Package ‘GeneAnswers’

March 28, 2017

Type Package

Title Integrated Interpretation of Genes

Version 2.16.0

Date 2014-10-1

Depends R (>= 3.0.0), igraph, RCurl, annotate, Biobase (>= 1.12.0), methods, XML, RSQLite, MASS, Heatplus, RColorBrewer

Imports RBGL, annotate, downloader

Suggests GO.db, KEGG.db, reactome.db, biomaRt, AnnotationDbi, org.Hs.eg.db, org.Rn.eg.db, org.Mm.eg.db, org.Dm.eg.db, graph

Author Lei Huang, Gang Feng, Pan Du, Tian Xia, Xishu Wang, Jing, Wen, Warren Kibbe and Simon Lin

Maintainer Lei Huang <lhuang7@uchicago.edu> and Gang Feng <gilbertfeng@gmail.com>

Description GeneAnswers provides an integrated tool for biological or medical interpretation of the given one or more groups of genes by means of statistical test.

**GeneAnswers-package**

**Integrated Interpretation of Genes**

**Description**

GeneAnswers provide an integrated tool for biological or medical interpretation of the given one or more groups of genes by means of statistical test.

**Details**

Package: GeneAnswers  
Type: Package  
Version: 1.6.0  
Date: 2010-10-14  
License: LGPL version 2 or newer

**Author(s)**

Gang Feng, Lei Huang, Pan Du, Tian Xia, Xishu Wang, Jing, Wen, Warren Kibbe and Simon Lin  
Maintainer: Gang Feng <g-feng@northwestern.edu> and Lei Huang <lhuang7@uchicago.edu>

**References**

**Examples**

```r
data('humanExpr')
data('humanGeneInput')
x <- geneAnswersBuilder(humanGeneInput, 'org.Hs.eg.db', categoryType='GO.BP', testType='hyperG', pvalueT=0.01, FDR.correct=TRUE, geneExpressionProfile=humanExpr)
class(x)
```
buildNet

build and display a network for given IDs and interaction Matrix

Description

A function to build and display a network for given IDs and interaction Matrix with specified filtered IDs.

Usage

buildNet(graphIDs, idType=c('GO', 'GO.BP', 'GO.CC', 'GO.MF', 'GeneInteraction', 'Customized'), edgeM=NULL, annLib=c('org.Hs.eg.db', 'org.Mm.eg.db', 'org.Rn.eg.db', 'org.Dm.eg.db', 'customized'), output=c('interactive', 'fixed'), netMode=c('layer', 'connection'), vertexSize = NULL, edgeColor = NULL, colorMap=NULL, zeroColorIndex=NULL, matchMode=c('absolute', 'relative'), label=TRUE, directed=FALSE, direction=c('up', 'down', 'both'), showModeForNodes=c('nodes', 'filters'), verbose=TRUE, readable=TRUE, labelSize=1, labelColor='#666666', ...)

Arguments

- graphIDs: a character vector for given IDs
- idType: type of IDs, could be one of 'GO', 'GO.BP', 'GO.CC', 'GO.MF', 'GeneInteraction' and 'Customized'
- edgeM: a 2-column Matrix representing a network
- layers: an integer, specify how many layers will be retrieved.
- filterGraphIDs: a character vector for filtered IDs or a 2- or 3-column matrix for extra values.
- filterLayer: an integer, specify where filterGraphIDs are applied.
- annLib: type for annotation library, 'org.Hs.eg.db', 'org.Mm.eg.db', 'org.Rn.eg.db', 'org.Dm.eg.db' and 'customized'. For 'customized', edgeM is necessary
- output: type to specify output figure types
- netMode: type to show network, see details
- vertexSize: an integer, the size of vertices in the network, default is NULL
- edgeColor: a R compatible color type, the color of edges in the network, default is NULL
- colorMap: a R compatible color character vector, or NULL by embedded color scheme.
- zeroColorIndex: index of color corresponding to zero, see details
- matchMode: the mode of values matching colors, valid only if inputValue is not NULL, see details
- label: logic, specify whether put labels for non-given nodes in the network.
- directed: logic, the network is a directed or not
- direction: search direction, it could be 'up', 'down' and 'both'. Valid for directed network only.
- showModeForNodes: type, the show mode for nodes on the network, only valid if filterGraphIDs is not NULL, see details
- verbose: logic, specify to show information or not.
- readable: logic, specify whether show IDs or Terms/Names for nodes
- labelSize: an integer, the size of label for nodes
- labelColor: an R compatible color, default is #666666
- ... other parameters used by 'getCategoryTerms'
Details

Currently, if idType is 'GO', 'GO.BP', 'GO.CC' or 'GO.MF', edgeM will be ignore.

edgeM is a 2-column matrix. For directional connection, the direction is from column 1 elements to column 2 elements. For non-directional connection, each connection should be reversely presented twice, one is from column 1 element to column 2 element, while another is from column 2 element to column 1 element. In other words, non-directional connection is considered as two reverse directional connections.

filterGraphIDs are applied only at the filterLayer and more outer layers. This means the nodes between the filterLayer layer and the most external layer belong to the filterGraphIDs. The nodes between given graphIDs and the (filterLayer-1) layer are or are not from filterGraphIDs, but those nodes not in filterGraphIDs should be able to be finally connected by given graphIDs and filterGraphIDs.

There are two type of color matching methods. 'absolute' means, given zeroColorIndex that is color index in the colorMap for value 0, any value more than 0 will be matched to color between zeroColorIndex and the last one in colorMap based on the ratio of the value to the maximum of the inputValue, while the value less than 0 will be matched to color between the first color in colorMap and zeroColorIndex, also based on the ratio of the value to the minimum of the inputValue.

showModeForNodes stands for, if the filterGraphIDs is not NULL, some or all of filterGraphIDs could be nodes for given IDs multiple search. If it is set to ‘nodes’, it means only the values of nodes in the display network will be used to match color by matchMode. For ‘filters’, it means the values of all filter nodes will be used to match color. If values for color of nodes in the network are not large, while the maximum of color of filter nodes is large, it is recommended to set to ‘nodes’, or it is difficult to see difference for the nodes. For comparing two networks, for example, one is up-search and another is down-search for the same IDs, it is better to set to ‘absolute’ for easy comparisons.

There are two types of output figures. "Fixed" means a network will be drawn on a regular R canvas, while "interactive" will generate a tck/tk canvas. Users can adjust nodes on it by mouse.

If the filterGraphIDs is a ID vector. The filterGraphIDs nodes will be black, others will be white. If filterGraphIDs is a 2- or 3-column matrix, the 1st column is filter IDs and 2nd column is for color of nodes. If the 3rd column is available, it is for size of nodes.

There are two types of netMode. 'layer' means size of nodes will be smaller and smaller for more and more external layers. And also color of edges change for different layers. 'connection' mode just distinguish direct or indirect connection. The size of the given IDs the largest. However, if filterGraphIDs is a 3-column matrix, the size of nodes will be determined by the 3rd column of filterGraphIDs.

The graphIDs nodes are yellow circled solid dots. Color depends on colorMap and filterGraphIDs 2nd column. If no value available, all given graphIDs filterGraphIDs nodes are black, others are white.

Value

invisibly return a list containing elements to represent a network.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>caBIO2entrez</td>
<td>map caBIO gene IDs to Entrez gene IDs</td>
</tr>
</tbody>
</table>

**Description**

Function to map the given caBIO gene IDs to the Entrez gene IDs. This function is not supported starting this version due to the termination of the caBig project.

**Usage**

```
caBIO2entrez(caBIOIds)
```

**Arguments**

- `caBIOIds` an caBIOIds gene IDs vector

**Value**

return a Entrez genes ID list, names of the list are the given caBIO gene IDs and elements are Entrez gene IDs.

**Author(s)**

Gang Feng, Pan Du and Simon Lin

**References**

**Examples**

```
## Not run: caBIO2entrez(c('2933', '7326'))
```
categoryNet

Plot Category Links

Description

Function to plot a linkages of specified categories.

