Package ‘MAST’

January 14, 2017

**Type**  Package

**Title**  Model-based Analysis of Single Cell Transcriptomics

**Version**  1.0.5

**Date**  2016-11-04

**Author**  Andrew McDavid &lt;Andrew_McDavid@urmc.rochester.edu&gt;, Greg Finak &lt;gfinak@fredhutch.org&gt;, Masanao Yajima &lt;myajima@fredhutch.org&gt;

**Maintainer**  Andrew McDavid &lt;Andrew_McDavid@urmc.rochester.edu&gt;

**VignetteBuilder**  knitr

**Imports**  Biobase, BiocGenerics, S4Vectors, data.table, ggplot2, plyr, stringr, abind, methods, parallel, reshape2, stats, stats4, graphics, utils

**Depends**  SummarizedExperiment, R(>= 3.3)

**Suggests**  knitr, rmarkdown, testthat, lme4(>= 1.0), roxygen2(> 4.0.0), numDeriv, car, gdata, lattice, GGally, GSEABase, NMF, TxDb.Hsapiens.UCSC.hg19.knownGene, rsvd, limma, RColorBrewer

**Description**  Methods and models for handling zero-inflated single cell assay data.

**License**  GPL(>= 2)

**RoxygenNote**  5.0.1

**LazyData**  true

**biocViews**  GeneExpression, DifferentialExpression, GeneSetEnrichment, RNASeq, Transcriptomics, SingleCell

**BugReports**  https://github.com/RGLab/MAST/issues

**URL**  https://github.com/RGLab/MAST/

**NeedsCompilation**  no

MAST-package

Description

Methods for analysing single cell assay data using hurdle models.

Details

This package provides data structures and functions for statistical analysis of single-cell assay data such as Fluidigm single cell gene expression assays.

References

applyFlat

Apply a vectorized binary operation recycling over last dimension

Description
When x is an array of order K, and y is an array of order K-1, whose dimensions otherwise agree, apply FUN by recycling y as necessary over dimension K of x.

Usage
applyFlat(x, y, FUN = "-")

Arguments
x array, order K
y array, order K-1
FUN vectorized binary operation

Value
array, order K equal to FUN(x,y)

Examples
## Dumb example, could be done with scale(..., scale=FALSE)
x0 = matrix(1:10, nrow=2)
y0 = rowMeans(x0)
dim(y0) = c(1, 2)
x1 = MAST:::applyFlat(x0, y0)
stopifnot(rowMeans(x1)==0)

BayesGLMlike-class

Wrapper for bayesian GLM

Description
Wrapper for bayesian GLM

Slots
prior numeric optional 3d array used to specify prior for coefficients
useContinuousBayes logical should bayesglm be used to fit the continuous component as well?
**bootVcov1**

*Bootstrap a zlmfit*

**Description**

Sample cells with replacement to find bootstrapped distribution of coefficients

**Usage**

```r
bootVcov1(zlmfit, R = 99)
```

**Arguments**

- `zlmfit`: class ZlmFit
- `R`: number of bootstrap replicates

**Value**

array of bootstrapped coefficients

**Examples**

```r
data(vbetaFA)
zlmVbeta <- zlm.SingleCellAssay(~ Stim.Condition, subset(vbetaFA, ncells==1)[1:5,])
#Only run 3 boot straps, which you wouldn't ever want to do in practice...
bootVcov1(zlmVbeta, R=3)
```

---

**calcZ**

*Get Z or T statistics and P values after running gseaAfterBoot*

**Description**

The Z or T statistics may be reported by component (discrete/continuous) when combined='no' or combined by Fisher's or Stouffer's method (combined='fisher' or combined='stouffer'). Fisher's method uses the product of the p-values, while Stouffer's method uses the sum of the Z/T scores. The "Z" score returned by Fisher is the normal quantile that would yield the observed Fisher P-value, whose sign is derived from the sign of the maximum component Z score. The "Z" score returned by Stouffer when testType='normal' is the sum of the Z scores, over sqrt(2). When testType='t' it is a weighted combination of the Z scores, with weights corresponding to the degrees of freedom in each of the t statistics. A t-approximation to this sum of t-variables is derived by matching moments. It seems to be fairly accurate in practice.

**Usage**

```r
calcZ(gseaObj, testType = "t", combined = "none")
```
Arguments

gseaObj output from \texttt{gseaAfterBoot}

testType either 'normal' or 't'. The 't' test adjusts for excess kurtosis due to the finite number of bootstrap replicates used to estimate the variance of the statistics. This will result in more conservative inference.

combined character one of 'none', 'fisher' or 'stouffer'

Value

3D array with dimensions set (modules) comp ('continuous or 'discrete) and metric ('Z' stat and two sided 'P' value that $P(|Z|)$ if combined='no', otherwise just a matrix.

See Also

\texttt{gseaAfterBoot}

Examples

## See the examples in \texttt{gseaAfterBoot}
\texttt{example(gseaAfterBoot)}

---

cData Deprecated cell/feature data accessors/mutators

Description

These functions are now all deprecated and will be removed in a future release.

Usage

cData(sc)

cData(sc) <- value

## S4 method for signature 'SingleCellAssay'
cData(sc)

## S4 replacement method for signature 'SingleCellAssay'
cData(sc) <- value

## S4 method for signature 'SingleCellAssay,SingleCellAssay'
combine(x, y, ...)

## S4 method for signature 'SingleCellAssay,ANY'
combine(x, y, ...)

Arguments

- **sc**: An object with cellData
- **value**: replacement value
- **x**: SingleCellAssay
- **y**: SingleCellAssay
- **...**: SingleCellAssay

Details

```
cData(sc): Return the cellData data.frame.
cData(sc)<-value: Replace the cellData with value, which can be either an AnnotatedDataFrame or data.frame. The replacement is checked that it has mandatory fields defined by its class.
combine(x, y, ...): Concatenate two experiments along rows/columns
```

Value

DataFrame or modifies the SingleCellAssay object in place

Replacement Functions

You should transition to use the following replacements:

```
cData  colData
fData  mcols
exprs  assay
combine  cbind2 or rbind2
```

See Also

exprs

Examples

```
data(vbetaFA)
stopifnot(all.equal(hushWarning(cData(vbetaFA), 'deprecated'), colData(vbetaFA)))
stopifnot(all.equal(hushWarning(fData(vbetaFA), 'deprecated'), mcols(vbetaFA)))
stopifnot(all.equal(hushWarning(exprs(vbetaFA), 'deprecated'), t(assay(vbetaFA))))
```

Description

Replace colData with a DataFrame. Checks to make sure that row.names(value) match colnames(x), in contrast to the parent method. Checks for a wellKey column, as well.
collectResiduals

Usage

```r
## S4 replacement method for signature 'SingleCellAssay,DataFrame'
colData(x) <- value
```

Arguments

- `x` SingleCellAssay
- `value` DataFrame

Value

modified SingleCellAssay

collectResiduals  

Residual hooks and collection methods

Description

After each gene is fit, a hook function can optionally be run and the output saved. This allows extended computations to be done using the fitted model, without keeping it in memory. Here this is used to calculate various residuals, though in some cases they can be done using only the information contained in the ZlmFit-class.

Usage

```r
collectResiduals(x, sca, newLayerName = "Residuals")
```

- `discrete_residuals_hook(x)`
- `continuous_residuals_hook(x)`
- `combined_residuals_hook(x)`
- `deviance_residuals_hook(x)`
- `fitted_phat(x)`
- `partialScore(x, effectRegex)`

Arguments

- `x` ZlmFit-class
- `sca` SingleCellAssay object to which the residuals should be added
- `newLayerName` character name of the assay layer
- `effectRegex` a regular expression naming columns of the design corresponding to $Z_0$. Generally these should be the treatment effects of interest.

Value

copy of sca with new layer
## Functions

- **discrete_residuals_hook**: Hook to get the discrete residuals, i.e., difference between expected probability of expression and observed.
- **continuous_residuals_hook**: Hook to get the continuous residuals, i.e., residuals for conditionally positive observations. If an observation is zero, its residual is defined to be zero as well.
- **combined_residuals_hook**: Hook to get the combined residuals, i.e., $Y - E(U)E(V)$.
- **deviance_residuals_hook**: Standardized deviance residuals hook. Computes the sum of the standardized deviance residuals for the discrete and continuous models (scaled to have unit variance). If the observation is zero then only the discrete component is used.
- **fitted_phat**: Hook to return $p_{hat}$, the predicted probability of expression.
- **partialScore**: Compute $Y_i - E(V_i|X_i, Z_0)E(U|X_i, Z_0)$, where $Z_0$ is a treatment effect (being left in) and $X_i$ is a nuisance effect (being regressed out).

