Package ‘CNORode’

March 28, 2017

Type Package
Title ODE add-on to CellNOptR
Version 1.16.0
Date 2014-01-10
Author David Henriques, Thomas Cokelaer
Maintainer David Henriques <davidpcnet@hotmail.com>
biocViews CellBasedAssays, CellBiology, Proteomics, Bioinformatics, TimeCourse
Description ODE add-on to CellNOptR
License GPL-2
LazyLoad yes
Depends CellNOptR (>= 1.5.14), genalg
Enhances MEIGOR
NeedsCompilation yes

createLBodeContPars Create a list with ODE parameter information needed to perform parameter estimation

Description

Creates a list with the continuous parameters to simulate the model, upper and lower bounds for the parameter estimation, parameters names, indices of the parameters and other information.

Usage

createLBodeContPars(model, LB_n = 1, LB_k = 0.1, LB_tau = 0.01,
UB_n = 5, UB_k = 0.9, UB_tau = 10, default_n = 3, default_k = 0.5,
default_tau = 1, LB_in = c(), UB_in = c(), opt_n = TRUE, opt_k = TRUE,
opt_tau = TRUE, random = FALSE)

Arguments

model The logic model to be simulated.
LB_n A numeric value to be used as lower bound for all parameters of type n.
LB_k A numeric value to be used as lower bound for all parameters of type k.
LB_tau A numeric value to be used as lower bound for all parameters of type tau.
UB_n A numeric value to be used as upper bound for all parameters of type n.
UB_k A numeric value to be used as upper bound for all parameters of type k.
UB_tau A numeric value to be used as upper bound for all parameters of type tau.
default_n The default parameter to be used for every parameter of type n.
default_k The default parameter to be used for every parameter of type k.
default_tau The default parameter to be used for every parameter of type tau.
LB_in An array with the the same length as ode_parameters$parValues with lower bounds for each specific parameter.
UB_in An array with the the same length as ode_parameters$parValues with upper bounds for each specific parameter.
opt_n Add all parameter n to the index of parameters to be fitted.
opt_k Add all parameter k to the index of parameters to be fitted.
opt_tau Add all parameter tau to the index of parameters to be fitted.
random logical value that determines that a random solution is for the parameters to be optimized.
defaultParametersGA

Value

parNames  An array containing the names of the parameters.
parValues  An array containing the values of the parameters, in the same order as the names.
index_opt_pars  An array containing the indexes for the parameters to be fitted.
index_n  An array containing the indexes of the parameters of type n.
index_k  An array containing the indexes of the parameters of type k.
index_tau  An array containing the indexes of the parameters of type tau.
LB  An array containing the lower bound for each parameter.
UB  An array containing the upper bound for each parameter.

Examples

library(CNORode)
data("ToyCNOlist",package="CNORode");
data("ToyModel",package="CNORode");
data("ToyIndices",package="CNORode");
ode_parameters=createLBodeContPars(model, opt_n=FALSE,default_n=2,
random=TRUE, LB_k=0.25, UB_k=0.8, LB_tau=0.01, UB_tau=10);

defaultParametersGA  Create default options to perform parameter estimation with a genetic algorithm.

Description

This function returns a list with several arguments for performing parameter estimation with the genetic algorithm from the package genalg.

Usage

defaultParametersGA()

Value

mutationChance  NA
popSize  200
iters  100
elitism  NA
time  1
monitor  TRUE
verbose  0
transfer_function  3
**defaultParametersSSm**

reltol 1e-04  
atol 0.001  
maxStepSize Inf  
maxNumSteps 1e+05  
maxErrTestsFails 50  
nan_fac = 1 0

**defaultParametersSSm**  
Create default options to perform parameter estimation with scatter search meta-heuristic.  

**Description**  
This function returns a list with several arguments for performing parameter estimation with scatter search meta-heuristic algorithm from the package essR.  

**Usage**  
defaultParametersSSm()  

**Value**  
maxeval Inf  
maxtime 100  
ndiverse NULL  
dim_refset NULL  
local_solver NULL  
verbose 0  
transfer_function 3  
reltol 1e-04  
atol 0.001  
maxStepSize Inf  
maxNumSteps 1e+05  
maxErrTestsFails 50  
nan_fac 1

getLBodeContObjFunction

Returns the objective function to perform parameter estimation.

Description
This function configures returns the objective function that can be used to evaluate the fitness of a logic based ODE model using a particular set of parameters. This function can be particularly useful if you are planning to couple a nonlinear optimization solver. The returned value of the objective function corresponds to the mean squared value normalized by the number of data points.