Usage

categoryNet(catGenesList, centroidSize=NULL, output=c('fixed','interactive'))

Arguments

catGenesList   a list of categories.
centroidSize   a numeric vector to specify the size of concept nodes. If NULL, all of concept
                nodes are represented as the same size solid circles.
output         type to specify output figure types.

Details

catGenesList is a list of categories. Each element contains the genes in the corresponding category,
respectively. And the names of the list are categories. If centroidSize is a numeric vector, its values
are mapped to the categories in the catGenesList sequentially.

Value

A category linkage is generated.

Examples

input <- list('cat1'=c(1,4,2,5), 'cat2'=c(3,5,8,9), 'cat3'=c(2,4,5,9), 'cat4'=c(1,5,3))
## Not run: categoryNet(input)
**chartPlots**  
*Pie Chart and Bar Plots*

**Description**

Make pie chart and bar plot based on the given data frame.

**Usage**

```
chartPlots(x, chartType = c("pieChart", "barPlot", "all"), specifiedCols = c("genes in Category"),
```

**Arguments**

- `x`: a data frame to be used for pie chart and box plot
- `chartType`: plot type, "pieChart", "barPlot" or both could be specified.
- `specifiedCols`: the column will be used to be represented.
- `top`: number to specify how many first categories will be drawn.
- `newWindow`: logic, determine whether draw on a new canvas.
- `...`: additional arguments passed to piechart or barplot.

**Details**

- `chartType` could be pie chart, bar plot or both (parameter is "all"). `specifiedCols` is the column that will be used to plot. It could be column name or number. If `chartType` is set to 'all', the barplot will be drawn on a new canvas whatever `newWindow` is set to TRUE or FALSE.

**Value**

A pie chart and/or barplot are generated depends on specification.

**Author(s)**

Gang Feng, Pan Du and Simon Lin

**References**

**Examples**

```R
x <- matrix(c(6,9,3,30,13,2,15,20), nrow = 4, ncol=2, byrow=FALSE, 
dimnames = list(c("group1", "group2", "group3", "group4"),
               c("value1", "value2")))
chartPlots(x, chartType='all', specifiedCol = "value2", top = 3)
```
**DmIALite**

*Fly gene interaction matrix*

**Description**

Preprocessed fly gene interaction matrix

**Usage**

```r
data(DmIALite)
```

**Details**

a 4-column matrix containing fly interacted genes and evidences

**References**

**Examples**

```r
data(DmIALite)
DmIALite[1:4,]
```

---

**DO**

*Several data objects related with DO (Disease Ontology) and its mapping to genes*

**Description**

Several data objects related with DO (Disease Ontology) and its mapping to genes

**Usage**

```r
data(DO)
```

**Details**

The data file "DO.rda" includes five datasets:

- **DO.graph.gene**: a graphNEL object, which shows the ontology relations of DO
- **DO.graph.closure.gene**: a graphNEL object, whose edges represent the link between a DO term and its offspring ontology terms. Only the DO terms with gene mappings were included.
- **DO2gene.map**: a list show the mapping from DOIDs to genes
- **gene2DO.map**: a list show the mapping from genes to DOIDs
- **DO.terms**: a named character vector. Its names are DOIDs and elements are DO.terms
Examples

```r
data(DO)

datasets <- c("DO.graph.gene", "DO.graph.closure.gene", "DO2gene.map", "gene2DO.map", "DO.terms")
# check the existence of these datasets:
sapply(datasets, exists)
```

---

DOLite **Disease Ontology Annotation List**

Description

Disease Ontology Annotation List

Usage

```r
data(DOLite)
```

Details

a standard list, whose names are DOLite IDs and each element contains the gene Entrez IDs belonging to the corresponding DOLite IDs.

Source

~~ reference to a publication or URL from which the data were obtained ~~

References

Examples

```r
data(DOLite)
DOLite[1:2]
```

---

DOLiteTerm **Disease Ontology Annotation Vector**

Description

Disease Ontology Annotation Vector

Usage

```r
data(DOLiteTerm)
```
Details

a character vector, where names are DOLite IDs and elements are Terms

Source

~~ reference to a publication or URL from which the data were obtained ~~

References

Examples

data(DOLiteTerm)
DOLiteTerm[1:10]

drawTable
Concept-Gene Networking Plotting

Description
A function to generate a multigroup concepts-genes table

Usage

drawTable(dataMatrix, topCat=10, heatMap=TRUE, matrixOfHeatmap=NULL, clusterTable=c('geneNum', 'p'), addRowLabel=TRUE, cex.axis=c(1.1, 0.9), reverseOfCluster=FALSE, xGridLine=FALSE, colorBar=TRUE, newWindow=TRUE, endOfColBar=c(>0.01, Minimum of p values), heatMapColor=c('#00ff00', '#ffffff'), canvasWidth=NULL, canvasHeight=NULL, ...)

Arguments

dataMatrix a top concepts-genes matrix generated by getConceptTable.
topCat number to specify how many top concepts-genes analysis will show.
heatMap logic, determine whether the multiple group concepts-genes table is presented by heatmap.
matrixOfHeatmap NULL or a concepts-genes matrix generated by getConceptTable, which is used to show enrichment test significance for each concept.
clusterTable cluster data to specify which type of values will be used for cluster.
methodOfCluster cluster method
mar marginal parameter for table, please see par
addRowLabel logic, whether add row names
cex.axis font size parameter for table, please see par
reverseOfCluster logic, whether reverse the cluster order.
xGridLine logic, whether add horizontal line in table or not
entrez2caBIO

map Entrez gene IDs to caBIO gene IDs

description

Function to map the given Entrez gene IDs to the caBIO gene IDs. This function is not supported starting this version due to the termination of the caBig project.

Usage

entrez2caBIO(lls)
geneAnnotationHeatmap

Arguments

l1s an Entrez gene IDs vector

Value

return a caBIO genes ID list, names of the list are Entrez gene IDs and elements are caBIO gene IDs.

Author(s)

Gang Feng, Pan Du and Simon Lin

References

Examples

## Not run: entrez2caBIO(c('1647', '596'))

---

geneAnnotationHeatmap  Make a concept-gene cross tabulation

Description

Function to make a concept-gene cross tabulation

Usage

geneAnnotationHeatmap(annotationList, dataMatrix = NULL, addGeneLabel = TRUE, colorMap = c("#000000", "#FFFFFF"), sortBy ..., standardize.data, colorMap.data, showGeneMax, sortBy.data, mar)

Arguments

annotationList a list of annotation to gene mapping.

dataMatrix a 2-dimensional numeric matrix. If it is provided, it will be plot side by side with the annotation heatmap.

addGeneLabel logic, indicate whether add gene labels

colorMap vector to specify color map of the two-color annotation heatmap

sortBy string to specify whether to sort the annotation matrix by row, column, both row and column or none of them

standardize.data logic, specify whether to standardize the dataMatrix by row

colorMap.data string to specify color map of the dataMatrix heatmap

showGeneMax an integer, the maximum of gene number to show genes id or symbol on the heatmap

sortBy.data string to specify whether to sort the dataMatrix by row, column, both row and column or none of them

mar integer vector to specify margin of the plot
GeneAnswers-class
GeneAnswers-class
Class GeneAnswers: contain and describe the relationship between given gene data and specified category

Description
This is a class representation of the relationship between given gene data and specified category.

Creating Objects
Objects can be created using the function geneAnswersBuilder.
GeneAnswers-class

Slots
Slot specific to GeneAnswers:

geneInput: a data frame containing gene Entrez IDs with or without any values. Current version only supports gene Entrez IDs. The values could be foldChange, p value, or other values. These data can be used for concept-gene network. Genes with positive values will be represented as red nodes, while negative value genes are green nodes.

testType: statistical test method. Current version supports hypergeometric test to test relationship between genes and specified categories.
pvalueT: the cutoff value of statistical test. Any categories will not be reported if the p value is more than the cutoff.
genesInCategory: a list containing genes belonging to categories. The names of the list are categories.
geneExprProfile: a data frame to store gene expression data. If not available, it could be NULL.
annLib: annotation database used for statistical test.
categoryType: functional or medical category used for statistical test.
enrichmentInfo: a data frame containing filtered categories with statistical results by specified pvalueT.