## Total residual types

Each component of the model contributes several flavors of residual, which can be combined in various fashions. The discrete residual can be on the response scale (thus subtracting the predicted probability of expression from the 0/1 expression value). Or it can be a deviance residual, revealing something about the log-likelihood.

## Partial residuals

It’s also possible to consider partial residuals, in which the contribution of a particular covariate is added back into the model.

## See Also

`zlm.SingleCellAssay`

## Examples

```r
data(vbetaFA)
svbeta <- subset(vbetaFA, ncells==1)
svbeta <- svbeta[freq(svbeta)>0.4,]
window <- function(x1) lapply(assays(x1), function(x2) x2[1:3, 1:6])
# total residuals of the response
z1 <- zlm.SingleCellAssay(~ Stim.Condition, svbeta, hook=discrete_residuals_hook)
window(collectResiduals(z1, svbeta))
z2 <- zlm.SingleCellAssay(~ Stim.Condition, svbeta, hook=continuous_residuals_hook)
window(collectResiduals(z2, svbeta))
z3 <- zlm.SingleCellAssay(~ Stim.Condition, svbeta, hook=combined_residuals_hook)
window(collectResiduals(z3, svbeta))
# total deviance residuals
z4 <- zlm.SingleCellAssay(~ Stim.Condition, svbeta, hook=deviance_residuals_hook)
window(collectResiduals(z4, svbeta))
# partial residuals
colData(svbeta)$ngeneson <- colMeans(assay(svbeta)>0)
z5 <- zlm.SingleCellAssay(~ Stim.Condition + ngeneson, svbeta)
partialScore(z5, 'Stim.Condition')
```
**computeEtFromCt**  
*Compute the Et from the Ct*

**Description**

Computes the Et value from the Ct value in an existing data frame and returns a new data frame with the Et column appended.

**Usage**

```r
computeEtFromCt(df, column = "Ct", Cmax = 40)
```

**Arguments**

- `df`: a `data.frame`
- `column`: The name of the Ct column. A character. 'Ct' by default.
- `Cmax`: the maximum number of cycles performed. 40 by default.

**Value**

A copy of `df` with the 'Et' column appended.

**Author(s)**

Greg Finak

**Examples**

```r
data(vbeta)
vbeta <- computeEtFromCt(vbeta)
```

---

**condmean**  
*Report the mean et value for each gene*

**Description**

NAs are always removed.

**Usage**

```r
condmean(sc)
```

**Arguments**

- `sc`: `SingleCellAssay`

**Value**

vector of means
**condSd**

Examples

```r
data(vbetaFA)
condmean(vbetaFA)
```

<table>
<thead>
<tr>
<th><strong>condSd</strong></th>
<th><em>Report standard deviation of et, for positive et for each gene</em></th>
</tr>
</thead>
</table>

Description

NAs are always removed

Usage

```r
condSd(sc)
```

Arguments

- `sc` SingleCellAssay

Value

vector of standard deviations

---

**convertMASTClassicToSingleCellAssay**

*Convert a MASTClassic SingleCellAssay*

Description

Convert a SingleCellAssay object created with the MASTClassic package to an object recognized by the new MAST package

Usage

```r
convertMASTClassicToSingleCellAssay(object = NULL)
```

Arguments

- `object` of class SingleCellAssay created by MASTClassic

Details

The function will extract the relevant information from the attributes of the old object and construct a new SingleCellAssay that is recognized by MAST. This function checks that the object is a MASTClassic SingleCellAssay object. It will stop if it is not a SingleCellAssay, return a converted SingleCellAssay if object was created by MASTClassic, and return the original object if the object is already compatible.

Value

A MAST SingleCellAssay object.
Note
Type checking for old object is not performed.

Examples

data(vbetaFA)
convertMASTClassicToSingleCellAssay(vbetaFA)

defaultPrior

Description
Initialize a prior to be used a prior for BayeGLMlike/BayesGLMlike2

Usage
defaultPrior(names)

Arguments
names character vector of coefficients. The ‘(Intercept)’ will be ignored.

Value
3d array, with leading dimension giving the prior ‘loc’ation, ‘scale’ and degrees of freedom (df),
second dimension giving the component (‘C’ontinuous or ‘D’iscrete) and trailing dimension giving
the coefficient to which the prior applies. The location is initialized to be 0, the scale to 2, and
degrees of freedom of 1, following the default of bayesglm.

Examples
dp <- defaultPrior(quote('Stim.ConditionUnstim'))
## Not run:
data(vbetaFA)
zlmVbeta <- zlm.SingleCellAssay(~ Stim.Condition, vbeta.sc, method='bayesglm', coefPrior=dp)
## End(Not run)

dof

Description
Degrees of freedom of Zero inflated model

Usage
dof(object)
**Drop**

**Arguments**

object : LMlike or subclass

**Value**

vector giving the model degrees of freedom for continuous and discrete

---

**Description**

Like drop(x) but only dropping specified dimensions. There is no testing that the specified dimensions are actually singletons.

**Usage**

Drop(x, d)

**Arguments**

x : array of at least d dimensions
d : dimension(s) to drop

**Value**

array x

**Examples**

x = array(1:4, dim=c(1, 2, 1, 2))
dx = MAST:::Drop(x, 1)
stopifnot(all(dim(dx)==c(2,1,2)))

ebayes : Estimate hyperparameters for hierarchical variance model for continuous component

**Description**

ebayesControl is a named list with (optional) components 'method' (one of 'MOM' or 'MLE') and 'model' (one of 'H0' or 'H1') method MOM uses a method-of-moments estimator, while MLE using the marginal likelihood. H0 model estimates the precisions using the intercept alone in each gene, while H1 fits the full model specified by formula

**Usage**

ebayes(sca, bayesControl, Formula, truncate = Inf)
expavg

Arguments

sca SingleCellAssay

ebayesControl list with (optional) components 'method', 'model'. See details.

Formula a formula (using variables in colData(sca) used when model='H1'.

truncate Genes with sample precisions exceeding this value are discarded when estimating the hyper parameters

Value

numeric of length two, giving the hyperparameters in terms of a variance (ν) and prior observations (df), inside a structure, with component hess, giving the Fisher Information of the hyperparameters.

Description

Puts log transformed values onto natural scale and takes mean of vector. Calculates mean(2^x - 1)

Usage

expavg(x)

Arguments

x numeric

Value

numeric

Examples

x <- 1:10
logmean(expavg(x))
**fData**

**Description**

Accessor for featureData data.frame

**Arguments**

- **object**: An object with featureData

**Details**

Returns the featureData data.frame.

**Value**

- data.frame

---

**featureData**

**Accessors for featureData**

**Description**

Returns the featureData.

**Arguments**

- **object**: An object with featureData

**Value**

- AnnotatedDataFrame

---

**filter**

*Filter a SingleCellAssay*

**Description**

Remove, or flag wells that are outliers in discrete or continuous space.

**Usage**

```r
filter(sc, groups = NULL, filt_control = NULL, apply_filter = TRUE)

burdenOfFiltering(sc, groups, byGroup = FALSE, filt_control = NULL)
```
Arguments

sc  The SingleCellAssay object

groups  An optional character naming the grouping variable

filt_control  The list with configuration parameters for the filter.

apply_filter  logical should the filter be applied, or should a matrix of booleans giving if a well would be subject to a filtering criteria be returned?

byGroup  in the case of burdenOffiltering should the filter be stratified by groups, or only the plotting.

Details

The function filters wells that don’t pass filtering criteria described in filt_control. filt_control is a list with named elements nOutlier (minimum number of outlier cells for a cell to be filtered [default = 2]) sigmaContinuous (the z-score outlier threshold for the continuous part of the signal) [default = 7] and sigmaProportion (the z-score outlier threshold for the discrete part of the signal) [default = 7].

If groups is provided, the filtering is calculated within each level of the group, then combined again as output.