Usage
getLBodeContObjFunction(cnolist, model, ode_parameters, indices=NULL, time = 1, verbose = 0, transfer_function = 3, reltol = 1e-04, atol = 0.001, maxStepSize = Inf, maxNumSteps = 1e+05, maxErrTestsFails = 50, nan_fac = 1, useVariances = F, initial_state=0.1)

Arguments
- cnolist: A list containing the experimental design and data.
- model: The logic model to be simulated.
- ode_parameters: A list with the ODEs parameter information. Obtained with createLBodeContPars.
- indices: Indices to map data in the model. Obtained with indexFinder function from CellNOptR.
- time: An integer with the index of the time point to start the simulation. Default is 1.
- verbose: A logical value that triggers a set of comments.
- transfer_function: The type of used transfer. Use 1 for no transfer function, 2 for Hill function and 3 for normalized Hill function.
- reltol: Relative Tolerance for numerical integration.
- atol: Absolute tolerance for numerical integration.
- maxStepSize: The maximum step size allowed to ODE solver.
- maxNumSteps: The maximum number of internal steps between two points being sampled before the solver fails.
- maxErrTestsFails: Specifies the maximum number of error test failures permitted in attempting one step.
- nan_fac: A penalty for each data point the model is not able to simulate. We recommend higher than 0 and smaller that 1.
- useVariances: if True, use the variance in the fitness
- initial_state: initial state of the dynamic nodes (non-measured) (Defaults to 0.1)
getLBodeDataSim

Details

Check CellNOptR for details about the cnolist and the model format. For more details in the configuration of the ODE solver check the CVODES manual.

Value

Returns a function to evaluate the model fitness. This function receives a vector containing both continuous parameters and integer values representing which reactions should be kept in the model.

CellNOptR createLBodeContPars

Examples

library(CNORode)
data("ToyCNList",package="CNORode");
data("ToyModel",package="CNORode");
data("ToyIndices",package="CNORode");

ode_parameters=createLBodeContPars(model,random=TRUE);
minlp_obj_function=getLBodeContObjFunction(cnolistCNORodeExample, model,ode_parameters,indices);

x=ode_parameters$parValues;
f=minlp_obj_function(x);

getLBodeDataSim

Simulate value signals a CNO list With Logic-Based ODEs.

Description

This function receives a set of inputs, namely the cnolist and the model and returns a list with the same size of the cnolist$valueSignals.

Usage

getLBodeDataSim(cnolist, model, ode_parameters = NULL, indices = NULL, timeSignals=NULL, time = 1, verbose = 0, transfer_function = 3, reltol = 1e-04, atol = 0.001, maxStepSize = Inf, maxNumSteps = 1e+05, maxErrTestsFails = 50, initial_state=0.1)
getLBodeDataSim

Arguments

- `cnolist` A list containing the experimental design and data.
- `model` A list with the ODEs parameter information. Obtained with `createLBodeContPars`.
- `ode_parameters` A list with the ODEs parameter information. Obtained with `makeParameterList` function.
- `indices` Indices to map data in the model. Obtained with `indexFinder` function from `CellNOptR`.
- `timeSignals` An array containing a different `timeSignals`. If you use this argument, it will also modify the dimensions from `valueSignals`.
- `time` An integer with the index of the time point to start the simulation. Default is 1.
- `verbose` A logical value that triggers a set of comments.
- `transfer_function` The type of used transfer. Use 1 for no transfer function, 2 for Hill function and 3 for normalized Hill function.
- `reltol` Relative Tolerance for numerical integration.
- `atol` Absolute tolerance for numerical integration.
- `maxStepSize` The maximum step size allowed to ODE solver.
- `maxNumSteps` The maximum number of internal steps between two points being sampled before the solver fails.
- `maxErrTestsFails` Specifies the maximum number of error test failures permitted in attempting one step.
- `initial_state` initial state of the dynamic nodes (non-measured) (Defaults to 0.1)

Details

Check `CellNOptR` for details about the `cnolist` and the model format. For more details in the configuration of the ODE solver check the CVODES manual.

Value

Returns a list with simulated data that has the same structure as the `cnolist$valueSignals`. One matrix for each time-point.

Examples

```r
library(CNORode)
data("ToyCNOlist",package="CNORode");
data("ToyModel",package="CNORode");
data("ToyIndices",package="CNORode");
dataSimulation=getLBodeDataSim(cnolistCNORodeExample, model,indices=indices);
```
**getLBodeMINLPObjFunction**

*Get the objective function to evaluate the fitness of a given model structure and set of parameters.*

---

**Description**

This function configures returns the objective function that can be used to evaluate the fitness of a logic based ODE model using a particular set of parameters and model structure. This function can be particular useful if you are planning to couple a mixed integer nonlinear programming optimization solver. The returned value of the objective function corresponds to the mean squared value.