Methods

Class-specific methods:

geneInput(GeneAnswers): Access the geneInput slot of GeneAnswers object.

testType(GeneAnswers): Access the testType slot of GeneAnswers object.
pvalueT(GeneAnswers): Access the pvalueT slot of GeneAnswers object.

genesInCategory(GeneAnswers): Access the genesInCategory slot of GeneAnswers object.

geneExprProfile(GeneAnswers): Access the geneExprProfile slot of GeneAnswers object.

annLib(GeneAnswers): Access the annLib slot of GeneAnswers object.

categoryType(GeneAnswers): Access the categoryType slot of GeneAnswers object.
enrichmentInfo(GeneAnswers): Access the enrichmentInfo slot of GeneAnswers object.

setGeneInput(GeneAnswers, geneInput): Assign the geneInput slot of GeneAnswers object.

setTestType(GeneAnswers, type=c('hyperG', 'none')): Assign the testType slot of GeneAnswers object.

setPvalueT(GeneAnswers, pvalueT): Assign the pvalueT slot of GeneAnswers object.

setGenesInCategory(GeneAnswers, genesInCategory): Assign the genesInCategory slot of GeneAnswers object.

setGeneExprProfile(GeneAnswers, geneExprProfile): Assign the geneExprProfile slot of GeneAnswers object.

setAnnLib(GeneAnswers, annLib): Assign the annLib slot of GeneAnswers object.

setCategoryType(GeneAnswers, type=c('GO', 'GO.BP', 'GO.CC', 'GO.MF', 'DOLITE', 'KEGG', 'REACTOME', 'CABIO.PATH', 'User defiend')): Assign the categoryType slot of GeneAnswers object.

setEnrichmentInfo(GeneAnswers, enrichmentInfo): Assign the enrichmentInfo slot of GeneAnswers object.

summary(GeneAnswers): Briefly summarize the information of GeneAnswers object and show contents of GeneAnswers object.

show(GeneAnswers): Briefly show contents of GeneAnswers object.
geneAnswersBuilder

Author(s)
Gang Feng, Pan Du and Simon Lin

References

geneAnswersBuilder

Examples
data('humanExpr')
data('humanGeneInput')
x <- geneAnswersBuilder(humanGeneInput, 'org.Hs.eg.db', categoryType='GO.BP', testType='hyperG', pvalueT=0.01, FDR.correct=TRUE, geneExpressionProfile=humanExpr)
class(x)

Description
A function to build an object of a GeneAnswers class based on given information.

Usage
geneAnswersBuilder(geneInput, annotationLib, categoryType = NULL, testType = c("hyperG", "none"), known=TRUE, ...
geneExpressionProfile, categorySubsetIDs = NULL, pvalueT = 0.01, FDR.correction = FALSE, verbose=TRUE, sortBy=c("pvalue", "geneNum", "foldChange", "oddsRatio", "correctedPvalue", "none"), ...

Arguments
geneInput a dataframe containing gene IDs and possible values associated with given gene IDs.
annotationLib name of given annotation library file or user provided annotation list.
categoryType name of given annotation category or NULL for user provided annotation list.
testType name of enrichment test.
known logic, specify only known annotation gene enrichment test.
totalGeneNumber number of total genes to perform hypergeometric test.
geneExpressionProfile data frame containing gene expression file or NULL.
categorySubsetIDs a character vector of user-specified subset of categories to be tested.
pvalueT p-value threshold of the enrichment test.
FDR.correction logic, indicating if FDR correction of the enrichment test p-value is performed or not.
verbose logic, display current building stage.
sortBy sorted type
... additional arguments passed to getGOList.
Details

As the input of geneAnswersBuilder, geneInput could be a character vector (Gene Entrez ID vector), a matrix or a dataframe. For the matrix and dataframe, the first column is for Gene Entrez IDs, while other columns could be any interested values that could be used to represent gene expression direction for generating concepts-genes network. Rownames are not necessary.

annotationLib could be Disease Ontology library, Entrez annotation libraries for a specie, such as ‘org.Hs.eg.db’. Current version supports "org.Ag.eg.db", "org.Be.eg.db", "org.Ce.eg.db", "org.Cf.eg.db", "org.Dm.eg.db", "org.Dr.eg.db", "org.Ec12.eg.db", "org.EcSakai.eg.db", "org.Gg.eg.db", "org.Hs.eg.db", "org.Mm.eg.db", "org.Mmu.eg.db", "org.Pt.eg.db", "org.Rn.eg.db", "org.Ss.eg.db", "org.Xl.eg.db", "org.At.tair.db", "org.Pf.plasmo.db" and "org.Sc.sgd.db". User can also use own annotation library. User’s annotation library should be a list. Each element in this list is a vector of genes for a user-specified category. Names of this annotation list are categories’ names.

categoryType could be "GO", "GO.BP", "GO.CC", "GO.MF", "DOLITE", "KEGG", "REACTOME.PATH" and "CA BIO.PATH". "GO.BP" only test biological process Gene Ontology terms, "GO.CC" for cellular components, "GO.MF" for molecular functions, "GO" for all of these three categories, "KEGG" for all KEGG pathways, and "REACTOME.PATH" for all REACTOME pathways. For user provided annotation library, it should be NULL in most cases.

"caBIO.PATH", which was for NCI-Nature curated, Biocarta and REACTOME, is not supported starting this version because of the termination of caBig project.

If known is set to TRUE, the enrichment test only considers the genes with annotation. If FALSE, the total number of genes in that species will be returned. If user has own annotationLib, totalGeneNumber should be an integer, or one of "anopheles", "arabidopsis", "bovine", "worm", "canine", "fly", "zebrafish", "ecolistraink12", "ecolistrainsakai", "chicken", "human", "mouse", "rhesus", "malaria", "chimp", "rat", "yeast", "pig" and "xenopus". NULL only works when "known" is set TRUE. geneAnswersBuilder will automatically assign the corresponding value to totalGeneNumber. User can get total gene numbers by getTotalGeneNumber, too.

sortBy could be one of "geneNum", "pvalue", "foldChange", "oddsRatio", "correctedPvalue" and "none". Default value is 'pvalue'.

Value

A GeneAnswers class containing geneInput, enrichmentInfo, etc.

geneAnswersChartPlots  Make pie chart and bar plot

Description
Make pie chart and bar plot for given GeneAnswers instance

Usage
geneAnswersChartPlots(x, chartType=c("pieChart", "barPlot", "all"), sortBy = c("geneNum", "pvalue"), newWindow=TRUE, ...

Arguments
  x             a GeneAnswers instance
  chartType     plot type, "pieChart", "barPlot" or both could be specified.
  sortBy        the column will be used to be represented.
  newWindow     logic, determine whether draw on a new canvas.
  ...           additional arguments passed to piechart or barplot.

Details
chartType could be pie chart, bar plot or both (parameter is "all"). specifiedCols is the column of enrichmentInfo that will be used to plot. It could be one of 'genes in Category', 'p value' or 'fdr p value'. If chartType is set to 'all', the barplot will be drawn on a new canvas whatever newWindow is set to TRUE or FALSE.

Value
A pie chart and/or barplot are generated depends on specification.