Value

A filtered result

Functions

• burdenOffiltering: plot the proportions of wells are filtered due to different criteria

Author(s)

Andrew McDavid

See Also

burdenOffiltering

Examples

data(vbetaFA)
## Split by 'ncells', apply to each component, then recombine
vbeta.filtered <- filter(vbetaFA, groups='ncells')
## Returned as boolean matrix
was.filtered <- filter(vbetaFA, apply_filter=FALSE)
## Wells filtered for being discrete outliers
head(subset(was.filtered, pctout))
burdenOffiltering(vbetaFA, groups='ncells', byGroup=TRUE)
burdenOffiltering(vbetaFA, groups='ncells')
filterLowExpressedGenes

Filter low-expressing genes

Description
Filter out genes that have less than some percent threshold expression across all libraries

Usage
filterLowExpressedGenes(assay, threshold = 0.1)

Arguments
- **assay**: a SingleCellAssay object
- **threshold**: a numeric between 0, and 1, specifying the threshold frequency below which genes will be filtered out

Value
SingleCellAssay

Examples
```r
data(vbetaFA)
filterLowExpressedGenes(vbetaFA)
```

fit

fit a zero-inflated regression

Description
Given a design and formula, fit the zero inflated regression, storing the fits in slots `fitC` and `fitD`

Usage
fit(object, response, ...)

## S4 method for signature 'LMERlike,missing'
fit(object, response, silent = TRUE, ...)

Arguments
- **object**: inheriting from LMlike
- **response**: a vector, same length as the design, or if missing then use the current response
- ... currently ignored
- **silent**: mute some warnings emitted from the underlying modeling functions

Value
LMlike or subclass
freq  
Report the proportion of expression for each gene

Description
NAs can be optionally removed

Usage
freq(sc, na.rm = TRUE)

Arguments
- sc SingleCellAssay
- na.rm should NAs be removed, or carried through?

Value
vector of proportions

Examples
data(vbetaFA)
freq(vbetaFA)

FromFlatDF
Construct a SingleCellAssay (or derived subclass) from a ‘flat’
(melted) data.frame/data.table

Description
SingleCellAssay are a generic container for such data and are simple wrappers around Summa-
rizedExperiment objects. Subclasses exist that embue the container with additional attributes, eg
FluidigmAssay.

Usage
FromFlatDF(dataframe, idvars, primerid, measurement, id = numeric(0),
cellvars = NULL, featurevars = NULL, phenovars = NULL,
class = "SingleCellAssay", ...)
FluidigmAssay(...)
**FromMatrix**

Construct a SingleCellAssay from a matrix or array of expression

**Description**

If the gene expression measurements are already in a rectangular form, then this function allows an easy way to construct a SingleCellAssay object while still doing some sanity checking of inputs.

**Usage**

```r
FromMatrix(exprsArray, cData, fData, class = "SingleCellAssay")
```

**Arguments**

- `dataframe` A `flattened` `data.frame` or `data.table` containing columns giving cell and feature identifiers and a measurement column
- `idvars` character vector naming columns that uniquely identify a cell
- `primerid` character vector of length 1 that names the column that identifies what feature (i.e. gene) was measured
- `measurement` character vector of length 1 that names the column containing the measurement
- `id` An identifier (e.g., experiment name) for the resulting object
- `cellvars` Character vector naming columns containing additional cellular metadata
- `featurevars` Character vector naming columns containing additional feature metadata
- `phenovars` Character vector naming columns containing additional phenotype metadata
- `class` character providing desired subclass to construct.
- ... additional arguments are ignored

**Value**

SingleCellAssay, or derived, object

**Examples**

```r
data(vbeta)
colnames(vbeta)
vbeta <- computeEtFromCt(vbeta)
vbeta.fa <- FromFlatDF(vbeta, idvars=c("Subject.ID", "Chip.Number", "Well"),
primeid="Gene", measurement="Et", ncells="Number.of.Cells",
geneid="Gene", cellvars=c("Number.of.Cells", 'Population'),
phenovars=c('Stim.Condition', 'Time'), id='vbta all', class='FluidigmAssay')
show(vbeta.fa)
nrow(vbeta.fa)
ncol(vbeta.fa)
head(mcols(vbeta.fa)$primerid)
table(colData(vbeta.fa)$Subject.ID)
vbeta.sub <- subset(vbeta.fa, Subject.ID=='Sub01')
show(vbeta.sub)
```
getConcordance

Arguments

exprsArray matrix or array, columns are cells, rows are genes
cData cellData an object that can be coerced to a DataFrame, i.e., data.frame, AnnotatedDataFrame. Must have as many rows as ncol(exprsArray)
fData featureData an object that can be coerced to a DataFrame, i.e., data.frame, AnnotatedDataFrame. Must have as many rows as nrow(exprsArray).
class desired subclass of object. Default SingleCellAssay.

Value

an object of class class

Examples

ncells <- 10
genomes <- 5
fData <- data.frame(primerid=LETTERS[1:ngenomes])
cData <- data.frame(wellKey=seq_len(ncells))
mat <- matrix(rnorm(ncells*ngenomes), nrow=ngenomes)
sca <- FromMatrix(mat, cData, fData)
stopifnot(inherits(sca, 'SingleCellAssay'))
stopifnot(inherits(sca, 'SummarizedExperiment'))

## If there are mandatory keywords expected by a class, you'll have to manually set them yourself
cData$ncells <- 1
fd <- FromMatrix(mat, cData, fData)
stopifnot(inherits(fd, 'SingleCellAssay'))

getConcordance

Description

Get the concordance between two

Usage

getConcordance(singleCellRef, singleCellcomp, groups = NULL,
   fun.natural = expavg, fun.cycle = logmean)

gtwss(concord, nexp)

gtss(concord)

gtrc(concord)

Arguments

singleCellRef "reference" SingleCellAssay
singleCellcomp "comparison" SingleCellAssay
groups character vector giving variable(s) on which the comparison is conditioned
fun.natural function to transform the SingleCellAssays to a mRNA proportional level
fun.cycle inverse function of fun.natural
concord data.frame returned by getConcordance
nexp number of expressed cells per row in concord

Details
Return the concordance between two assays (i.e. single cell and hundred cell) The "average" of singleCellRef (after adjusting for the number of cells) and singleCellComp are taken per gene, per groups. A data.frame with one row per gene-groups is returned with some additional columns.

Value
concordance between two assays

Functions
• getwss: getr the sum of squares, weighted by nexp
• getss: return the sum of squares
• getrc: Return Lin's (1989) concordance correlation coefficient

Author(s)
Andrew McDavid

See Also
plotSCAConcordance

Examples
data(vbetaFA)
sca1 <- subset(vbetaFA, ncells==1)
sca100 <- subset(vbetaFA, ncells==100)
concord <- getConcordance(sca1, sca100)
getss(concord)
getrc(concord)

getwellKey

Accessor for wellKey

Description
This returns the wellKey, which is a unique identifier generated by idvars in the mapping

Usage
getwellKey(sc)
GLMlike-class

Arguments

sc  An object with a wellKey

Value

integer giving the unique id generated

Examples

data(vbetaFA)
getwellKey(vbetaFA)
colData(vbetaFA)$wellKey

GLMlike-class  Wrapper for regular glm/lm

Description

Wrapper for regular glm/lm

Usage

## S4 method for signature 'GLMlike'
vcov(object, which, ...)

Arguments

object  GLMlike
which  character, one of 'C', 'D'.
...  ignored

Value

covariance matrix

Methods (by generic)

• vcov: return the variance/covariance of component which

Slots

weightFun  function to map expression values to probabilities of expression. Currently unused.
Gene set analysis for hurdle model

Description

Modules defined in sets are tested for average differences in expression from the "average" gene. By using bootstraps, the between-gene covariance of terms in the hurdle model is found, and is used to adjust for coexpression between genes. We drop genes if the coefficient we are testing was not estimable in original model fit in zFit or in any of the bootstrap replicates (evidenced an NA in the bootstrap array). This might yield overly conservative inference. Since bootstrapping is a randomized procedure, the degrees of freedom of a module (and its variance parameters) might differ from run-to-run. You might try setting var_estimate='modelbased' to relax this requirement by assuming independence between genes and then using the asymptotic covariance estimates, which are deterministic, but may result in overly-generous inference.

Usage

```r
gseaAfterBoot(zFit, boots, sets, hypothesis, control = list(n_randomize = Inf, var_estimate = "bootall"))
```

Arguments

- `zFit`: object of class ZlmFit
- `boots`: bootstraps of zFit
- `sets`: list of indices of genes
- `hypothesis`: a `Hypothesis` to test. Currently only one degree `CoefficientHypothesis` are supported.
- `control`: list of control parameters. See details.