**Usage**

```r
getLBodeMINLPObjFunction(cnolist, model, ode_parameters, indices=NULL, time = 1, verbose = 0, transfer_function = 3, reltol = 1e-04, atol = 0.001, maxStepSize = Inf, maxNumSteps = 1e+05, maxErrTestsFails = 50, nan_fac = 1)
```

**Arguments**

- `cnolist`: A list containing the experimental design and data.
- `model`: The logic model to be simulated.
- `ode_parameters`: A list with the ODEs parameter information. Obtained with `createLBodeContPars`.
- `indices`: Indices to map data in the model. Obtained with `indexFinder` function from `CellNOptR`.
- `time`: An integer with the index of the time point to start the simulation. Default is 1.
- `verbose`: A logical value that triggers a set of comments.
- `transfer_function`: The type of used transfer. Use 1 for no transfer function, 2 for Hill function and 3 for normalized Hill function.
- `reltol`: Relative Tolerance for numerical integration.
- `atol`: Absolute tolerance for numerical integration.
- `maxStepSize`: The maximum step size allowed to ODE solver.
- `maxNumSteps`: The maximum number of internal steps between two points being sampled before the solver fails.
- `maxErrTestsFails`: Specifies the maximum number of error test failures permitted in attempting one step.
- `nan_fac`: A penalty for each data point the model is not able to simulate. We recommend higher than 0 and smaller that 1.

**Details**

Check `CellNOptR` for details about the cnolist and the model format. For more details in the configuration of the ODE solver check the CVODES manual.
getLBodeModelSim

Value

Returns a function to evaluate the model fitness. This function receives a continuous parameter vector.

f=minlp_obj_function(x);

getLBodeModelSim Simulate the logic-based ODE model

Description

This function simulates a logic-based ODE model and return a list with one matrix for each time point. The input species in the model are filled with NA values. If the simulation of a particular set of initial conditions fails the solver will fill the experience row with NA values.

Usage

getLBodeModelSim(cnolist, model, ode_parameters = NULL, indices = NULL, timeSignals=NULL, time = 1,verbose = 0, transfer_function = 3, reltol = 1e-04, atol = 0.001, maxStepSize = Inf, maxNumSteps = 1e+05, maxErrTestsFails = 50)

Arguments

cnolist A list containing the experimental design and data.
model The logic model to be simulated.
ode_parameters A list with the ODEs parameter information. Obtained with createLBodeContPars.
indices Indices to map data in the model. Obtained with indexFinder function from CellNOptR.
`getLBodeModelSim`  

- **timeSignals**: An array containing a different timeSignals. If you use this argument, it will also modify the dimensions from `valueSignals`.
- **time**: An integer with the index of the time point to start the simulation. Default is 1.
- **verbose**: A logical value that triggers a set of comments.
- **transfer_function**: The type of used transfer. Use 1 for no transfer function, 2 for Hill function and 3 for normalized Hill function.
- **reltol**: Relative Tolerance for numerical integration.
- **atol**: Absolute tolerance for numerical integration.
- **maxStepSize**: The maximum number of internal steps between two points being sampled before the solver fails.
- **maxNumSteps**: The maximum number of internal steps between two points being sampled before the solver fails.
- **maxErrTestsFails**: Specifies the maximum number of error test failures permitted in attempting one step.

**Details**

Check `CellNOptR` for details about the cnolist and the model format. For more details in the configuration of the ODE solver check the CVODES manual.

**Value**

Returns a list with simulated data with similar structure to `cnolist$valueSignals`. Contains one matrix for each time-point. Each matrix contains one row per experiment and one columns per model species.

**Author(s)**

David Henriques, Thomas Cokelaer

**Examples**

```r
library(CNORode)
data('ToyCNolist', package='CNORode');
data('ToyModel', package='CNORode');
data('ToyIndices', package='CNORode');
modelSimulation=getLBodeModelSim(cnolistCNORodeExample, model, indices=indices);
```
getLBodeSimFunction

Get a function to simulate a logic based ODE model.

Description

This function is internally used by CNORode to configure the simulation function with default arguments.