## Not run: geneAnswersChartPlots(x)
geneAnswersConceptNet  

geneAnswersConceptNet  **Concept-Gene Networking Plotting**

**Description**

A function to generate a concept-gene network by given gene information

**Usage**

```r
geneAnswersConceptNet(x, colorValueColumn = NULL, centroidSize = c("pvalue", "geneNum", "foldChange", "oddsRatio", ... "none"), showCats=c(1:5), geneLayer=1, edgeM=NULL, catTerm=FALSE, geneSymbol=FALSE, catID=FALSE, nameLength=...)
```

**Arguments**

- `x`  
a GeneAnswers instance.
- `colorValueColumn`  
  number or column name of geneInput slot to specify the colors of leaves
- `centroidSize`  
type to represent the size of concepts.
- `output`  
  output type of final output.
- `showCats`  
a numeric or string vector specified categories
- `geneLayer`  
an integer, specify how many layers of genes connecting to concepts
- `edgeM`  
a 2-column Matrix representing a network
- `catTerm`  
a logic value to specify whether mapping category IDs to category names
- `geneSymbol`  
a logic value to specify whether mapping gene IDs to gene symbols
- `catID`  
a logic value to specify whether show category IDs when catTerm is set to TRUE
- `nameLength`  
show how many first letters for long term names, ‘all’ for full name
- `...`  
other parameters used by `geneConceptNet`

**Details**

colorValueColumn specifies which column of the geneInput of the GeneAnswers instance is used for color of nodes. centroidSize could be one of "geneNum", "pvalue", "foldChange", "oddsRatio", "correctedPvalue". Each one defines to which the size of concept dot is proportional geneNum: number of genes connecting to the concept pvalue: p value of enrichment test foldChange: fold of gene overrepresent in concepts oddsRatio: odds ratio of enrichment test correctedPvalue: adjusted p value of enrichment test output defines whether the final figure is interactive or not. Interactive figure calls igraph package to generate a tcltk canvas. Fixed figure is a non-interactive png figure. None will not output any figure but a list. See details in `geneConceptNet`

**Value**

One concept-gene figure is generated. It could be a R figure or tcltk figure depends on how the user set parameter output.

geneAnswersConceptRelation

Display a network related to given concepts for a GeneAnswers instance

Description

A function to display a network related to given concepts of a GeneAnswer instance

Usage

geneAnswersConceptRelation(x, showCats=c(1:5), conceptsIDs=NULL, directed=TRUE, direction=c('up', 'down', 'both'), catTerm=TRUE, catID=FALSE, nameLength=all, ...)

Arguments

x a GeneAnswers instance
showCats a numeric or string vector specified categories
conceptsIDs a vector or a data frame or matrix containing possible relative concepts, see details
directed logic, the network is a directed or not
direction search direction, it could be 'up', 'down' and 'both'. Valid for directed network only.
catTerm a logic value to specify whether mapping category IDs to category names
catID a logic value to specify whether show category IDs when catTerm is set to TRUE
nameLength show how many first letters for long term names, 'all' for full name
... other parameters used by 'getConnectedGraph'

Details

conceptsIDs could be a character vector or a data frame or a matrix. As a character vector, it is a group of concept IDs or names depending on the given GeneAnswers instance, which are used to be a group of filters to draw a network relative to given concepts specified by showCats. When it is a data frame or matrix, it could be a 2- or 3-column data frame or matrix. The column 2 is always used to be represent nodes color, while the 3rd column is for size of nodes if available.
geneAnswersConcepts

Value
return a invisible list representing the network.

Author(s)
Gang Feng, Pan Du and Simon Lin

geneAnswersConceptRelation

Examples
```r
cengageAnswersConceptRelation(x, UP=FALSE, directed=TRUE, netMode='connection')
```

Description
A function to generate a concept-gene network by given gene information

Usage
geneAnswersConcepts(x, centroidSize=c("geneNum", "pvalue", "foldChange", "oddsRatio", "correctedPvalue"), output=c("fixed", "interactive"), showCats=1:5, catTerm=FALSE, catID=FALSE)

Arguments
- `x`: a GeneAnswers instance.
- `centroidSize`: type to represent the size of concepts.
- `output`: output type of final output.
- `showCats`: a numeric or string vector specified categories
- `catTerm`: a logic value to specify whether mapping category IDs to category names
- `catID`: a logic value to specify whether show category IDs when catTerm is set to TRUE

Details
centroidSize could be one of "geneNum", "pvalue", "foldChange", "oddsRatio", "correctedPvalue". Each one defines to which the size of concept dot is proportional geneNum: number of genes connecting to the concept pvalue: p value of enrichment test foldChange: fold of gene overrepresent in concepts oddsRatio: odds ratio of enrichment test correctedPvalue: adjusted p value of enrichment test output defines whether the final figure is interactive or not. Interactive figure calls igraph package to generate a tck/tk canvas. Fixed figure is a non-interactive png figure.
geneAnswersHeatmap

Value

One category-linkage figure is generated. It could be a R figure or tcltk figure depends on how the user set parameter output.

geneAnswersHeatmap   Generate Concept-Gene Tabulates

Description

A function to generate specified Concept-Gene Tabulates

Usage

geneAnswersHeatmap(x, showCats = c(1:5), catTerm = FALSE, geneSymbol = FALSE, catID=FALSE, nameLength=

Arguments

x               an instance of GeneAnswers objects
showCats        a numeric or string vector specified categories
catTerm         a logic value to specify whether mapping category IDs to category names
geneSymbol      a logic value to specify whether mapping gene IDs to gene symbols
catID           a logic value to specify whether show category IDs when catTerm is set to TRUE
nameLength      show how many first letters for long term names, 'all' for full name
showAllGenes    logic, show all genes in the heatmap or not
...              other parameters used by geneAnnotationHeatmap

Details

This function generates concept-gene tabulates for an input GeneAnswers instance. The concept-gene tabulates contain two maps. Left side is a heatmap based on given expression matrix. Right side is a concept-gene map, which could be represented as two-color heatmap or table.
Value

The function will generate a map without return value.

Examples

example(GeneAnswers)
## Not run: geneAnswersHeatmap(x, catTerm=TRUE, geneSymbol=TRUE)

geneAnswersHomoMapping

Mapping homogenes for a GeneAnswers instance

Description

A function to mapping homogenes in all of slots of a GeneAnswer instance

Usage

geneAnswersHomoMapping(x, species = c("human", "rat", "mouse", "fly"), speciesL = c("human", "rat"), mappingMethod = c("direct", "biomaRt", "none"), filterGenes = NULL, verbose = TRUE)

Arguments

x            a GeneAnswers instance
species      species of the current genes
speciesL     species of the mapped genes
mappingMethod mapping method, see details
filterGenes  a gene symbol vector to filter genes
verbose      logical, show current stage or not

Details

There are two mapping methods supported by current version. "direct" only works between human and mouse because most of human gene symbols are capitalized and only the first letter is uppercase for those homogenes in mouse. Another way is by means of package "biomaRt", which contains more information while the network connection is necessary to access biomaRt online server. Since two methods are based on different mechanisms, it is highly recommended to employ same method during mapping. Each method might introduce more homogenes, so users can remove ones that do not belong to original genes by optional "filterGeneList".
Value

return a mapped GeneAnswers instance

Author(s)

Gang Feng, Pan Du and Simon Lin

Examples

eexample(GeneAnswers)

## Not run: geneAnswersHomoMapping(x, species='human', speciesL='mouse', mappingMethod='direct')

---

**geneAnswersReadable**  
*Make GeneAnswers Instance readable*

Description

a function to mapping category IDs and gene IDs to names and symbols.

Usage

geneAnswersReadable(x, catTerm = TRUE, geneSymbol = TRUE, strict = FALSE, verbose=TRUE, missing=c(name, keep, remove), ...)

Arguments

- **x**: a GeneAnswers instance containing category IDs and gene IDs
- **catTerm**: logic value to determine whether mapping category IDs to names
- **geneSymbol**: logic value to determine whether mapping gene IDs to symbols
- **strict**: logic value to determine whether interrupt conversion if NA is introduced.
- **verbose**: logical, show current stage or not
- **missing**: type of handling NA mapping.
- **...**: other parameters used by getCategoryTerms

Details

Conversion could stop if NA is introduced and strict is set to TRUE. There are three types of parameters for variable 'missing'. 'name' means the NA mapping values are replaced by their names. 'keep' means all of NA values are kept. 'remove' means all of NA values are removed. Occasionally, Reactome uses the same name for species-mixed pathways based on in vivo and in vitro experiments, so we highly recommend to set addID as TRUE for Reactome test.
value

return a GeneAnswers instance with category names and/or gene symbols.

table

geneAnswersSort  
Sort enrichmentInfo of a GeneAnswers instance

description

a function to sort enrichmentInfo data frame in GeneAnswers objects.

Usage

geneAnswersSort(x, sortBy = c("geneNum", "pvalue", "foldChange", "oddsRatio", "correctedPvalue"))

Arguments

x  
a GeneAnswers instance

sortBy  
sorted type

details

sortBy could be one of "geneNum", "pvalue", "foldChange", "oddsRatio" and "correctedPvalue".

value

return a new GeneAnswers instance with sorted by the specified type.