Value

Object of class GSEATests, containing slots `tests`, 4D array and `bootR`, the number of bootstrap replicates.

control

ccontrol is a list with elements:

- `n_randomize`, giving the number of genes to sample to approximate the non-module average expression. Set to Inf to turn off the approximation (the default).
- `var_estimate`, giving the method used to estimate the variance of the modules. bootall uses the bootstrapped covariance matrices. bootdiag uses only the diagonal of the bootstrapped covariance matrix (so assuming independence across genes). modelbased assumes independence across genes and uses the variance estimated from the model.

Return Value

A 4D array is returned, with dimensions "set" (each module), "comp" (\'disc\'rete or \'cont\'inuous), "metric" (\'stat\' gives the average of the coefficient, \'var\' gives the variance of that average, \'dof\' gives the number of genes that were actually tested in the set), "group" (\'test\' for the genes in test-set, "null" for all genes outside the test-set).

GSEATests-class

An S4 class for Gene Set Enrichment output

Description

This holds output from a call to gseaAfterBoot. It primarily provides a summary method.

Slots

tests array: gene sets X discrete, continuous X stat, variance, degrees of freedom, avg correlation X test, null
bootR number of bootstrap replicates

See Also

gseaAfterBoot
calcZ
summary.GSEATests-method

hushWarning

Selectively muffle warnings based on output

Description

Selectively muffle warnings based on output

Usage

hushWarning(expr, regexp)
**Hypothesis**

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expr</td>
<td>an expression</td>
</tr>
<tr>
<td>regexp</td>
<td>a regexp to be matched (with str_detect)</td>
</tr>
</tbody>
</table>

**Value**

the result of expr

**Examples**

```r
hushWarning(warning('Beware the rabbit'), 'rabbit')
hushWarning(warning('Beware the rabbit'), 'hedgehog')
```

---

**Description**

A Hypothesis can be any linear combination of coefficients, compared to zero. Specify it as a character vector that can be parsed to yield the desired equalities ala makeContrasts. A CoefficientHypothesis is a hypothesis for which terms are singly or jointly tested to be zero (generally the case in a t-test or F-test), by dropping coefficients from the model.

**Usage**

```r
Hypothesis(hypothesis, terms)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hypothesis</td>
<td>a character vector specifying a hypothesis, following makeContrasts, or a character vector naming coefficients to be dropped.</td>
</tr>
<tr>
<td>terms</td>
<td>an optional character vector giving the terms (column names from the model.matrix) out of which the contrasts will be contrasted. If missing then most functions will attempt to fill this in for you at run time.</td>
</tr>
</tbody>
</table>

**Value**

a Hypothesis with a "transformed" component

**See Also**

zlm.SingleCellAssay waldTest lrTest

**Examples**

```r
h <- Hypothesis('Stim.ConditionUnstim', c('(Intercept)', 'Stim.ConditionUnstim'))
h@contrastMatrix
```
impute  
impute missing continuous expression for plotting

Description

If there are no positive observations for a contrast, it is generally not estimable. However, for the purposes of testing we can replace it with the least favorable value with respect to the contrasts that are defined.

Usage

impute(object, groupby)

Arguments

object  
Output of predict

groupby  
Variables (column names in predict) to group by for imputation (facets of the plot)

Value

data.table

Examples

##See stat_ell
example(stat_ell)

influence.bayesglm  
Influence bayesglm object

Description

The influence function

Usage

## S3 method for class 'bayesglm'
influence(model, do.coef = TRUE, ...)

Arguments

model  
bayesglm

do.coef  
see influence.glm

...  
ignored

Value

see influence.glm
invlogit

Inversion of logistic transformation

**Description**
Inverse of logistic transformation

**Usage**
invlogit(x)

**Arguments**
x numeric

**Value**
numeric

**Examples**
```r
x <- 1:5
invlogit(log(x/(1-x)))
```

---

LMERlike-class

Wrapper for lmer/glmer

**Description**
A horrendous hack is employed in order to do arbitrary likelihood ratio tests: the model matrix is built, the names possibly mangled, then fed in as a symbolic formula to glmer/lmer. This is necessary because there is no (easy) way to specify an arbitrary fixed-effect model matrix in glmer.

**Usage**
```r
## S4 method for signature 'LMERlike'
update(object, formula, design, ...)

## S4 method for signature 'LMERlike'
vcov(object, which, ...)

## S4 method for signature 'LMERlike'
coef(object, which, singular = TRUE, ...)

## S4 method for signature 'LMERlike'
logLik(object)
```
Arguments

object LMERlike
formula. formula
design something coercible to a data.frame
... In the case of vcov, ignored. In the case of update, passed to model.matrix.
which character, one of 'C', 'D'.
singular logical. Should NA coefficients be returned?

Value

see the section "Methods (by generic)"

Methods (by generic)

• update: update the formula or design matrix
• vcov: return the variance/covariance of component which
• coef: return the coefficients. The horrendous hack is attempted to be undone.
• logLik: return the log-likelihood

Slots

pseudoMM part of this horrendous hack.
strictConvergence logical return results even when the optimizer or *lmer complains about convergence
optimMsg character record warnings from lme. NA_character_ means no warnings.

LMLike-class

Linear Model-like Class

Description

Wrapper around modeling function to make them behave enough alike that Wald tests and Likelihood ratio are easy to do. To implement a new type of zero-inflated model, extend this class. Depending on how different the method is, you will definitely need to override the fit method, and possibly the model.matrix, model.matrix<-, update, coef, vcov, and logLik methods.

Usage

## S4 method for signature 'LMLike'
summary(object)

## S4 method for signature 'LMLike'
update(object, formula., design, ...)

## S4 method for signature 'LMLike,CoefficientHypothesis'
waldTest(object, hypothesis)

## S4 method for signature 'LMLike,matrix'
waldTest(object, hypothesis)

## S4 method for signature 'LMlike,character'
lrTest(object, hypothesis)

## S4 method for signature 'LMlike,CoefficientHypothesis'
lrTest(object, hypothesis)

## S4 method for signature 'LMlike,Hypothesis'
lrTest(object, hypothesis)

## S4 method for signature 'LMlike,matrix'
lrTest(object, hypothesis)

## S4 method for signature 'GLMlike'
logLik(object)

Arguments

object  LMLike
formula  formula
design  something coercible to a data.frame
...  passed to model.matrix
hypothesis  one of a CoefficientHypothesis, Hypothesis or contrast matrix.

Value

see section "Methods (by generic)"

Methods (by generic)

* summary: Print a summary of the coefficients in each component.
* update: update the formula or design from which the model.matrix is constructed
* waldTest: Wald test dropping single term specified by CoefficientHypothesis hypothesis
* waldTest: Wald test of contrast specified by contrast matrix hypothesis
* lrTest: Likelihood ratio test dropping entire term specified by character hypothesis naming a term in the symbolic formula.
* lrTest: Likelihood ratio test dropping single term specified by CoefficientHypothesis hypothesis
* lrTest: Likelihood ratio test dropping single term specified by Hypothesis hypothesis
* lrTest: Likelihood ratio test dropping single term specified by contrast matrix hypothesis
* logLik: return the log-likelihood of a fitted model

Slots

* design  a data.frame from which variables are taken for the right hand side of the regression
* fitC  The continuous fit
* fitD  The discrete fit
* response  The left hand side of the regression
**logFC**

- **fitted** A logical with components "C" and "D", TRUE if the respective component has converged
- **formula** A formula for the regression
- **fitArgsC**
- **fitArgsD** Both lists giving arguments that will be passed to the fitter (such as convergence criteria or case weights)

**See Also**

- coef
- lrTest
- waldTest
- vcov
- logLik

---

### logFC

**Calculate log-fold changes from hurdle model components**

**Description**

Using the delta method, estimate the log-fold change from a state given by a vector `contrast0` and the state(s) given by `contrast1`.

**Usage**

