Package ‘BioMVCClass’
April 25, 2017

Title  Model-View-Controller (MVC) Classes That Use Biobase
Version 1.44.0
Author Elizabeth Whalen
Description Creates classes used in model-view-controller (MVC) design
Depends R (>= 2.1.0), methods, MVCClass, Biobase, graph, Rgraphviz
Maintainer Elizabeth Whalen <ewhalen@hsph.harvard.edu>
License LGPL
biocViews Visualization, Infrastructure, GraphAndNetwork
NeedsCompilation no

exprModel-class  Class "exprModel": A class to represent an ExpressionSet model

Description
exprModel is a class to represent an ExpressionSet model. This class inherits from the virtual class, gModel. An object of exprModel is responsible for storing and updating the data.

Objects from the Class
Objects can be created by calls of the form new("exprModel", ...). The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNNetwork package).
graphModel-class

Slots

modelData: the model data, which is an ExpressionSet
linkData: a list of functions that link this model to its parent and child models (if it has any)
virtualData: the data that is needed by the views of this object
modelName: the name of this model
modelVar: a list of variables that refer to the modelData (for instance this may be t-test values that were calculated from the modelData)

Extends

Class "gModel", directly.

Methods

No methods defined with class "exprModel" in the signature. The methods for this class will be created in other packages that use this package like iSNNetwork.

graphModel-class

graphModel-class Class "graphModel": A class to represent a graph model

Description

graphModel is a class to represent a graph model. This class inherits from the virtual class, gModel. An object of graphModel is responsible for storing and updating the data.

Objects from the Class

Objects can be created by calls of the form new("graphModel", ...). The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNNetwork package).

Slots

modelData: the model data, which is a graph object
linkData: a list of functions that link this model to its parent and child models (if it has any)
virtualData: data that is needed by views of this model
modelName: the name of this model
modelVar: a list of variables that refer to the modelData (for instance this may be t-test values that were calculated from the modelData)
**graphView-class**

**Extends**

Class "gModel", directly.

**Methods**

No methods defined with class "graphModel" in the signature. The methods for this class will be created in other packages that use this package like iSNetwork.

graphView-class

---

**Class "graphView": A class to represent a graph view**

**Description**

graphView is a class to represent a view that is a graph. graphView inherits from the class, plotView, which inherits from the virtual class, genView.

**Objects from the Class**

Objects can be created by calls of the form `new("graphView", ...)`. The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNetwork package).

**Slots**

- `plotDevice`: the plot device number
- `plotPar`: the parameter list for the plot, see `par()`
- `drArea`: an object of class "GtkDrawingArea"
- `dataName`: a character string describing what data are shown in the view
- `win`: an object of class "GtkWindow" that holds the view
- `winNum`: a number that tells what number view this is (for example, the first view created will have `winNum=1`)
- `grLayout`: the Ragraph object, which represents the layout for the graph plot

**Extends**

Class "plotView", directly. Class "genView", by class "plotView".

**Methods**

No methods defined with class "graphView" in the signature.

GSE-class

Class "GSE": A class to represent gene set enrichment data

Description

GSE is a class to represent gene set enrichment data and will be used in the modelData slot in the gseModel object. This class will store all of the information that pertains to performing gene set enrichment.

Objects from the Class

Objects can be created by calls of the form new("GSE", ...).

Slots

incidMat: the incidence matrix that shows the relationship between the genes and the gene sets
gTestStat: the test statistic for the genes relationship with the phenotype
gsTestStat: the test statistic for the gene set
expData: the experimental data (here it will be of class ExpressionSet)
descr: a description of the gene set being studied

Methods

incidMat<- Sets the incidMat slot
incidMat  Returns the incidMat slot
gTestStat<- Sets the gTestStat slot
gTestStat  Returns the gTestStat slot
gsTestStat<- Sets the gsTestStat slot
gsTestStat  Returns the gsTestStat slot
expData<- Sets the expData slot
expData  Returns the expData slot
descr<- Sets the descr slot
descr  Returns the descr slot

gseModel-class
Class "gseModel": A class to represent a GSE model

Description

gseModel is a class to represent a gene set enrichment (GSE) model. This class inherits from the virtual class, gModel.

Objects from the Class

Objects can be created by calls of the form `new("gseModel", ...)`. The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNetwork package).

Slots

- `modelData`: the model data, which is an object of GSE
- `linkData`: a list of functions that link this model to its parent and child models (if it has any)
- `virtualData`: the data that is needed by the views of this object
- `modelName`: the name of this model
- `modelVar`: a list of variables that refer to the modelData (for instance this may be t-test values that were calculated from the modelData)

Extends

Class "gModel", directly.

Methods

No methods defined with class "gseModel" in the signature. The methods for this class will be created in other packages that use this package like iSNetwork.

GSE-class, graphModel-class, exprModel-class
heatmapView-class

**Class "heatmapView": A class to represent a heatmap view**

**Description**

heatmapView is a class to represent a view that is a heatmap. heatmapView inherits from the class, plotView, which inherits from the virtual class, genView.

**Objects from the Class**

Objects can be created by calls of the form `new("heatmapView", ...)`. The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNetwork package).

**Slots**

- `ordering`: a list of of information returned from the heatmap function
- `plotDevice`: the plot device number
- `plotPar`: the parameter list for the plot, see `par()`
- `drArea`: an object of class "GtkDrawingArea"
- `dataName`: a character string describing what data are shown in the view
- `win`: an object of class "GtkWindow" that holds the view
- `winNum`: a number that tells what number view this is (for example, the first view created will have `winNum=1`)
- `rNames`: the names of the rows to be included in the heatmap (this allows the original data to be subset in the view)

**Extends**

Class "plotView", directly. Class "genView", by class "plotView".

**Methods**

- `ordering<-`: Sets the `ordering` slot
- `ordering`: Returns the `ordering` slot
- `rNames<-`: Sets the `rNames` slot
- `rNames`: Returns the `rNames` slot