Usage

getLBodeSimFunction(cnolist1, model1, adjMatrix1, indices1, odeParameters1, time1 = 1, verbose1 = 0, transfer_function1 = 3, reltol1 = 1e-04, atol1 = 0.001, maxStepSize1 = Inf, maxNumSteps1 = 1e+05, maxErrTestsFails1 = 50, initial_state1=0.1)

Arguments

- **cnolist1**: A list containing the experimental design and data.
- **model1**: The logic model to be simulated.
- **adjMatrix1**: An adjacency matrix from the model.
- **indices1**: Indices to map data in the model. Obtained with indexFinder function from CellNOptR.
- **odeParameters1**: A list with the ODEs parameter information. Obtained with createLBodeContPars.
- **time1**: An integer with the index of the time point to start the simulation. Default is 1.
- **verbose1**: A logical value that triggers a set of comments.
- **transfer_function1**: The type of used transfer. Use 1 for no transfer function, 2 for Hill function and 3 for normalized Hill function.
- **reitol1**: Relative Tolerance for numerical integration.
- **atol1**: Absolute tolerance for numerical integration.
- **maxStepSize1**: The maximum step size allowed to ODE solver.
- **maxNumSteps1**: The maximum number of internal steps between two points being sampled before the solver fails.
- **maxErrTestsFails1**: Specifies the maximum number of error test failures permitted in attempting one step.
- **initial_state1**: initial state of the dynamic nodes (non-measured) (Defaults to 0.1)

Value

A function that returns a simulated model.

Note

This function is for CNORode internal use.

Author(s)

David Henriques, Thomas Cokelaer
getStates

See Also

CellNOptR CNORode

getStates

Find which species in the model are states.

Description

Receives an adjacency matrix (model$interMat from CellNOptR) and finds which species are states (i.e. not inputs).

Usage

getStates(adjacency)

Arguments

adjacency

An adjacency matrix from the model.

Value

A numeric vector with 0's for positions which are states and 1's for positions which are.

Note

For internal use of CNORode.

Author(s)

David Henriques, Thomas Cokelaer

See Also

incidence2Adjacency

incidence2Adjacency

Convert an incidence matrix into an adjacency matrix.

Description

Convert the incidence matrix (model representation of CellNOptR) into an adjacency matrix. Denotes the inputs/output relationships.

Usage

incidence2Adjacency(model)

Arguments

model

Model from CellNOptR.
**minlpLBodeSSm**

**Value**

Directed Adjacency matrix of size `n_species` by `n_species`.

**Note**

For internal use of CNORode.

**Author(s)**

David Henriques, Thomas Cokelaer

**See Also**

CellNOptR

---

**indices**

*Indices that relate cnolist to model*

**Description**

A list with indices that relate the cnolist with the model from CellNOptR

---

**minlpLBodeSSm**

*Search for the best combination of continuous parameters and logic gates.*

**Description**

This function uses essR to search for the best set of continuous parameters and model structure. The objective function is the same as the one provided by `getLBodeMINLPObjFunction`.

**Usage**

```r
minlpLBodeSSm(cnolist, model, ode_parameters = NULL, int_x0=NULL, indices = NULL, maxeval = Inf, maxtime = 100, ndiverse = NULL, dim_refset = NULL, local_solver = NULL, time = 1, verbose = 0, transfer_function = 3, reltol = 1e-04, atol = 0.001, maxStepSize = Inf, maxNumSteps = 1e+05, maxErrTestsFails = 50, nan_fac = 1)
```

**Arguments**

- `cnolist`: A list containing the experimental design and data.
- `model`: The logic model to be simulated.
- `ode_parameters`: A list with the ODEs parameter information. Obtained with `createLBodeContPars`.
- `int_x0`: Vector with initial solution for integer parameters.
- `indices`: Indices to map data in the model. Obtained with indexFinder function from CellNOptR.
- `maxeval`: Maximum number of evaluation in the optimization procedure.
- `maxtime`: Maximum number of evaluation spent in optimization procedure.
**Details**

Check CellNOptR for details about the cnolist and the model format. For more details in the configuration of the ODE solver check the CVODES manual.