```r
logFC(zlmfit, contrast0, contrast1)
```

```r
getLogFC(zlmfit, contrast0, contrast1)
```

**Arguments**

- **zlmfit** ZlmFit output
- **contrast0** vector of coefficients giving baseline contrast, or a Hypothesis. If missing, then the '(Intercept)' is used as baseline.
- **contrast1** matrix of coefficients giving comparison contrasts, or a Hypothesis. If missing, then all non-(Intercept) coefficients are compared.

**Details**

The log-fold change is defined as follows. For each gene, let \( u(x) \) be the expected value of the continuous component, given a covariate \( x \) and the estimated coefficients \( \text{coefC} \), i.e., \( u(x) = \text{crossprod}(x, \text{coefC}) \). Likewise, let \( v(x) = 1/(1+\exp(-\text{crossprod(\text{coefD}, x)})) \) be the expected value of the discrete component. The log fold change from `contrast0` to `contrast1` is defined as

\[
u(\text{contrast1})v(\text{contrast1}) - u(\text{contrast0})v(\text{contrast0}).\]

Note that for this to be a log-fold change, then the regression for \( u \) must have been fit on the log scale. This is returned in the matrix logFC. An approximation of the variance of logFC (applying the delta method to formula defined above) is provided in varLogFC.
logmean

Description

Takes mean of natural scaled values and then logarithm. Approximately the inverse operation of `expavg`.

Calculates \log(\text{mean}(x) + 1)

Usage

`logmean(x)`

Arguments

- `x` numeric

Value

numeric
Examples

```r
x <- 1:10
expavg(logmean(x))
```

LRT  
Likelihood Ratio Tests for SingleCellAssays

Description

Tests for a change in ET binomial proportion or mean of positive ET Likelihood Ratio Test for SingleCellAssay objects

Usage

```r
LRT(sca, comparison, ...)  
## S4 method for signature 'SingleCellAssay,character'
LRT(sca, comparison, referent = NULL, groups = NULL, returnall = FALSE)
```

Arguments

- `sca`  
  A SingleCellAssay class object
- `comparison`  
  A character specifying the factor for comparison
- `...`  
  ignored
- `referent`  
  A character specifying the reference level of comparison.
- `groups`  
  A optional character specifying a variable on which to stratify the test. For each level of groups, there will be a separate likelihood ratio test.
- `returnall`  
  A logical specifying if additional rows should be returned with information about the different components of the test.

Details

Combined Likelihood ratio test (binomial and normal) for SingleCellAssay and derived objects. This function is deprecated, please use lrTest instead.

Value

`data.frame`

See Also

zlm.SingleCellAssay, ZlmFit

Examples

```r
data(vbetaFA)
LRT(vbetaFA, 'Stim.Condition', 'Unstim')
```
Run a likelihood-ratio test

Description

Compares the change in likelihood between the current model and one subject to contrasts tested in hypothesis. hypothesis can be one of a character giving complete factors or terms to be dropped from the model, CoefficientHypothesis giving names of coefficients to be dropped, Hypothesis giving contrasts using the symbolically, or a contrast matrix, with one row for each coefficient in the full model, and one column for each contrast being tested.

Usage

lrTest(object, hypothesis)

Arguments

object
LMlike or subclass

hypothesis
the hypothesis to be tested. See details.

Value

array giving test statistics

See Also

fit
waldTest
Hypothesis
CoefficientHypothesis

Examples

#see ZlmFit-class for examples
example('ZlmFit-class')

Description

A 3D array with first dimension being the genes, next dimension giving information about the test (the degrees of freedom, Chisq statistic, and P value), and final dimension being the value of these quantities on the discrete, continuous and hurdle (combined) levels.

Usage

## S4 method for signature 'ZlmFit,character'
lrTest(object, hypothesis)
melt.SingleCellAssay

Arguments

object
hypothesis
ZlmFit
See Details

Value
3D array

maits
MAITs data set, RNASeq

Description
MAITs data set, RNASeq

Format
a list containing an expression matrix (expressionmat), cell cdat and feature fdat.

See Also
FromMatrix

melt.SingleCellAssay Melt a rectangular array

Description
Return a molten (flat) representation of a rectangular array

Usage
## S3 method for class 'SingleCellAssay'
melt(data, ..., na.rm = FALSE,
    value.name = "value")

Arguments
data
A rectangular array, with attributes attached to its rows and columns

... ignored

na.rm ignored

value.name name of 'values' column containing the measurement

Value
A data.frame typically, with the cartesian product of the row and column attributes and the values from the rectangular array

Examples
data(vbetaFA)
as(vbetaFA[1:10,], 'data.table')
model.matrix

Model matrix accessor

Description
Model matrix accessor

Usage
model.matrix(object, ...)

## S4 method for signature 'LMlike'
model.matrix(object, ...)

Arguments
object   LMlike or subclass
...      ignored

Value
model.matrix if present

Methods (by class)
• LMlike: return the model.matrix

model.matrix<-

Replace model matrix

Description
Replace model matrix

Usage
model.matrix(object) <- value

Arguments
object   LMlike or subclass
value    matrix

Value
modify object
**myBiplot**

*Makes a nice BiPlot*

**Description**

Creates a custom BiPlot for visualizing the results of PCA

**Usage**

```r
myBiplot(pc, colorfactor, scaling = 100, nudge = 1.2, N = 10, 
dims = 1:2, ...)```

**Arguments**

- `pc`: output of `prcomp`
- `colorfactor`: a factor the same length as `nrow(pc$x)` to color the points
- `scaling`: integer to scale the vectors showing loadings
- `nudge`: numeric to offset labels for loadings
- `N`: number of variables with longest `dim[1]` or `dim[2]` projections to display
- `dims`: numeric vector of length 2 indicating which PCs to plot
- `...`: passed to `plot`

**Value**

printed plot

---

**numexp**

*Report number of expressing cells per gene*

**Description**

NAs are removed

**Usage**

```r
numexp(sc)
```

**Arguments**

- `sc`: SingleCellAssay

**Value**

numeric vector
pbootVcov1

Description

Sample cells with replacement to find bootstrapped distribution of coefficients

Usage

pbootVcov1(cl, zlmfit, R = 99)

Arguments

cl: a cluster object created by makeCluster
zlmfit: class ZlmFit
R: number of bootstrap replicates

Value

array of bootstrapped coefficients

plot.thresholdSCRNACountMatrix

Plot cutpoints and densities for thresholding

Description

Plot cutpoints and densities for thresholding

Usage

## S3 method for class 'thresholdSCRNACountMatrix'
plot(x, ask = FALSE, wait.time = 0,
type = "bin", indices = NULL, ...)

Arguments

x: output of thresholdSCRNACountMatrix
ask: if TRUE then will prompt before displaying each plot
wait.time: pause (in seconds) between each plot
type: one or more of the following: 'bin' (plot the genes by the binning used for thresholding), or 'gene' (plot thresholding by gene – see next argument)
indices: if type is equal to 'gene', and is a integer of length 1, then a random sample of indices genes is taken. If it is NULL, then 10 genes are sampled. If it is a integer vector of length > 1, then it is interpreted as giving a list of indices of genes to be displayed.
...: further arguments passed to plot
plotlrt

Value
displays plots

Examples

```r
## See thresholdSCRNACountMatrix
eexample(thresholdSCRNACountMatrix)
```

---

plotlrt  
*Plot a likelihood ratio test object*

Description

Constructs a forest-like plot of signed log10 p-values, possibly adjusted for multiple comparisons. `adjust` can be one of \"holm\", \"hochberg\", \"hommel\", \"bonferroni\", \"BH\", \"BY\", \"fdr\", \"none\".

Usage

```r
plotlrt(lr, adjust = \"fdr\", thres = 0.1, trunc = 1e-06, groups = NULL)
```

Arguments

- `lr`: output from \texttt{lrtest}, with returnall=FALSE
- `adjust`: character, passed along to \texttt{p.adjust}, see below
- `thres`: numeric, genes with adjusted p-values above this value are not depicted
- `trunc`: numeric, p values below this value are truncated at this value
- `groups`: character, grouping value. If provided, must match groups argument passed to \texttt{lrtest}. Plots done separately for each group.

Value

Constructs a dotplot

Author(s)

andrew
plotSCAConcordance

Concordance plots of filtered single vs n-cell assays

Description

Plot the average expression value of two subsets of the data. Generally these might be 1 cell and multiple-cell replicates, in which case if the ncells column ncells is set then the averages will be adjusted accordingly. But it could be any grouping.

Usage

plotSCAConcordance(SCellAssay, NCellAssay, filterCriteria = list(nOutlier = 2, sigmaContinuous = 9, sigmaProportion = 9), groups = NULL, ...)