Author(s)

Gang Feng, Pan Du and Simon Lin

geneConceptNet

Generate Concept-gene network

Description

Function to generate concept-gene network based on given list.

Usage

geneConceptNet(inputList, lengthOfRoots=NULL, inputValue = NULL, centroidSize = "geneNum", output = c("fixed", "interactive", "none"), colorMap=NULL, bgColor=

Arguments

inputList a character list to generate concept-gene network. Names of the list are concepts.
lengthOfRoots an integer, how many first elements could be root nodes.
inputValue NULL or a numeric vector to be used for color of nodes.
centroidSize 'geneNum' or a numeric vector to specify the size of concept nodes.
output type to specify output figure types
colorMap a R compatible color character vector, or NULL by embedded color scheme.
bgColor a R compatible color, default is '#ffffff' (white)
mismatchMode the mode of values matching colors, valid only if inputValue is not NULL, see details
zeroColorIndex index of color corresponding to zero, see details
verbose logic, determine whether show messages
symmetry logic, determine whether positive and negative values use the same color level.

details

The color of gene nodes could be specified by inputValue. Its length should be same as the total number of unique genes in inputList. There are two type of color matching methods. 'absolute' means, given zeroColorIndex that is color index in the colorMap for value 0, any value more than 0 will be matched to color between zeroColorIndex and the last one in colorMap based on the ratio of the value tothe maximum of the inputValue, while the value less than 0 will be matched to color between the first color in colorMap and zeroColorIndex, also based on the ratio of the value to the minimum of the inputValue. 'relative' means, set the first and last colors in colorMap to minimum and maximum of the inputValue, respectively, then any value between them will be mapped. If colorMap is set to NULL, the default color scheme will be applied. If the matching method is 'absolute', the color of 0 or the median of inputValue for 'relative' method, is set by bgColor, default value is "#fffffff" (white). The most positive value is represented as "#ff0000" (red), "#00ff00" (green) for the most negative value.

There are two types of output figures. "Fixed" means a network will be drawn on a regular R canvas, while "interactive" will generate a tck/tk canvas. Users can adjust nodes on it by mouse. "none" means no graphics output and return the attributes of vertices and edges.

getcaBIOPATHList  Retrieve caBIO path categories containing given genes

Description

Function to retrieve caBIO pathway IDs containing the given genes. This function is not supported starting this version due to the termination of the caBig project.

Usage

getcaBIOPATHList(lls)

Arguments

lls  an Entrez gene IDs vector

Details

The given gene IDs should be Entrez gene IDs. And the return list also only contains Entrez gene IDs besides caBIO pathway IDs.

Value

return an Entrez genes ID list, names of the list are caBIO pathway IDs and elements are Entrez gene IDs.

getcaBIOPATHTerms Get Pathway names of given REACTOME PATH_DB IDs

Description
Function to map given caBIO pathway IDs to Pathway names. This function is not supported starting this version due to the termination of the caBig project.

Usage
getcaBIOPATHTerms(caBIOPATHIDs)

Arguments
caBIOPATHIDs a caBIO pathway IDs vector

Details
caBIO(Cancer Bioinformatics Infrastructure Objects, https://cabig.nci.nih.gov/tools/cabio) integrates three pathway databases from NCI-Nature curated, Biocarta and Reactome. Therefore, terms could be same from different databases and the source library is added the end of each term.

Value
return the caBIO pathway terms of given caBIO pathway IDs.

Author(s)
Gang Feng, Pan Du and Simon Lin

References

Examples

## Not run: getcaBIOPATHTerms(c('7622', '289', '7173'))
getCategoryList

Retrieve categories containing given genes

Description

Function to retrieve specified category IDs containing given genes.

Usage

getCategoryList(geneVector, lib, categoryType)

Arguments

geneVector: an Entrez gene IDs vector
lib: annotation library to be used to retrieve categories terms.
categoryType: type of category

Details

The current version only supports Bioconductor team maintained annotation libraries, like 'org.Bt.eg.db', 'org.Ce.eg.db', 'org.Cf.eg.edu', 'org.Dm.eg.db', 'org.Dr.eg.db', 'org.EcK12.eg.db', 'org.EcSakai.eg.db', 'org.Gg.eg.db', 'org.Hs.eg.db', 'org.Mm.eg.db', 'org.Rn.eg.db' and 'org.Ss.eg.db'.

Value

return a category list, names of the list are category IDs and elements are genes IDs.

Author(s)

Gang Feng, Pan Du and Simon Lin

References

Examples

getCategoryList(c('56458', '16590'), 'org.Mm.eg.db', 'PATH')
**getCategoryTerms**

Mapping Category IDs to Terms

**Description**

Function to map category IDs to category terms.

**Usage**

```r
getCategoryTerms(catIDs, catType, strict = FALSE, missing=c('name', 'keep', 'remove'), nameLength=all, addID=FALSE)
```

**Arguments**

- `catIDs`: a character vector containing category IDs
- `catType`: type of category
- `strict`: logic value to stop conversion if NA is introduced.
- `missing`: type of handling NA mapping.
- `nameLength`: show how many first letters for long term names, 'all' for full name
- `addID`: logic, add term IDs following term names or not

**Details**

The current version only supports 'GO', 'DOLITE', 'KEGG', 'REACTOME.PATH' and 'CABIO.PATH'. There are three types of parameters for variable 'missing'. 'name' means the NA mapping values are replaced by their names. 'keep' means all of NA values are kept. 'remove' means all of NA values are removed.

**Value**

return category terms of given category IDs.

**Author(s)**

Gang Feng, Pan Du and Simon Lin

**References**

**Examples**

```r
getCategoryTerms(c("04640", "05221", "05215"), catType='KEGG')
```
**getConceptTable**

---

**Generate top concepts-genes table**

**Description**

Function to generate a top concepts-genes table based on a given GeneAnswers instance list.

**Usage**

```
getConceptTable(gAList, topCat=10, items=c('both', 'geneNum', 'pvalue'), sortBy = c('pvalue', 'geneNum', 'foldChange', 'oddsRatio', 'correctedPvalue'), catTerm=TRUE, strict=FALSE)
```

**Arguments**

- `gAList`: a GeneAnswers instance list
- `topCat`: a numeric or string vector specified categories
- `items`: specify the contents in cells, see details
- `sortBy`: sorted type
- `catTerm`: a logic value to specify whether mapping category IDs to category names
- `strict`: logic value to stop conversion if NA is introduced.

**Details**

A list containing two top concepts-genes tables is generated. The first table consists of gene amounts and enrichment test p values if `items` is set to "both". Only gene amounts are kept if `items` is set to "geneNum" or enrichment test p values if it is set to "p values", while the second table contains enrichment test p values.

**Value**

return a concepts-genes matrix list.

**Author(s)**

Gang Feng, Pan Du and Simon Lin

**References**

**See Also**

geneAnswersBuilder

**Examples**

data(sampleGroupsData)
gAKEGGL <- lapply(sampleGroupsData, geneAnswersBuilder, 'org.Hs.eg.db', categoryType="KEGG", pvalueT=0.1, verbose=FALSE)
output<- getConceptTable(gAKEGGL)
getConnectedGraph

**Description**

A function to build and display a network by different show types for given IDs and interaction Matrix with specified filtered IDs.

