOT=FALSE,verbose=FALSE)
ddNORM=tgsNormalization(ddTGS,'quantile',
makePLOTpre=FALSE,makePLOTpost=TRUE,targets.micro,verbose=TRUE)
graphics.off()
## End(Not run)
```

### uRNAList-class

#### Description

A list-based class (similar to the RGList class in limma package) for the storing of Agilent chips microRNA data. uRNAList objects are created by `read.agiMicroRna`

#### uRNAList Components

uRNAList objects are created by `new("uRNAList",Newagi)` where `Newagi` is a list with the following components:

- **uRNAList$TGS**: matrix, 'gTotalGeneSignal'
- **uRNAList$TPS**: matrix, 'gTotalProbeSignal'
- **uRNAList$meanS**: matrix, 'gMeanSignal'
- **uRNAList$procS**: matrix, 'gProcessedSignal'
- **uRNAList$targets**: data.frame, 'FileName'
- **uRNAList$genes**:
  - **ProbeName**: vector of characters, 'AGilent Probe Name'
  - **GeneName**: vector of characters, 'microRNA Name'
  - **ControlType**: vector of integers, '0' = Feature, '1' = Positive control, '-1' = Negative control
- **uRNAList$other**:
  - **gIsGeneDetected**: matrix, FLAG to classify signal if 'IsGeneDetected=1' or 'not=0'
  - **gIsSaturated**: matrix, FLAG to classify signal if 'IsSaturated = 1' or 'not=0'
  - **gIsFeatPopnOL**: matrix, FLAG to classify signal if 'gIsFeatPopnOL = 0' or 'not=1'
  - **gIsFeatNonUnifOL**: matrix, FLAG to classify signal if 'gIsFeatNonUnifOL = 0' or 'not=1'
  - **gBGMedianSignal**: matrix, `gBGMedianSignal`
  - **gBGUsed**: matrix, `gBGUsed`

writeEset

## Not run:
data(dd.micro)

## End(Not run)

writeEset  Writes the expression data matrix of an ExpressionSet object in a txt file

Description

Writes the expression data matrix of an ExpressionSet object in a file.

Usage

writeEset(eset, ddPROC, targets, verbose=FALSE)

Arguments

eset  An Expression object, normally containing the processed data
ddPROC  An RGList object, normally containing the processed data
targets  data.frame with the targets structure
verbose  logical, if TRUE prints out output

Details

Writes the expression data matrix of an ExpressionSet object in a file.

Author(s)

Pedro Lopez-Romero

See Also

An ’RGList’ example containing processed data is in ddPROC and an overview of how the processed data is produced is given in filterMicroRna. The ExpressionSet object can be generated using esetMicroRna

Examples

## Not run:
data(ddPROC)
data(targets.micro)
esetPROC=esetMicroRna(ddPROC,targets.micro,makePLOT=TRUE,verbose=FALSE)
writeEset(esetPROC,ddPROC,targets.micro,verbose=TRUE)

## End(Not run)