Arguments

SCellAssay    is a FluidigmAssay for the 1-cell per well assay
NCellAssay    is a FluidigmAssay for the n-cell per well assay
filterCriteria is a list of filtering criteria to apply to the SCellAssay and NCellAssay
groups        is a character vector naming the group within which to perform filtering. NULL by default.
...            passed to getConcordance

Value

printed plot

See Also

getConcordance

Examples

data(vbetaFA)
sca1 <- subset(vbetaFA, ncells==1)
sca100 <- subset(vbetaFA, ncells==100)
plotSCAConcordance(sca1, sca100)

predict.ZlmFit

Return predictions from a ZlmFit object.

Description

Return predictions from a ZlmFit object.

Usage

## S3 method for class 'ZlmFit'
predict(object, newdata = NULL, modelmatrix = NULL, ...)

**Arguments**

- **object**: A `ZlmFit`.
- **newdata**: The data to predict from. Currently ignored, will use the data in the object.
- **modelmatrix**: The model matrix specifying the linear combination of coefficients.
- **...**: Ignored.

**Value**

Predictions and standard errors.

**Examples**

```r
##See stat_ell
evaluation(example(stat_ell))
```

---

### primerAverage

**Average within duplicated genes/primers**

**Description**

.

**Usage**

`primerAverage(fd, geneGroups, fun.natural = expavg, fun.cycle = logshift)`

**Arguments**

- **fd**: SingleCellAssay or subclass.
- **geneGroups**: character naming a column in the featureData that keys the duplicates.
- **fun.natural**: transformation to be used to collapse the duplicate expression values.
- **fun.cycle**: transformation to be used after collapsing.

**Value**

collapsed version of `fd`. 
print.summaryZlmFit

Print summary of a ZlmFit

Description

Shows the top 'n' genes by z score on 'by'

Usage

## S3 method for class 'summaryZlmFit'
print(x, n = 2, by = "logFC", ...)

Arguments

x          output from summary(ZlmFit)
n          number of genes to show
by          one of 'C', 'D' or 'logFC' for continuous, discrete and log fold change z-scores for each contrast
...         ignored

Value

prints a pretty table and invisibly returns a data.table representing the table.

See Also

summary.ZlmFit-method

read.fluidigm

Reads a fluidigm raw data file (or set of files)

Usage

read.fluidigm(files = NULL, metadata = NULL, header.size = 2, skip = 8, cycle.threshold = 40, metadataColClasses = NULL, meta.key = NULL, idvars = NULL, splitby = NULL, unique.well.id = "Chamber.ID", raw = TRUE, assay = NULL, geneid = "Assay.Name", sample = NULL, well = "Well", measurement = "X40.Ct", measurement.processed = "Ct", ncells = "SampleRConc")
Arguments

files A character vector of files to read.
metadata A character path and filename of a CSV file containing additional metadata about the samples
header.size A numeric indicating the number of lines in the header (default 2)
skip numeric how many lines to skip before reading (default 8)
cycle.threshold The maximum number of PCR cycles performed (default 40) numeric
metadataColClasses Optional character vector giving the column classes of the metadata file. See read.table.
meta.key Optional character vector that identifies the key column between the metadata and the fluidigm data
idvars Optional character vector that defines the set of columns uniquely identifying a well (unique cell, gene, and condition).
splitby Optional character that defines the column / variable used to split the resulting data into a list of SingleCellAssay, such that unique levels of splitby each fall into their own SingleCellAssay. Usually the experimental unit subjected to different treatments.
unique.well.id The column that uniquely identifies a sample well in the data. Default is "Chamber.ID".
raw logical flag indicating this is raw data coming off the instrument. Thus we make some assumptions about the column names that are present.
assay character name of a column that uniquely identifies an Assay (i.e. gene). Default is NULL
geneid character names of the column that identifies a gene. Default is "Assay.Name"
sample character name of a column that uniquely identifies a sample
well character name of a column that uniquely identifies a well. Default "Well".
measurement character name of the column that holds the measurement. Default "X40.Ct".
measurement.processed character one of "Ct","40-Ct", or "et". If not "Ct", the measurement will be transformed.
cells The column with the number of cells in this well.

Details

This function reads a raw Fluidigm data file or set of files and constructs a SingleCellAssay (or FluidigmAssay) object.

Value

list of SingleCellAssay holding the data.

Author(s)

Greg Finak
**Description**

The order of terms will be rearrange to suit R’s liking for hierarchy but otherwise the function should be idempotent for

**Usage**

```r
removeResponse(Formula, warn = TRUE)
```

**Arguments**

- **Formula**: formula
- **warn**: Issue a warning if a response variable is found?

**Value**

- formula

**Author(s)**

Andrew

---

**rstandard.bayesglm**

*rstandard for bayesglm objects.*

**Description**

rstandard bayesglm object S3 method

**Usage**

```r
## S3 method for class 'bayesglm'
rstandard(model, infl = influence(model, do.coef = FALSE),
  type = c("deviance", "pearson"), ...)
```

**Arguments**

- **model**: bayesglm
- **infl**: see rstandard
- **type**: see rstandard
- **...**: ignored

**Value**

- numeric residuals
se.coef  

*Return coefficient standard errors*

**Description**

Given a fitted model, return the standard errors of the coefficient.

**Usage**

```r
se.coef(object, ...)
```

**Arguments**

- `object`: a model implementing `vcov`
- `...`: passed to methods

**Value**

vector or matrix

**See Also**

`ZlmFit-class`

**Examples**

```r
# see ZlmFit-class for examples
evaluation example('ZlmFit-class')
```

---

**show,LMlike-method**

**show**

**Description**

Display info

**Usage**

```r
## S4 method for signature 'LMlike'
show(object)
```

```r
## S4 method for signature 'ZlmFit'
show(object)
```

**Arguments**

- `object`: an object of some type

**Details**

Prints information on a LMlike object
**Value**

side effect of printing to console

**Methods (by class)**

- ZlmFit: print info on ZlmFit

---

**split,SingleCellAssay,character-method**

*Split into list*

**Description**

Splits a SingleCellAssay into a list by a factor (or something coercible into a factor) or a character giving a column of colData(x)

**Usage**

```r
## S4 method for signature 'SingleCellAssay,character'
split(x, f, drop = FALSE, ...)
```

**Arguments**

- `x` SingleCellAssay
- `f` length-1 character, or atomic of length ncol(x)
- `drop` drop unused factor levels
- `...` ignored

**Value**

List

**Examples**

```r
data(vbetaFA)
split(vbetaFA, 'ncells')
fa <- as.factor(colData(vbetaFA)$ncells)
split(vbetaFA, fa)
```
stat_ell  

Plot confidence ellipse in 2D

Description

The focus of the ellipse will be the point (x, y) and semi-major axes aligned with the coordinate axes and scaled by xse, yse and the level.

Usage

```r
stat_ell(mapping = NULL, data = NULL, geom = "polygon", position = "identity", na.rm = FALSE, show.legend = NA, inherit.aes = TRUE, fill = NA, level = 0.95, lty = 2, invert = FALSE, alpha = 1, ...)
```

Arguments

- **mapping**: Set of aesthetic mappings created by aes or aes_. If specified and inherit.aes = TRUE (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping.
- **data**: The data to be displayed in this layer. There are three options: If NULL, the default, the data is inherited from the plot data as specified in the call to ggplot. A data.frame, or other object, will override the plot data. All objects will be fortified to produce a data frame. See fortify for which variables will be created.
- **geom**: The geometric object to use display the data.
- **position**: Position adjustment, either as a string, or the result of a call to a position adjustment function.
- **na.rm**: If FALSE (the default), removes missing values with a warning. If TRUE silently removes missing values.
- **show.legend**: logical. Should this layer be included in the legends? NA, the default, includes if any aesthetics are mapped. FALSE never includes, and TRUE always includes.
- **inherit.aes**: If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. borders.
- **fill**: A color or aesthetic mapping to fill color. Defaults to NA for empty ellipses.
- **level**: The confidence level at which to draw an ellipse (default is level=0.95).
- **lty**: The linetype to use. Can map to a variable. Defaults to 2 (dashed line).
- **invert**: vector of length 1 that should either be "x", "y", or TRUE. Specifies whether to plot the estimates from the discrete component on the inverse logit scale. invert specifies which axis to invert.
- **alpha**: transparency
- **...**: other arguments passed on to layer. These are often aesthetics, used to set an aesthetic to a fixed value, like color = "red" or size = 3. They may also be parameters to the paired geom/stat.
Examples

```r
data(vbetaFA)
library(ggplot2)
zlmCond <- zlm(~Stim.Condition, vbetaFA[1:10,])
MM <- model.matrix(~Stim.Condition, unique(colData(vbetaFA)[,c("Stim.Condition"),drop=FALSE]))
predicted <- predict(zlmCond, model.matrix=MM)
plt <- ggplot(predicted)+aes(x=invlogit(muD), y=muC, xse=seD, yse=seC, col=sample)+
    facet_wrap(~primerid, scales="free_y")+theme_linedraw()+
    geom_point(size=0.5)+scale_x_continuous("Proportion expression")+
    scale_y_continuous("Estimated Mean")+
    stat_ell(aes(x=muD, y=muC), level=0.95, invert='x')
## plot with inverse logit transformed x-axis
print(plt)
# doesn't do anything in this case because there are no inestimable coefficients
predictI <- impute(predicted, groupby='primerid')
```

