Package ‘BufferedMatrix’

January 14, 2017

Version 1.38.0
Title A matrix data storage object held in temporary files
Author Benjamin Milo Bolstad <bmb@bmbolstad.com>
Maintainer Benjamin Milo Bolstad <bmb@bmbolstad.com>
Depends R (>= 2.6.0), methods
Description A tabular style data object where most data is stored outside main memory. A buffer is used to speed up access to data.
License LGPL (>= 2)

LazyLoad yes
biocViews Infrastructure
NeedsCompilation yes

R topics documented:

as.BufferedMatrix .......................... 1
BufferedMatrix-class ........................ 2
createBufferedMatrix ....................... 5

Index

as.BufferedMatrix  Check or Coerce object to BufferedMatrix

Description

‘as.BufferedMatrix’ will coerce the supplied object into a BufferedMatrix. ‘is.BufferedMatrix’ checks whether the supplied argument is a BufferedMatrix.

Usage

as.BufferedMatrix(x, bufferrows=1, buffercols=1, directory=getwd())
is BufferedMatrix(x)
BufferedMatrix-class

Arguments

x
an R object

bufferrows
number of rows to be buffered if the row buffer is activated

buffercols
number of columns to be buffered

directory
path to directory where temporary files should be stored

Details

These functions are useful for converting between R matrix objects and BufferedMatrix objects.

BufferedMatrix-class  Class BufferedMatrix

Description

This is a class representation of a buffered matrix (of numeric data). In this case data is primarily stored outside main memory in temporary files.

Objects from the Class

Objects can be created using the function createBufferedMatrix

Slots

rawBufferedMatrix: a pointer to an external structure used to access and store the matrix data.
rownames: rownames for the matrix.
colnames: colnames for the matrix.

Methods

ncol signature(object = "BufferedMatrix"): Returns the number of columns in the matrix

nrow signature(object = "BufferedMatrix"): Returns the number of rows in the matrix

dim signature(object = "BufferedMatrix"): Returns the dimensions of the matrix

buffer.dim signature(object = "BufferedMatrix"): Returns the number of columns and the number of rows to be stored in the buffer

set.buffer.dim signature(object = "BufferedMatrix"): Set the buffer size or resize it

[ signature(object = "BufferedMatrix"): matrix accessor

[<‐ signature(object = "BufferedMatrix"): matrix replacer

show signature(object = "BufferedMatrix"): prints basic information about the BufferedMatrix out to screen

is.RowMode signature(object = "BufferedMatrix"): returns TRUE if the row buffer is active and FALSE otherwise.
**is.ColMode** signature(object = "BufferedMatrix"): returns TRUE if the row buffer is inactive and FALSE otherwise.