**Usage**

```r
getConnectedGraph(graphIDs, idType=c('GO', 'GO.BP', 'GO.CC', 'GO.MF', 'GeneInteraction', 'Customized'), searchAll=FALSE, showAllNodes=FALSE, directed=FALSE, direction=c('up', 'down', 'both'), filterGraphIDs=NULL, filterLayer=1, verbose=TRUE, ...)```

**Arguments**

- `graphIDs` a character vector for given IDs
- `idType` type of IDs, could be one of ‘GO’, ‘GO.BP’, ‘GO.CC’, ‘GO.MF’, ‘GeneInteraction’ and ‘Customized’
- `edgeM` a 2-column Matrix representing a network
- `limitedLayers` logic, user specified layers to stop search
- `layers` an integer, specify how many layers will be retrieved.
- `treeMergeFilter` logic, determine whether apply filterGraphIDs during searching a merged tree, see details
- `searchAll` logic, determine whether search all nodes
- `showAllNodes` logic, determine whether show all nodes based on searching result
- `directed` logic, the network is a directed or not
- `direction` search direction, it could be ‘up’, ‘down’ and ‘both’. Valid for directed network only.
- `filterGraphIDs` a character vector for filtered IDs or a 2- or 3-column matrix for extra values.
- `filterLayer` an integer, specify where filterGraphIDs are applied.
- `verbose` logic, specify to show information or not.
- `...` other parameters used by ‘buildNet’

**Details**

Currently, if `idType` is ‘GO’, ‘GO.BP’, ‘GO.CC’ or ‘GO.MF’, `edgeM` will be ignored.

`edgeM` is a 2-column matrix. For directional connection, the direction is from column 1 elements to column 2 elements. For non-directional connection, each connection should be reversely presented twice, one is from column 1 element to column 2 element, while another is from column 2 element to column 1 element. In other words, non-directional connection is considered as two reverse directional connections.

`filterGraphIDs` are applied only at the `filterLayer` and more outer layers. This means the nodes between the `filterLayer` layer and the most external layer belong to the `filterGraphIDs`. The nodes between given `graphIDs` and the (`filterLayer-1`) layer are or are not from `filterGraphIDs`, but those nodes not in `filterGraphIDs` should be able to be finally connected by given `graphIDs` and `filterGraphIDs`. 
The function at first searches a merged tree based on given IDs. During searching, filterGraphIDs could be applied if ‘treeMergeFilter’ is set to TRUE. If a merged tree is found, searching process stops unless ‘searchAll’ is set to TRUE. However, ‘limitedLayers’ is set to TRUE, searching process also stops when searching layers reach ‘layers’. Only all filterGraphIDs specified nodes as well as given nodes will be displayed if ‘showAllNodes’ is set to FALSE, or all connected nodes will be displayed.

See buildnet for network layout.

Value

invisibly return a list containing elements to represent a network.

getDOLiteTerms  

Get DOLite Terms of Given DOLite IDs

Description

function to map DOLite IDs to DOLite Terms

Usage

```r
getDOLiteTerms(DOLiteIDs)
```

Arguments

- **DOLiteIDs**  
a character vector containing DOLite IDs

Value

return a DOLite term vector based on given DOLite IDs.
getGOList

Author(s)
Gang Feng, Pan Du and Simon Lin

References

getCategoryTerms

Examples
data('DOLiteTerm')
getDOLiteTerms(c('DOLite:25', 'DOLite:142'))

getGOList

Get GO list of given genes

Description
Retrieve GO IDs based on given gene IDs.

Usage
getGOList(geneVector, lib, GOCat = c("ALL", "BP", "CC", "MF"), level = 1)

Arguments
geneVector  a character vector containing entrez IDs
lib  annotation library
GOCat  type of Gene Ontology
level  positive integer to specify how many levels GO IDs will be removed.

Details
User can specify which subtype of GO can be kept. "ALL" means all of subtypes are kept. Gene Ontology is a tree-like structure. Level can be used to remove top noncritical GO IDs.

Value
return a GO list, whose names are GO IDs. Elements are gene entrez IDs belonging to the corresponding GO categories.

Author(s)
Gang Feng, Pan Du and Simon Lin
getHomoGeneIDs

References

Examples
a <- getGOList(c('56458', '16590'), 'org.Mm.eg.db', GOCat='BP', level=2)
length(a)

getHomoGeneIDs | Get homologous genes of given genes

Description
Map given gene IDs to homologous gene IDs.

Usage
getHomoGeneIDs(oriGeneIDs, species = c("human", "rat", "mouse", "yeast", "fly"), speciesL = c("human", "rat", "mouse", "yeast", "fly"), mappingMethod = c("direct", "biomaRt", "none"))

Arguments
oriGeneIDs | a given entrez gene IDs
species | species of the current genes
speciesL | species of the mapped genes
mappingMethod | mapping method, see details

Details
There are two mapping methods supported by current version. "direct" only works between human and mouse because most of human gene symbols are capitalized and only the first letter is uppercase for those homogenes in mouse. Another way is by means of package "biomaRt" ,which contains more information while the network connection is necessary to access biomaRt online server.

Value
return homologous gene IDs of given genes

Author(s)
Gang Feng, Pan Du and Simon Lin

References
 getListGIF

Examples

getHomoGeneIDs(c('56458', '16590'), species='m', speciesL='h', mappingMethod='direct')

description

Function to grab the overrepresented concepts from a list of genes through ListGIF web server.

Usage

ggetListGIF(glist, output=NULL, background=c("white", "black"), type=c("genelevel", "riflevel", "goterm"))

Arguments

glist: a character vector or a list or an one-column data frame giving gene symbols for query
output: a character string specifying the name of the word cloud figure. Default is NULL, in this case the file name is generated by ListGIF web server
background: a character string specifying the background of the word cloud png file to be either "white" or "black". Default is "white"

type: a character string specifying the type of analysis implemented by ListGIF web server: "genelevel", "riflevel" or "goterm". Default is "genelevel"

Details

glist is a character vector of gene symbols in query. If glist is a list or a one-column data frame, it will be converted to a vector. output is the file name of the word cloud graph. If not specified, the original file name generated by ListGIF server is provided. background of the word cloud graph can be either white or black. Default is white. type specifies the word cloud to be either geneGIF, geneRIF or GO terms. geneRIF analysis requires considerable amount of time.

Value

A png file is generated at current working directory if user-specified directory is not provided in the output argument.

Author(s)

Lei Huang

References

Examples

glist <- c("MRPS35", "NBL1", "PSMD14", "PGK1", "SMC4", "SLC16A1", "CAV1")

## Not run: getListGIF(glist=glist, output="tmp2.png", background="black", type="riflevel")
getMultiLayerGraphIDs

retrieve multilayer interacted nodes for given IDs and interaction Matrix

Description
A function to retrieve multilayer interacted nodes for given IDs and interaction Matrix with specified filtered IDs.

Usage
getMultiLayerGraphIDs(graphIDs, idType=c('GO', 'GO.BP', 'GO.CC', 'GO.MF', 'GeneInteraction', 'Customized'), edgeM=NULL, layers=1, filterGraphIDs=NULL, filterLayer=0, UP=TRUE, directed=FALSE, verbose=TRUE)

Arguments
- graphIDs: a character vector for given IDs
- idType: type of IDs, could be one of 'GO', 'GO.BP', 'GO.CC', 'GO.MF', 'GeneInteraction' and 'Customized'
- edgeM: a 2-column Matrix representing a network
- layers: an integer, specify how many layers will be retrieved.
- filterGraphIDs: a character vector for filtered IDs
- filterLayer: an integer, specify where filterGraphIDs are applied.
- UP: logic, determine search Parents or Children. Only valid for directed relation.
- directed: logic, the network is a directed or not
- verbose: logic, specify to show information or not.

Details
Currently, if idType is 'GO', 'GO.BP', 'GO.CC' or 'GO.MF', edgeM will be ignore. edgeM is a 2-column matrix. For directional connection, the direction is from column 1 elements to column 2 elements. For non-directional connection, each connection should be reversely presented twice, one is from column 1 element to column 2 element, while another is from column 2 element to column 1 element. In other words, non-directional connection is considered as two reverse directional connections. filterGraphIDs are applied only at the filterLayer and more outer layers. This means the nodes between the filterLayer layer and the most external layer belong to the filterGraphIDs. The nodes between given graphIDs and the (filterLayer-1) layer are or are not from filterGraphIDs, but those nodes not in filterGraphIDs should be able to be finally connected by given graphIDs and filterGraphIDs.

Value
return a list containing elements to represent a network. The first element is a logic value, TRUE means no more connection between the most external layer nodes and other nodes. The second element is a list of layer-length. If the 1st element is FALSE, the length of 2nd element should be (layers + 1). And starting from the 3rd elements, the remaining elements construct a network.

Author(s)
Gang Feng, Pan Du and Simon Lin
getNextGOIDs

### Description

A function to retrieve parents or children GO IDs for given IDs with specified filtered IDs.

### Usage