---

**subset,SingleCellAssay-method**

*Subset a SingleCellAssay by cells (columns)*

**Description**

Evaluates the expression in ... in the context of colData(x) and returns a subsetted version of x

**Usage**

```r
## S4 method for signature 'SingleCellAssay'
subset(x, ...)
```

**Arguments**

- `x` SingleCellAssay
- `...` expression

**Value**

SingleCellAssay

**Examples**

```r
data(vbetaFA)
subset(vbetaFA, ncells==1)
```
summarize

Return programatically useful summary of a fit

Description

Return programatically useful summary of a fit

Usage

summarize(object, ...)

Arguments

object  LMlike or subclass
...
other arguments

Value

list of parameters characterizing fit

summary,GSEATests-method

Summarize gene set enrichment tests

Description

Returns a data.table with one row per gene set. This data.table contains columns:

set  name of gene set
cond_Z  Z statistic for continuous component
cont_P  wald P value
cont_effect  difference in continuous regression coefficients between null and test sets (ie, the numerator of the Z-statistic.)
disc_Z  Z statistic for discrete
disc_P  wald P value
disc_effect  difference in discrete regression coefficients between null and test sets.
combined_Z  combined discrete and continuous Z statistic using Stouffer’s method
combined_P  combined P value
combined_adj  FDR adjusted combined P value

Usage

## S4 method for signature 'GSEATests'
summary(object, ...)

summary,GSEATests-method
### Arguments

- **object**: A GSEATests object
- **logFC**: If TRUE, calculate log-fold changes, or output from a call to getLogFC.
- **doLRT**: if TRUE, calculate lrTests on each coefficient, or a character vector of such coefficients to consider.
- **level**: what level of confidence coefficient to return. Defaults to 95 percent.
- **...**: ignored

### Value

A `data.table` with a special print method that shows the top 2 most significant genes by contrast. This `data.table` contains columns:

- **primerid**: the gene
- **component**: C=continuous, D=discrete, logFC=log fold change, S=combined using Stouffer’s method, H=combined using hurdle method
- **contrast**: the coefficient/contrast of interest
- **ci.hi**: upper bound of confidence interval
- **ci.lo**: lower bound of confidence interval
- **coef**: point estimate
- **z**: z score (coefficient divided by standard error of coefficient)
- **Pr(>Chisq)**: likelihood ratio test p-value (only if doLRT=TRUE)

Some of these columns will contain NAs if they are not applicable for a particular component or contrast.

### Description

Returns a `data.table` with a special print method that shows the top 2 most significant genes by contrast. This `data.table` contains columns:

- **primerid**: the gene
- **component**: C=continuous, D=discrete, logFC=log fold change, S=combined using Stouffer’s method, H=combined using hurdle method
- **contrast**: the coefficient/contrast of interest
- **ci.hi**: upper bound of confidence interval
- **ci.lo**: lower bound of confidence interval
- **coef**: point estimate
- **z**: z score (coefficient divided by standard error of coefficient)
- **Pr(>Chisq)**: likelihood ratio test p-value (only if doLRT=TRUE)

Some of these columns will contain NAs if they are not applicable for a particular component or contrast.

### Examples

```r
## See the examples in gseaAfterBoot
eval(gseaAfterBoot)
```

---

**summary.ZlmFit-method**  
*Summarize model features from a ZlmFit object*

### Description

Returns a `data.table` with a special print method that shows the top 2 most significant genes by contrast. This `data.table` contains columns:

- **primerid**: the gene
- **component**: C=continuous, D=discrete, logFC=log fold change, S=combined using Stouffer’s method, H=combined using hurdle method
- **contrast**: the coefficient/contrast of interest
- **ci.hi**: upper bound of confidence interval
- **ci.lo**: lower bound of confidence interval
- **coef**: point estimate
- **z**: z score (coefficient divided by standard error of coefficient)
- **Pr(>Chisq)**: likelihood ratio test p-value (only if doLRT=TRUE)

Some of these columns will contain NAs if they are not applicable for a particular component or contrast.

### Usage

```r
## S4 method for signature 'ZlmFit'
summary(object, logFC = TRUE, doLRT = FALSE, level = 0.95, ...)
```

### Arguments

- **object**: A ZlmFit object
- **logFC**: If TRUE, calculate log-fold changes, or output from a call to getLogFC.
- **doLRT**: if TRUE, calculate lrTests on each coefficient, or a character vector of such coefficients to consider.
- **level**: what level of confidence coefficient to return. Defaults to 95 percent.
- **...**: ignored
summary.thresholdSCRNACountMatrix

Value

data.table

See Also

print.summaryZlmFit

Examples

data(vbetaFA)
z <- zlm(~Stim.Condition, vbetaFA[1:5,])
zs <- summary(z)
names(zs)
print(zs)
#Select 'datatable' component to get normal print method
zs$datatable

summary.thresholdSCRNACountMatrix

Summarize the effect of thresholding

Description

Returns the proportion of (putative) expression, the variance of expressed cells, and -log10 shapiro-wilk tests for normality on the expressed cells

Usage

## S3 method for class 'thresholdSCRNACountMatrix'
summary(object, ...)

## S3 method for class 'summaryThresholdSCRNA'
print(x, ...)

Arguments

object a thresholdSCRNACountMatrix

... currently ignored

x a summaryThresholdSCRNA object, ie output from summary.thresholdSCRNACountMatrix

Value

a list of statistics on the original data, and thresholded data

Methods (by generic)

• print: prints five-number distillation of the statistics and invisibly returns the table used to generate the summary
Threshold a count matrix using an adaptive threshold.

Description
An adaptive threshold is calculated from the conditional mean of expression, based on 10 bins of the genes with similar expression levels. Thresholds are chosen by estimating cutpoints in the bimodal density estimates of the binned data.

Usage

```r
thresholdSCRNACountMatrix(data_all, conditions = NULL, cutbins = NULL, 
nbins = 10, bin_by = "median", qt = 0.975, min_per_bin = 50, 
absolute_min = 0, data_log = TRUE, adj = 1)
```

Arguments
- `data_all` matrix of (possibly log-transformed) counts or TPM. Rows are genes and columns are cells.
- `conditions` Bins are be determined per gene and per condition. Typically contrasts of interest should be specified.
- `cutbins` vector of cut points.
- `nbins` integer number of bins when `cutbins` is not specified.
- `bin_by` character "median", "proportion", "mean" when `bin_by` is "quantile", what quantile should be used to form the bins
- `qt` when `bin_by` is "quantile", what quantile should be used to form the bins
- `min_per_bin` minimum number of genes within a bin
- `absolute_min` numeric giving a hard threshold below which everything is assumed to be noise
- `data_log` is `data_all` log+1 transformed? If so, it will be returned on the (log+1)-scale as well.
- `adj` bandwidth adjustment, passed to `density`

Value
list of thresholded counts (on natural scale), thresholds, bins, densities estimated on each bin, and the original data

Examples

```r
data(maits,package=’MAST’, envir = environment())
sca <- FromMatrix(t(maits$expressionmat[,1:1000]), maits$cdat, maits$fdat[1:1000,])
tt <- thresholdSCRNACountMatrix(assay(sca))
tt <- thresholdSCRNACountMatrix(2^assay(sca)-1, data_log=FALSE)
opar <- par() 
on.exit(par(opar))
par(mfrow=c(4,2))
plot(tt)
```
**vbeta**  \hspace{1cm} **Vbeta Data Set**

**Description**
Vbeta Data Set

**Format**
a data frame with 11 columns. Column Ct contains the cycle threshold, with NA denoting that the threshold was never crossed. So it is inversely proportional to the log2 mRNA, and should be negated (and NAs set to zero) if it is used as a expression measurement for a FluidigmAssay.