**RowMode** signature(object = "BufferedMatrix"): Activate the row buffer.

**ColMode** signature(object = "BufferedMatrix"): Deactivate the row buffer

**duplicate** signature(object = "BufferedMatrix"): Make a copy of the BufferedMatrix

**prefix** signature(object = "BufferedMatrix"): return the initial part of the string used for temporary files

**directory** signature(object = "BufferedMatrix"): return the location where temporary files are stored

**filenames** signature(object = "BufferedMatrix"): return the fully pathed filenames for each column in the matrix

**ewApply** signature(object = "BufferedMatrix"): apply a function elementwise

**exp** signature(object = "BufferedMatrix"): Compute the exponential elementwise of the matrix

**sqrt** signature(object = "BufferedMatrix"): Compute the square-root elementwise of the matrix

**pow** signature(object = "BufferedMatrix"): Compute $x^\text{power}$ elementwise of the matrix

**log** signature(object = "BufferedMatrix"): Compute logarithm elementwise of the matrix

**colMax** signature(object = "BufferedMatrix"): Returns a vector containing maximums by column

**rowMax** signature(object = "BufferedMatrix"): Returns a vector containing maximums by row

**colMeans** signature(object = "BufferedMatrix"): Returns a vector containing means by column

**rowMeans** signature(object = "BufferedMatrix"): Returns a vector containing means by row

**colMin** signature(object = "BufferedMatrix"): Returns a vector containing minimums by column

**rowMin** signature(object = "BufferedMatrix"): Returns a vector containing minimums by row

**colVars** signature(object = "BufferedMatrix"): Returns a vector containing sample variances by column

**rowVars** signature(object = "BufferedMatrix"): Returns a vector containing sample variances by row

**colSd** signature(object = "BufferedMatrix"): Returns a vector containing sample standard deviations by column

**rowSd** signature(object = "BufferedMatrix"): Returns a vector containing sample standard deviations by row

**colSums** signature(object = "BufferedMatrix"): Returns a vector containing sum by column

**rowSums** signature(object = "BufferedMatrix"): Returns a vector containing sum by row

**colMedians** signature(object = "BufferedMatrix"): Returns a vector containing medians by column

**rowMedians** signature(object = "BufferedMatrix"): Returns a vector containing medians by row. Best only used when the matrix is in RowMode (otherwise it is extremely slow)
**Max** signature(object = "BufferedMatrix"): Returns the maximum of all elements in the matrix

**Min** signature(object = "BufferedMatrix"): Returns the minimum of all elements in the matrix

**Var** signature(object = "BufferedMatrix"): Returns the sample variance of all elements in the matrix

**Sd** signature(object = "BufferedMatrix"): Returns the sample standard deviations of all elements in the matrix

**Sum** signature(object = "BufferedMatrix"): Returns the sum of all elements in the matrix

**mean** signature(object = "BufferedMatrix"): Returns the mean of all elements in the matrix

**colApply** signature(object = "BufferedMatrix"): apply a function columnwise. Returns either a vector or BufferedMatrix.

**rowApply** signature(object = "BufferedMatrix"): apply a function row-wise. Returns either a vector or BufferedMatrix.

**as.matrix** signature(object = "BufferedMatrix"): coerce BufferedMatrix into a regular R matrix

**subBufferedMatrix** signature(object = "BufferedMatrix"): gets data from BufferedMatrix and returns it in another BufferedMatrix

**rownames** signature(object = "BufferedMatrix"): access the row names

**colnames** signature(object = "BufferedMatrix"): access the column names

**rownames<-** signature(object = "BufferedMatrix"): replace the row names

**colnames<-** signature(object = "BufferedMatrix"): replace the column names

**dimnames** signature(object = "BufferedMatrix"): Access the row and column names

**dimnames** signature(object = "BufferedMatrix"): Replace the row and column names

**ReadOnlyMode** signature(object = "BufferedMatrix"): Toggles the Read Only mode on and off

**is.ReadOnlyMode** signature(object = "BufferedMatrix"): Finds out if it is in Read Only Mode

**memory.usage** signature(object = "BufferedMatrix"): Give amount of RAM currently in use by BufferedMatrix object

**disk.usage** signature(object = "BufferedMatrix"): Give amount of disk space currently in use by BufferedMatrix object

**as(matrix,BufferedMatrix)**: Coerce matrix to BufferedMatrix.

**as(BufferedMatrix,matrix)**: Coerce the Buffered to matrix.

AddColumn: Add an additional column to the matrix. Will be all empty (set to 0)

MoveStorageDirectory: Move the temporary files used to store the matrix from one location to another

createBufferedMatrix

Description

Creates a Buffered Matrix object

Usage

createBufferedMatrix(rows, cols=0, bufferrows=1, buffercols=1, prefix="BM", directory=getwd())

Arguments

rows     Number of rows in the matrix
cols     Initial number of columns in the matrix
bufferrows  number of rows to be buffered if the row buffer is activated
buffercols number of columns to be buffered
prefix   String to be used as start of name for any temporary files
directory path to directory where temporary files should be stored