**Value**

- **LB_n** A numeric value to be used as lower bound for all parameters of type n.
- **LB_k** A numeric value to be used as lower bound for all parameters of type k.
- **LB_tau** A numeric value to be used as lower bound for all parameters of type tau.
- **UB_n** A numeric value to be used as upper bound for all parameters of type n.
- **UB_k** A numeric value to be used as upper bound for all parameters of type k.
- **UB_tau** A numeric value to be used as upper bound for all parameters of type tau.
- **default_n** The default parameter to be used for every parameter of type n.
- **default_k** The default parameter to be used for every parameter of type k.
- **default_tau** The default parameter to be used for every parameter of type tau.
- **LB_in** An array with the same length as ode_parameters$parValues with lower bounds for each specific parameter.
- **UB_in** An array with the same length as ode_parameters$parValues with upper bounds for each specific parameter.
- **opt_n** Add all parameter n to the index of parameters to be fitted.
- **opt_k** Add all parameter k to the index of parameters to be fitted.
- **opt_tau** Add all parameter tau to the index of parameters to be fitted.
- **random** A logical value that determines that a random solution is for the parameters to be optimised.
- **model** The best fitting found model structure.
- **smm_results** A list containing the information provided by the nonlinear optimization solver.

```

model

A model from CellNoptR

Description

A model from CellNoptR to use with provided examples

parEstimationLBode

Perform parameter estimation using a genetic algorithm (package genalg) or ssm (if package essm available).

Description

This function is an alias to the parEstimationLBode variants (parEstimationLBodeGA and parEstimationLBodeSSm)

Usage

parEstimationLBode(cnolist, model, method="ga", ode_parameters = NULL, indices = NULL, paramsGA=NULL, paramsSSm=NULL)
Arguments

cnolist A list containing the experimental design and data.
model The logic model to be simulated.
method Only "ga" or "essm" arguments are accepted.
ode_parameters A list with the ODEs parameter information. Obtained with createLBodeContPars.
indices Indices to map data in the model. Obtained with indexFinder function from CellNOptR.
paramsGA A list of GA parameters. default is the list returned by defaultParametersGA.
paramsSSm A list of SSm parameters. default is the list returned by defaultParametersSSm.

Value

LB_n A numeric value to be used as lower bound for all parameters of type n.
LB_k A numeric value to be used as lower bound for all parameters of type k.
LB_tau A numeric value to be used as lower bound for all parameters of type tau.
UB_n A numeric value to be used as upper bound for all parameters of type n.
UB_k A numeric value to be used as upper bound for all parameters of type k.
UB_tau A numeric value to be used as upper bound for all parameters of type tau.
default_n The default parameter to be used for every parameter of type n.
default_k The default parameter to be used for every parameter of type k.
default_tau The default parameter to be used for every parameter of type tau.
LB_in An array with the the same length as ode_parameters$parValues with lower bounds for each specific parameter.
UB_in An array with the the same length as ode_parameters$parValues with upper bounds for each specific parameter.
opt_n Add all parameter n to the index of parameters to be fitted.
opt_k Add all parameter k to the index of parameters to be fitted.
opt_tau Add all parameter tau to the index of parameters to be fitted.
random A logical value that determines that a random solution is for the parameters to be optimized.
res A list containing the information provided by the solver.

CellNOptR createLBodeContPars rbga
parEstimationLBodeGA

Examples

```r
data("ToyCNOlist", package="CNORode");
data("ToyModel", package="CNORode");
data("ToyIndices", package="CNORode");

ode_parameters=createLBodeContPars(model, random=TRUE);
# Visualize initial solution
simulatedData=plotLBodeFitness(cnolistCNORodeExample, model, ode_parameters, indices=indices)
paramsGA = defaultParametersGA()
paramsGA$maxStepSize = 1
paramsGA$popSize = 10
paramsGA$iter = 10
paramsGA$transfer_function = 2

ode_parameters=parEstimationLBode(cnolistCNORodeExample,model,ode_parameters=ode_parameters,
paramsGA=paramsGA)
# Visualize fitted solution
simulatedData=plotLBodeFitness(cnolistCNORodeExample, model, ode_parameters, indices=indices)
```

Description

This function uses a genetic algorithm (package genalg) to perform parameter estimation. The objective function is the same as the one provided by `getLBodeContObjFunction`.

Usage