**vbetaFA**  \hspace{1cm} **Vbeta Data Set, FluidigmAssay**

**Description**
Vbeta Data Set, FluidigmAssay

**Format**
a FluidigmAssay of the vbeta data set.

**See Also**
`vbeta, FromFlatDF`

**waldTest**  \hspace{1cm} **Run a Wald test**

**Description**
Run a Wald tests on discrete and continuous components hypothesis can be one of a character giving complete factors or terms to be dropped from the model, CoefficientHypothesis giving names of coefficients to be dropped, Hypothesis giving contrasts using the symbolically, or a contrast matrix, with one row for each coefficient in the full model, and one column for each contrast being tested.

**Usage**
waldTest(object, hypothesis)

**Arguments**
- `object`\hspace{1cm}LMlike or subclass
- `hypothesis`\hspace{1cm}the hypothesis to be tested. See details.
waldTest,ZlmFit,matrix-method

Value

array giving test statistics

See Also

fit
lrTest
lht

Examples

#see ZlmFit-class for examples
example('ZlmFit-class')

Description

A 3D array with first dimension being the genes, next dimension giving information about the test (the degrees of freedom, Chisq statistic, and P value), and final dimension being the value of these quantities on the discrete, continuous and hurdle (combined) levels.

Usage

## S4 method for signature 'ZlmFit,matrix'
waldTest(object, hypothesis)

Arguments

  object ZlmFit
  hypothesis See Details

Value

  3D array
xform

Make matrix of continuous expression values, orthogonal to discrete

Description

This centers each column of mat around the mean of its non-zero values.

Usage

xform(mat, scale = FALSE)

Arguments

mat matrix (such as produced by exprs)

scale should the columns also be scaled to have unit variance

Value

matrix

zlm

Convenience function for running a zero-inflated regression

Description

Fits a hurdle model on zero-inflated continuous data in which the zero process is modeled as a logistic regression and (conditional on the the response being >0), the continuous process is Gaussian, ie, a linear regression.

Usage

zlm(formula, data, method = "bayesglm", silent = TRUE, ...)

Arguments

formula model formula

data a data.frame, list, environment or SingleCellAssay in which formula is evaluated

method one of 'glm', 'glmer' or 'bayesglm'. See MAST::methodDict for other possibilities.

silent if TRUE suppress common errors from fitting continuous part

... passed to fit, and eventually to the linear model fitting function

Value

list with "disc"rete part and "cont"inuous part

See Also

GLMlike, LMERlike, BayesGLMlike
Examples

data <- data.frame(x=rnorm(500), z=rbinom(500, 1, .3))
logit.y <- with(data, x*2 + z*2); mu.y <- with(data, 10+10*x+10*z + rnorm(500))
y <- (runif(500)<exp(logit.y)/(1+exp(logit.y)))*1
y[y>0] <- mu.y[y>0]
data$y <- y
fit <- zlm(y ~ x+z, data)
summary.glm(fit$disc)
summary.glm(fit$cont)

Description

For each gene in sca, fits the hurdle model in formula (linear for et>0), logistic for et==0 vs et>0. Return an object of class ZlmFit containing slots giving the coefficients, variance-covariance matrices, etc. After each gene, optionally run the function on the fit named by 'hook'

Usage

zlm.SingleCellAssay(formula, sca, method = "bayesglm", silent = TRUE, 
ebayes = TRUE, ebayesControl = NULL, force = FALSE, hook = NULL, 
parallel = TRUE, LMlike, onlyCoef = FALSE, ...)

Arguments

formula a formula with the measurement variable on the LHS and predictors present in colData on the RHS
sca SingleCellAssay object
method character vector, either 'glm', 'glmer' or 'bayesglm'
silent Silence common problems with fitting some genes
ebayes if TRUE, regularize variance using empirical bayes method
ebayesControl list with parameters for empirical bayes procedure. See ebayes.
force Should we continue testing genes even after many errors have occurred?
hook a function called on the fit after each gene.
parallel If TRUE and option(mc.cores)>1 then multiple cores will be used in fitting.
LMlike if provided, then the model defined in this object will be used, rather than following the formulas. This is intended for internal use.
onlyCoef If TRUE then only an array of model coefficients will be returned (probably only useful for bootstrapping).
... arguments passed to the S4 model object upon construction. For example, fitArgsC and fitArgsD, or coefPrior.

Value

a object of class ZlmFit with methods to extract coefficients, etc.
Empirical Bayes variance regularization

The empirical bayes regularization of the gene variance assumes that the precision (1/variance) is drawn from a gamma distribution with unknown parameters. These parameters are estimated by considering the distribution of sample variances over all genes. The procedure used for this is determined from `ebayesControl`, a named list with components 'method' (one of 'MOM' or 'MLE') and 'model' (one of 'H0' or 'H1') method MOM uses a method-of-moments estimator, while MLE using the marginal likelihood. H0 model estimates the precisions using the intercept alone in each gene, while H1 fits the full model specified by formula

See Also

`ebayes`, `glmlike-class`, `ZlmFit-class`, `BayesGLMlike-class`

Examples

data(vbetaFA)
zlmVbeta <- zlm.SingleCellAssay(~ Stim.Condition, subset(vbetaFA, ncells==1)[1:10,])
slotNames(zlmVbeta)
#A matrix of coefficients
coeff(zlmVbeta, 'D')['CCL2',]
#An array of covariance matrices
vcov(zlmVbeta, 'D')['CCL2',]
waldTest(zlmVbeta, CoefficientHypothesis('Stim.ConditionUnstim'))

ZlmFit-class

An S4 class to hold the output of a call to zlm

Description

This holds output from a call to zlm.SingleCellAssay. Many methods are defined to operate on it. See below.

Usage

## S4 method for signature 'ZlmFit,CoefficientHypothesis'
lrTest(object, hypothesis)

## S4 method for signature 'ZlmFit,Hypothesis'
lrTest(object, hypothesis)

## S4 method for signature 'ZlmFit,matrix'
lrTest(object, hypothesis)

## S4 method for signature 'ZlmFit,CoefficientHypothesis'
waldTest(object, hypothesis)

## S4 method for signature 'ZlmFit,Hypothesis'
waldTest(object, hypothesis)

## S4 method for signature 'ZlmFit'
coef(object, which, ...)
## S4 method for signature 'ZlmFit'
vcov(object, which, ...)

## S4 method for signature 'ZlmFit'
se.coef(object, which, ...)

### Arguments

- **object**: `ZlmFit`
- **hypothesis**: call to `Hypothesis` or `CoefficientHypothesis` or a matrix giving such contrasts.
- **which**: character vector, one of "C" (continuous) or "D" (discrete) specifying which component should be returned
- **...**: ignored

### Value

see "Methods (by generic)"

#### Methods (by generic)

- `lrTest`: Returns an array with likelihood-ratio tests on contrasts defined using `CoefficientHypothesis()`.
- `lrTest`: Returns an array with likelihood-ratio tests specified by `Hypothesis`, which is a `Hypothesis`.
- `lrTest`: Returns an array with likelihood-ratio tests specified by `Hypothesis`, which is a contrast matrix.
- `waldTest`: Returns an array with Wald Tests on contrasts defined using `CoefficientHypothesis()`.
- `waldTest`: Returns an array with Wald Tests on contrasts defined in `Hypothesis()`.
- `coef`: Returns the matrix of coefficients for component which.
- `vcov`: Returns an array of variance/covariance matrices for component which.
- `se.coef`: Returns a matrix of standard error estimates for coefficients on component which.

### Slots

- `coefC`: matrix of continuous coefficients
- `coefD`: matrix of discrete coefficients
- `vcovC`: array of variance/covariance matrices for coefficients
- `vcovD`: array of variance/covariance matrices for coefficients
- `LMlike`: the LmWrapper object used
- `sca`: the SingleCellAssay object used
- `deviance`: matrix of deviances
- `loglik`: matrix of loglikelihoods
- `df.null`: matrix of null (intercept only) degrees of freedom
- `df.resid`: matrix of residual DOF
- `dispersion`: matrix of dispersions (after shrinkage)
- `dispersionNoShrink`: matrix of dispersion (before shrinkage)
- `priorDOF`: shrinkage weight in terms of number of psuedo-obs
priorVar  shrinkage target
converged  output that may optionally be set by the underlying modeling function
hookOut  a list of length ngenes containing output from a hook function, if zlm was called with one