```r
getNextGOIDs(GOIDs, GOType=c('GO', 'GO.BP', 'GO.CC', 'GO.MF'), remove=TRUE, filterGOIDs=NULL, UP=TRUE)
```

### Arguments

- **GOIDs**  
  a character GO ID vector

- **GOType**  
  type of GO IDs, 'GO', 'GO.BP', 'GO.CC' and 'GO.MF'

- **remove**  
  logic, remove the empty GOIDs in the return values

- **filterGOIDs**  
  a character vector for filtered GO IDs

- **UP**  
  logic, determine search Parents or Children.

### Details

filterGraphIDs is used to only keep nodes in filterGraphIDs.

### Value

return a GO IDs list representing a network.

### Author(s)

Gang Feng, Pan Du and Simon Lin

### References

### Examples

```r
g getNextGOIDs(c('GO:0050794', 'GO:0034960'))
```
getPATHList

Retrieve KEGG categories containing given genes

Description

Function to retrieve KEGG category IDs containing given genes.

Usage

gETCHGLIST(geneVector, lib)

Arguments

geneVector an Entrez gene IDs vector
lib annotation library to be used to retrieve KEGG IDs.

Details

The current version only supports Bioconductor team maintained annotation libraries, like `org.Bb.eg.db`, `org.Ce.eg.db`, `org.Cf.eg.edu`, `org.Dm.eg.db`, `org.Dr.eg.db`, `org.EcK12.eg.db`, `org.EcSakai.eg.db`, `org.Gg.eg.db`, `org.Hs.eg.db`, `org.Mm.eg.db`, `org.Rn.eg.db` and `org.Ss.eg.db`.

Value

return a KEGG genes ID list, names of the list are KEGG IDs and elements are genes IDs.

Author(s)

Gang Feng, Pan Du and Simon Lin

References

See Also

getCategoryList

Examples

a <- getPATHList(c('56458', '16590'), 'org.Mm.eg.db')
length(a)
getPATHTerms

Get Pathway names of given KEGG IDs

Description

Function to map given KEGG IDs to Pathway names.

Usage

getPATHTerms(pathIDs)

Arguments

pathIDs a KEGG IDs vector

Value

return a KEGG pathway terms of given KEGG IDs.

Author(s)

Gang Feng, Pan Du and Simon Lin

References

See Also

getCategoryTerms

Examples

getPATHTerms(c('04916', '05221'))

getREACTOMEPATHList

Retrieve REACTOME path categories containing given genes

Description

Function to retrieve REACTOME path_db IDs containing given genes.

Usage

getREACTOMEPATHList(geneVector)

Arguments

geneVector an Entrez gene IDs vector
getREACTOMEPATHTerms

Details

geneVector should be a vector of Entrez IDs.

Value

return a REACTOME genes ID list, names of the list are REACTOME path IDs and elements are gene IDs.

Author(s)

Gang Feng, Pan Du and Simon Lin

References

See Also

getCategoryList

Examples

## Not run: a <- getREACTOMEPATHList(c('8772', '1017'))
## Not run: length(a)
getSingleLayerGraphIDs

getSingleLayerGraphIDs
retrieve direct interacted nodes for given IDs and interaction Matrix

Description
A function to retrieve direct interacted nodes for given IDs and interaction Matrix with specified filtered IDs.

Usage
getSingleLayerGraphIDs(graphIDs, edgeM, remove=TRUE, filterGraphIDs=NULL, directed=FALSE, UP=TRUE)

Arguments
graphIDs a character vector for given IDs
edgeM a 2-column Matrix representing connectionship
remove logic, remove the non-connection graphIDs in the return values
filterGraphIDs a character vector for filtered IDs
directed logic, the network is a directed or not
UP logic, determine search Parents or Children. Only valid for directed relation.

Details
degreeM is a 2-column matrix. For directional connection, the direction is from column 1 elements to column 2 elements. For non-directional connection, each connection should be reversely presented twice, one is from column 1 element to column 2 element, while another is from column 2 element to column 1 element. In other words, non-directional connection is considered as two reverse directional connections. filterGraphIDs is used to only keep nodes in filterGraphIDs.

Value
return a list representing a network.

Author(s)
Gang Feng, Pan Du and Simon Lin

References

Examples
## Not run: getREACTOMEPATHTerms(c('174143', '453274'))

---
**getSymbols**

Convert entrez gene IDs to gene symbols

**Description**

function to convert given entrez gene IDs to gene symbols.

**Usage**

getSymbols(geneIDs, data, strict = FALSE, missing=c('name', 'keep', 'remove'))

**Arguments**

- **geneIDs**: an Entrez gene IDs vector
- **data**: annotation library
- **strict**: logic value to stop conversion if NA is introduced.
- **missing**: type of handling NA mapping.

**Value**

return a gene symbols vector of given gene IDs. There are three types of parameters for variable 'missing'. 'name' means the NA mapping values are replaced by their names. 'keep' means all of NA values are kept. 'remove' means all of NA values are removed.

**Author(s)**

Gang Feng, Pan Du and Simon Lin

**References**

**Examples**

```r
require('org.Mm.eg.db')
getSymbols(c('11651', '11836'), 'org.Mm.eg.db')
```
**getTotalGeneNumber**

Obtain the total number of genes in the given annotation library

**Description**

A function to obtain the total number of genes in the given annotation library.

**Usage**

```r

If known is set to TRUE, the enrichment test only considers the genes with annotation. If FALSE, the total number of genes in that species will be returned.

**Value**

A number of total genes.

**Author(s)**

Gang Feng, Pan Du and Simon Lin

**References**

**See Also**

geneAnswersBuilder
Examples

getTotalGeneNumber(categoryType='GO.CC', annotationLib='org.Hs.eg.db')

Description

Function to generate a html format top multigroup Concepts-genes analysis report based on a given GeneAnswers instance list. Currently, this function only works at Mac platform and Java 1.6 or latest version is required.

Usage

groupReport(dataMatrix, gAList, topCat=10, methodOfCluster=c('mds', 'sort'), matrixOfHeatmap=NULL, fileName = "multiConceptsGenes.html", title='Multigroup Genes Concepts Analysis', catType=c('GO', 'KEGG', 'DOLITE', 'REACTOME.PATH', 'CABIO.PATH', 'Unknown'), reverseOfCluster=FALSE, colorValueColumn = NULL, annLib=c('org.Hs.eg.db', 'org.Rn.eg.db', 'org.Mm.eg.db', 'org.Dm.eg.db'), nameLength=94, addID=TRUE, interactive=FALSE, bgColor="#ffffff", keepCytoscapeFiles=TRUE, wordleOn=FALSE, ...)

Arguments

dataMatrix a top concepts-genes matrix generated by getConceptTable.
gAList a GeneAnswers instance list.
topCat number to specify how many top concepts-genes analysis will show.
methodOfCluster cluster method
matrixOfHeatmap NULL or a concepts-genes matrix generated by getConceptTable, which is used to show enrichment test significance for each concept.
clusterTable cluster data to specify which type of values will be used for cluster.
catTerm logic, determine whether mapping category IDs to names
fileName output html file name
title output html title
catType category type, current version supports 'GO', 'KEGG', 'DOLITE', 'REACTOME.PATH', 'CABIO.PATH' and customized annotation libraries, 'Unknown'.
reverseOfCluster logic, whether reverse the cluster order.
colorValueColumn numbers or column names of geneInput slots of the given GeneAnswers instance list to specify the colors of leaves
annLib annotation library names, current version supports 'org.Hs.eg.db', 'org.Rn.eg.db', 'org.Mm.eg.db' and 'org.Dm.eg.db'.
nameLength show how many first letters for long term names, 'all' for full name, default value is 94.
addID logic, add term IDs following term names or not
interactive logic, determine whether network is interactive or not. Interactive network requires java and flash supports.
**Description**

Preprocessed human gene interaction matrix

**Usage**

```r
data(HsIALite)
```
Details

a 4-column matrix containing human interacted genes and evidences

References

Examples

data(HsIALite)
HsIALite[1:4,]

humanExpr  Example human expression data

Description

An example data of human expression

Usage

data(humanExpr)

Format

A data frame with 86 observations on the 6 variables.