```r
parEstimationLBodeGA(cnolist, model, ode_parameters = NULL, indices = NULL, mutationChance = NA, popSize = 200, iters = 100,
elitism = NA, time = 1, monitor = TRUE, verbose = 0, transfer_function = 3, reltol = 1e-04,
atol = 0.001, maxStepSize = Inf, maxNumSteps = 1e+05, maxErrTestsFails = 50, nan_fac = 1, initial_state=0.1)
```

Arguments

- `cnolist` A list containing the experimental design and data.
- `model` The logic model to be simulated.
- `ode_parameters` A list with the ODEs parameter information. Obtained with `createLBodeContPars`.
- `indices` Indices to map data in the model. Obtained with indexFinder function from CellNOptR.
- `mutationChance` the chance that a gene in the chromosome mutates. By default 1/(size+1). It affects the convergence rate and the probing of search space: a low chance results in quicker convergence, while a high chance increases the span of the search space.
- `popSize` the population size.
- `iters` the number of iterations.
- `elitism` the number of chromosomes that are kept into the next generation. By default is about 20% of the population size.
time An integer with the index of the time point to start the simulation. Default is 1.
monitor If TRUE a plot will be generated to monitor the objective function
verbose A logical value that triggers a set of comments.
transfer_function The type of used transfer. Use 1 for no transfer function, 2 for Hill function and 3 for normalized Hill function.
reitol Relative Tolerance for numerical integration.
atol Absolute tolerance for numerical integration.
maxStepSize The maximum step size allowed to ODE solver.
maxNumSteps The maximum number of internal steps between two points being sampled before the solver fails.
maxErrTestsFails Specifies the maximum number of error test failures permitted in attempting one step.
nan_fac A penalty for each data point the model is not able to simulate. We recommend higher than 0 and smaller that 1.
initial_state initial state of the dynamic nodes (non-measured) (Defaults to 0.1)

Value

LB_n A numeric value to be used as lower bound for all parameters of type n.
LB_k A numeric value to be used as lower bound for all parameters of type k.
LB_tau A numeric value to be used as lower bound for all parameters of type tau.
UB_n A numeric value to be used as upper bound for all parameters of type n.
UB_k A numeric value to be used as upper bound for all parameters of type k.
UB_tau A numeric value to be used as upper bound for all parameters of type tau.
default_n The default parameter to be used for every parameter of type n.
default_k The default parameter to be used for every parameter of type k.
default_taul The default parameter to be used for every parameter of type tau.
LB_in An array with the the same length as ode_parameters$parValues with lower bounds for each specific parameter.
UB_in An array with the the same length as ode_parameters$parValues with upper bounds for each specific parameter.
opt_n Add all parameter n to the index of parameters to be fitted.
opt_k Add all parameter k to the index of parameters to be fitted.
opt_tau Add all parameter tau to the index of parameters to be fitted.
random A logical value that determines that a random solution is for the parameters to be optimized.
res A list containing the information provided by the nonlinear optimization solver (genalg).

parEstimationLBodeSSm  Perform parameter estimation using essR.

Description

This function uses essR to perform parameter estimation. The objective function is the same as the
one provided by getLBodeContObjFunction.

Usage

parEstimationLBodeSSm(cnolist, model, ode_parameters = NULL, indices = NULL,
maxeval = Inf, maxtime = 100, ndiverse = NULL, dim_refset = NULL, local_solver = NULL,
time = 1, verbose = 0, transfer_function = 3, reltol = 1e-04, atol = 0.001,
maxStepSize = Inf, maxNumSteps = 1e+05, maxErrTestsFails = 50, nan_fac =1,
useVariances=F,initial_state=0.1)

Arguments

cnolist  A list containing the experimental design and data.
model  The logic model to be simulated.
ode_parameters  A list with the ODEs parameter information. Obtained with createLBodeContPars.
indices  Indices to map data in the model. Obtained with indexFinder function from CellNOptR.
maxeval  Maximum number of evaluation in the optimization procedure.
maxtime  Duration of the optimization procedure.
ndiverse  Number of diverse initial solutions.
dim_refset  Size of the reference set.
local_solver  Local solver to be used in SSm.
time  An integer with the index of the time point to start the simulation. Default is 1.
verbose  A logical value that triggers a set of comments.
**parEstimationLBodeSSm**

**transfer_function**
The type of used transfer. Use 1 for no transfer function, 2 for Hill function and 3 for normalized Hill function.

**reltol**
Relative Tolerance for numerical integration.

**atol**
Absolute tolerance for numerical integration.

**maxStepSize**
The maximum step size allowed to ODE solver.

**maxNumSteps**
The maximum number of internal steps between two points being sampled before the solver fails.

**maxErrTestsFails**
Specifies the maximum number of error test failures permitted in attempting one step.

**nan_fac**
A penalty for each data point the model is not able to simulate. We recommend higher than 0 and smaller that 1.

**useVariances**
Uses variance if any

**initial_state**
initial state of the dynamic nodes (non-measured) (Defaults to 0.1)

**Details**

Check **CellNOpTR** for details about the cnolist and the model format. For more details in the configuration of the ODE solver check the CVODES manual.

**Value**

**LB_n**
A numeric value to be used as lower bound for all parameters of type n.

**LB_k**
A numeric value to be used as lower bound for all parameters of type k.

**LB_tau**
A numeric value to be used as lower bound for all parameters of type tau.

**UB_n**
A numeric value to be used as upper bound for all parameters of type n.

**UB_k**
A numeric value to be used as upper bound for all parameters of type k.

**UB_tau**
A numeric value to be used as upper bound for all parameters of type tau.

**default_n**
The default parameter to be used for every parameter of type n.

**default_k**
The default parameter to be used for every parameter of type k.

**default_tau**
The default parameter to be used for every parameter of type tau.

**LB_in**
An array with the the same length as ode_parameters$parValues with lower bounds for each specific parameter.

**UB_in**
An array with the the same length as ode_parameters$parValues with upper bounds for each specific parameter.

**opt_n**
Add all parameter n to the index of parameters to be fitted.

**opt_k**
Add all parameter k to the index of parameters to be fitted.

**opt_tau**
Add all parameter tau to the index of parameters to be fitted.

**random**
A logical value that determines that a random solution is for the parameters to be optimized.

**smm_results**
A list containing the information provided by the nonlinear optimization solver.

**Author(s)**

plotLBodeFitness

Plot data against simulated values.

Description

Plots the simulated values with the logic-based ODE against the data contained in the cnolist. The data values are represented with a black line and the simulated values with a blue line. Additionally, this function returns the simulated values.

Usage

```r
plotLBodeFitness(cnolist, model, ode_parameters = NULL, indices = NULL,
adjMatrix = NULL, time = 1, verbose = 0, transfer_function = 3, reltol = 1e-04,
atol = 0.001, maxStepSize = Inf, maxNumSteps = 1e+05, maxErrTestsFails = 50,
plot_index_signals = NULL, plot_index_experiments = NULL,
plot_index_cues = NULL, colormap="heat", plotParams=list(margin=0.1, width=15, height=12,
cmap_scale=1, cex=1.6, ymin=NULL), initial_state=0.1 )
```

Arguments

- `cnolist`: A list containing the experimental design and data.
- `model`: The logic model to be simulated.
- `ode_parameters`: A list with the ODEs parameter information. Obtained with `createLBodeContPars`.
- `indices`: Indices to map data in the model. Obtained with `indexFinder` function from `CellNOptR`.
- `adjMatrix`: Model representation in the form of an adjacency matrix. When not provided, will be automatically computed based on the model.
- `time`: An integer with the index of the time point to start the simulation. Default is 1.

`CellNOptR` `createLBodeContPars`

Examples

```r
## Not run:
data("ToyCNOlist",package="CNORode");
data("ToyModel",package="CNORode");
data("ToyIndices",package="CNORode");

ode_parameters=createLBodeContPars(model,random=TRUE);

#Visualize initial simulation
simulatedData=plotLBodeFitness(cnolistCNORodeExample, model,ode_parameters,indices=indices)

ode_parameters=parEstimationLBodeSSm(cnolistCNORodeExample,model,ode_parameters,
indices=indices,maxtime=20,ndiverse=50,dim_refset=6);

#Visualize fitted solution
simulatedData=plotLBodeFitness(cnolistCNORodeExample, model,indices=indices,ode_parameters=ode_parameters);

## End(Not run)
```
plotLBodeFitness

verbose
A logical value that triggers a set of comments.

transfer_function
The type of used transfer. Use 1 for no transfer function, 2 for Hill function and 3 for normalized Hill function.

reltol
Relative Tolerance for numerical integration.
atol
Absolute tolerance for numerical integration.
maxStepSize
The maximum step size allowed to ODE solver.
maxNumSteps
The maximum number of internal steps between two points being sampled before the solver fails.
maxErrTestsFails
Specifies the maximum number of error test failures permitted in attempting one step.

plot_index_signals
In case you only want to plot some signals, provide an integer vector with the indexes.

plot_index_experiments
In case you only want to plot some experiments, provide an integer vector with the indexes.

plot_index_cues
In case you only want to plot some cues, provide an integer vector with the indexes.

colormap
Uses the same colormap as in CellNOptR by default. If set to "green", it uses the deprecated colormap.

plotParams
additional parameters to refine the ploggin. See plotOptimResultsPan function in CellNOptR for more details.

initial_state
initial state of the dynamic nodes (non-measured) (Defaults to 0.1)

Details
Check CellNOptR for details about the cnolist and the model format. For more details in the configuration of the ODE solver check the CVODES manual.

Value
Returns a list with simulated data that has the same structure as the cnolist$valueSignals. One matrix for each time-point.

CellNOptR createLBodeContPars

Examples
library(CNORode)
data("ToyCNOlist", package="CNORode");
data("ToyModel", package="CNORode");
data("ToyIndices", package="CNORode");
ode_parameters=createLBodeContPars(model, random=TRUE);
dataSimulation=plotLBodeFitness(cnolistCNORodeExample, model, indices=indices);
plotLBodeModelSim

Simulate the model and plot the obtained with the different experimental conditions.

Description

Plots the simulated values of the logic based ODE model. Only dynamic states are plotted, i.e. those that are not inputs. A blue line. Additionally this functions returns the the simulated values.

Usage