Details

This date frame is a part of expression profile from a human Illumina array experiment.

References

Examples

data(humanExpr)
humanExpr[1:10,]
humanGeneInput  

*Example human gene data*

**Description**
An example of a group of human gene data.

**Usage**
```
data(humanGeneInput)
```

**Format**
A data frame with 86 observations. Column names are "Symbol", "foldChange" and "pValue". Row names are gene Entrez IDs. For general usage, row names of geneInput could be anything.

**Details**
Fold change could be negative, which means the ratio of treatment to control is less than 1 and the value is reciprocal of general fold change.

**References**

**Examples**
```
data(humanGeneInput)
humanGeneInput[1:10,]
```

MmIALite  

*Mouse gene interaction matrix*

**Description**
Preprocessed mouse gene interaction matrix

**Usage**
```
data(MmIALite)
```

**Details**
a 4-column matrix containing mouse interacted genes and evidences

data(sampleGroupsData)

head(sampleGroupsData)

---

searchEntrez  

**Search specified information from Entrez site**

**Description**

A function to search Entrez website by one given keywords list.

**Usage**

searchEntrez(tagList, species = "human")

**Arguments**

- **tagList**: keyword list to search on Entrez.
- **species**: specie for search on Entrez.

**Value**

an Entrez ID list containing all of relative genes from Entrez database.
**Author(s)**

Pan Du, Gang Feng and Simon Lin

**References**

**Examples**

```r
taglist <- list(FSHR=c('FSHR', 'Follicle stimulating hormone receptor'), apoptosis=c('apoptosis'))
## Not run: entrezList <- searchEntrez(tagList, species='mouse')
```

**topcaBIO.PATH**

*Present top CABIO.PATH enrichment test information*

**Description**

Function to present top CABIO.PATH enrichmentInfo of given GeneAnswers instance. This function is not supported starting this version due to the termination of the caBig project.

**Usage**

`topcaBIO.PATH(x, catTerm = TRUE, keepID=TRUE, ...)`

**Arguments**

- `x` a given GeneAnswers instance containing CABIO.PATH information
- `catTerm` logic value to determine whether mapping to CABIO.PATH terms or not
- `keepID` logic value to determine whether showing CABIO.PATH IDs or not
- `...` other parameters to transfer to topCategory

**Value**

print necessary information on the screen and save into a specified file if request.

**Author(s)**

Gang Feng, Pan Du and Simon Lin

**References**

**See Also**

`topCategory`

**Examples**

```r
# x is a GeneAnswers instance with CABIO.PATH test
## Not run: topcaBIO.PATH(x, top=10)
```
**Description**

Function to present top CABIO.PATH enrichment information with given GeneAnswers instance with genes. This function is not supported starting this version due to the termination of the caBig project.

**Usage**

topcaBIO.PATHGenes(x, catTerm = TRUE, keepID=TRUE, geneSymbol = TRUE, ...)

**Arguments**

- **x**: a given GeneAnswers instance with CABIO.PATH test
- **catTerm**: logic value to determine whether mapping CABIO.PATH IDs to CABIO.PATH terms
- **keepID**: logic; to determine whether keep CABIO.PATH IDs
- **geneSymbol**: logic value to determine whether mapping gene Entrez IDs to gene symbols
- **...**: other parameters to transfer to topCategoryGenes

**Details**

See function topCategoryGenes help for details

**Value**

print necessary information on the screen and save into a specified file if request.

**Author(s)**

Gang Feng, Pan Du and Simon Lin

**References**

**See Also**

topCategoryGenes

**Examples**

```r
##x is a GeneAnswers instance with CABIO.PATH test
## Not run: topcaBIO.PATHGenes(x, geneSymbol=TRUE, orderby='pvalue', top=10, topGenes='ALL', genesOrderBy='pValue')
```
topCategory

Present top enrichment test information

Description
Function to present top enrichmentInfo of given GeneAnswers instance.

Usage
topCategory(inputX, orderby = c("geneNum", "pvalue", "foldChange", "oddsRatio", "correctedPvalue"), top = 5, file = FALSE, fileName = "topCategory.txt")

Arguments
inputX a given GeneAnswers instance
orderby type to sort enrichmentInfo slot
top integer to specify how many top rows to be presented
file logic value to determine whether save to a file
fileName string to specify file name, default file name is topCategory.txt

Details
orderby could be one of 'geneNum', 'pvalue', 'foldChange', 'oddsRatio' and 'correctedPvalue'. top could be an integer or 'ALL'. The top former specified categories will be printed on screen while only 30 categories will be displayed for 'ALL'. All categories can be saved in a specified file.

Value
print necessary information on the screen and save into a specified file if request.

Author(s)
Gang Feng, Pan Du and Simon Lin

References

Examples
# x is a GeneAnswers instance
## Not run: topCategory(x, orderby='pvalue')
Description

Function to present top enrichmentInfo of given GeneAnswers instance with genes.

Usage

topCategoryGenes(inputX, orderby = c("geneNum", "pvalue", "foldChange", "oddsRatio", "correctedPvalue"), top = 5, genesOrderBy = 1, decreasing = FALSE, topGenes = 5, file = FALSE, fileName = "topCategoryGenes.txt")

Arguments

inputX a given GeneAnswers instance
orderby type to sort enrichmentInfo slot
top integer to specify how many top rows to be presented
genesOrderBy integer or characters to specify gene ordered column.
decreasing logic value to specify gene order is descending or not
topGenes integer to specify how many top genes to be presented
file logic value to determine whether save to a file
fileName string to specify file name, default file name is topCategoryGenes.txt

Details

orderby could be one of 'geneNum', 'pvalue', 'foldChange', 'oddsRatio' and 'correctedPvalue'.
top could be an integer or 'ALL'. The top former specified categories will be printed on screen
while only 30 categories will be displayed for 'ALL'. All categories can be saved in a specified file.
topGenes is similar to top, but only top 5 genes will be displayed for 'ALL'. genesOrderBy could
be an integer to specify column to be sorted. It can also be the column name. If set to 'none', no
sorting for genes.

Value

print necessary information on the screen and save into a specified file if request.

topDOLITE  

Present top DOLITE enrichment test information

Description

Function to present top DOLITE enrichment info of given GeneAnswers instance.

Usage

topDOLITE(x, catTerm = TRUE, keepID=TRUE, ...)

Arguments

x  
a given GeneAnswers instance containing DOLITE information

catTerm  
logic value to determine whether mapping to DOLITE terms or not

keepID  
logic value to determine whether showing IDs or not

...  
other parameters to transfer to topCategory

Value

print necessary information on the screen and save into a specified file if request.

Examples

# x is a GeneAnswers instance with DOLITE test
## Not run: topDOLITE(x, top=10)
topDOLITEGenes

Present top DOLITE enrichment test information with genes

Description

Function to present top DOLITE enrichmentInfo of given GeneAnswers instance with genes.

Usage

topDOLITEGenes(x, catTerm = TRUE, keepID=TRUE, geneSymbol = TRUE, ...)

Arguments

- `x`: a given GeneAnswers instance with DOLITE test
- `catTerm`: logic value to determine whether mapping DOLITE IDs to DOLITE terms
- `keepID`: logic, to determine whether keep DOLITE IDs
- `geneSymbol`: logic value to determine whether mapping gene Entrez IDs to gene symbols
- `...`: other parameters to transfer to topCategoryGenes

Details

See function topCategoryGenes help for details

Value

print necessary information on the screen and save into a specified file if request.

```
topGO

Present top GO enrichment test information

Description

Function to present top GO enrichmentInfo of given GeneAnswers instance.

Usage

topGO(x, catTerm = TRUE, keepID = TRUE, ...)

Arguments

x               a given GeneAnswers instance containing GO test information
catTerm         logic value to determine whether mapping to GO terms or not
keepID          logic value to determine whether showing IDs or not
...             other parameters to transfer to topCategory

Value

print necessary information on the screen and save into a specified file if request.