```r
plotLBodeModelSim(cnolist, model, ode_parameters = NULL, indices = NULL, adjMatrix = NULL, timeSignals=NULL, time = 1, verbose = 0, transfer_function = 3, reltol = 1e-04, atol = 0.001, maxStepSize = Inf, maxNumSteps = 1e+05, maxErrTestsFails = 50, large = FALSE, nsplit = 4, show=T)
```

Arguments

- `cnolist`: A list containing the experimental design and data.
- `model`: The logic model to be simulated.
- `ode_parameters`: A list with the ODEs parameter information. Obtained with `createLBodeContPars`.
- `indices`: Indices to map data in the model. Obtained with `indexFinder` function from `CellNOptR`.
- `adjMatrix`: Model representation in the form of an adjacency matrix. When not provided will be automatically computed based in the model.
- `timeSignals`: An array containing a different time signals. If you use this argument, it will also modify the dimensions from valueSignals.
- `time`: An integer with the index of the time point to start the simulation. Default is 1.
- `verbose`: A logical value that triggers a set of comments.
- `transfer_function`: The type of used transfer. Use 1 for no transfer function, 2 for Hill function and 3 for normalized Hill function.
- `reltol`: Relative Tolerance for numerical integration.
- `atol`: Absolute tolerance for numerical integration.
- `maxStepSize`: The maximum step size allowed to ODE solver.
- `maxNumSteps`: The maximum number of internal steps between two points being sampled before the solver fails.
- `maxErrTestsFails`: Specifies the maximum number of error test failures permitted in attempting one step.
- `large`: Boolean variable defining if the plot should split into several subplots.
- `nsplit`: In case the large plot options is selected define how many subplots will exist. Default is 4.
- `show`: show the error (defaults to TRUE)
simdata2cnolist

Value

Returns a list with simulated Model values. One matrix of size number of species by number of experimental conditions for each time-point.

modelSimulation=plotLBodeModelSim(cnolistCNORodeExample, model,indices=indices);

-------------------------------------
simdata2cnolist converts output of getLBodeModelSim to cnolist
-------------------------------------

Description

This function converts the simulated data returned by getLBodeModelSim into a valid CNOlist data structure.

Usage

simdata2cnolist(sim_data, cnolist, model)

Arguments

sim_data structure returned by getLBodeModelSim
cnolist A list containing the experimental design and data.
model The logic model to be simulated.

Value

a CNOlist

CellNOptR createLBodeContPars
**Examples**

```r
data('ToyCNolist', package='CNORode');
data('ToyModel', package='CNORode');
data('ToyIndices', package='CNORode');
simdata = getLBodeModelSim(cnolistCNORodeExample, model, indices=indices)
cnolist = simdata2cnolist(simdata, cnolistCNORodeExample, model)
cnolist = simdata2cnolist(simdata, cnolistCNORodeExample, model)
```

**Description**

This function receives a set of inputs, namely the `cnolist` and the `model` and returns a list with the same size of the `cnolist$valueSignals`.

**Usage**

```
simulate(cnolist, model, ode_parameters=NULL, indices=NULL, adjMatrix=NULL, time=1, verbose=0, transfer_function=3, reltol=1e-04, atol=0.001, maxStepSize=Inf, maxNumSteps=1e+05, maxErrTestsFails=50)
```

**Arguments**

- `cnolist`: A list containing the experimental design and data.
- `model`: A list with the ODEs parameter information. Obtained with `createLBodeContPars`.
- `ode_parameters`: A list with the ODEs parameter information. Obtained with `makeParameterList` function.
- `indices`: Indices to map data in the model. Obtained with `indexFinder` function from `CellNOptR`.
- `adjMatrix`: The adjacency matrix. Recomputed if not provided.
- `time`: An integer with the index of the time point to start the simulation. Default is 1.
- `verbose`: A logical value that triggers a set of comments.
- `transfer_function`: The type of used transfer. Use 1 for no transfer function, 2 for Hill function and 3 for normalized Hill function.
- `reltol`: Relative Tolerance for numerical integration.
- `atol`: Absolute tolerance for numerical integration.
- `maxStepSize`: The maximum step size allowed to ODE solver.
- `maxNumSteps`: The maximum number of internal steps between two points being sampled before the solver fails.
- `maxErrTestsFails`: Specifies the maximum number of error test failures permitted in attempting one step.
simulate

Details

Check CellNOptR for details about the cnolist and the model format. For more details in the configuration of the ODE solver check the CVODES manual.

Value

Returns a list with simulated data that has the same structure as the cnolist$valueSignals. One matrix for each time-point.
