**dfModel-class**

Class "dfModel": A class to represent a data frame model

---

**Description**

dfModel is a class to represent a data frame model. This class inherits from the virtual class, gModel. An object of dfModel is responsible for storing and updating the data.

**Objects from the Class**

Objects can be created by calls of the form `new("dfModel", ...). The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNetwork and iSPlot packages).

**Slots**

- `modelData`: the model data, which is a data frame
- `virtualData`: data that is needed by views of this model, will be a data frame
- `linkData`: a list of functions that link this model to its parent and child models (if it has any)
- `modelName`: the name of this model
- `modelVar`: a list of variables that refer to the modelData (for instance this may be t-test values that were calculated from the modelData)

**Extends**

Class "gModel", directly.

**Methods**

No methods defined with class "dfModel" in the signature. The methods for this class will be created in other packages that use this package like iSNetwork and iSPlot.

`gModel-class`
Class "gAddChildMessage": A class to represent an add child MVC message

Description

gAddChildMessage class represents an add child MVC message. This class will create a new MVC object that is a child of the current MVC object. gAddChildMessage inherits from the class, gAddMessage, which inherits from the virtual class, gMessage. The initialize and handleMessage methods will be defined in other packages that use this class (for example, the iSNNetwork package).

Objects from the Class

Objects can be created by calls of the form new("gAddChildMessage", ...). The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNNetwork package).

Slots

dataName: the name of the new child model (MVC)

mData: a list of information needed to add the new model

type: the type of the new model (for now, it may be a data.frame, ExpressionSet, or graph)

Extends

Class "gAddMessage", directly. Class "gMessage", by class "gAddMessage".

Methods

No methods defined with class "gAddChildMessage" in the signature.

Class "gAskAncestorMessage": A class to represent a question asking for data from an ancestor model

Description

gAskAncestorMessage is a class to ask for model data from an ancestor model (MVC). For example, if a user wants to create a child model, but needs data from both its parent and its grandparent model. Then when the parent model creates the new child model it would ask its parent (the grandparent of the new child model) for data using this class.

A specific example is if the original model contains microarray expression data and a child model of this model is the GO graph. Then if the user wants to look at the expression data of only genes annotated at a particular node, a child model can be created from the GO graph, but this new child model also needs data from the original model (its grandparent). Thus, when the GO graph creates a child model it needs to ask its parent for the expression data.

Objects from the Class

Objects can be created by calls of the form new("gAskAncestorMessage", ...).

Slots

type: which model type to look for as an ancestor (this is a character string naming the class)
mData: the data that is being requested
from: the MVC that asked the question

Extends

Class "gMessage", directly.

Methods

from<-  Sets the from slot
from  Returns the from slot
mData<-  Sets the mData slot
mData  Returns the mData slot
type<-  Sets the type slot
type  Returns the type slot
**genView-class**

**Note**

Even though this class is used to ask for information from an ancestor, each model (MVC) has only one parent. This is important when considering how data sets are linked.

**Author(s)**

Elizabeth Whalen

gMessage-class

---

**genView-class**

*Class “genView”: A virtual class to describe a view*

**Description**

`genView` is a virtual class that all view classes inherit from. All views will contain the information of what window (slot `win`) they are stored in, what data (slot `dataName`) is shown in the view, and the number of the window (slot `winNum`) that shows the view.

**Objects from the Class**

A virtual Class: No objects may be created from it.

**Slots**

- `dataName`: a character string describing what data are shown in the view
- `win`: an object of class "GtkWindow" that holds the view
- `winNum`: a number that tells what number view this is (for example, the first view created will have `winNum=1`)

**Methods**

- `dataName<-` Sets the `dataName` slot
- `dataName` Returns the `dataName` slot
- `win<-` Sets the `win` slot
- `win` Returns the `win` slot
- `winNum<-` Sets the `winNum` slot
- `winNum` Returns the `winNum` slot

Also, all view objects will have two methods, `redrawView` and `updateView`, that will define how a view should be redrawn when the underlying data has changed. The `redrawView` method will completely redraw the view, while the `updateView` method will only redraw the parts of the view that have changed. Both of these methods, `redrawView` and `updateView`, will be defined in packages that use this package, such as iSPlot and iSNetwork. Also, all views will have an `identifyView` method that will identify an object (such as a point, a node, a row, etc.) on the view given some location on the view (such as the user coordinates).
**gEventFun-class**

`plotView-class`, `sPlotView-class`, `spreadView-class`

---

**gEventFun-class** *A class to link a callback function with an event*

**Description**

The `gEventFun` class creates an object which contains all the needed information to link a callback function to an event. The `gEventFun` object will hold all of the callback function information, including the callback function, a short description of what the callback function does, and a list of all preprocessing functions that must be called.

**Objects from the Class**

Objects can be created by calls of the form `new("gEventFun", ...)`.  

**Slots**

- `callFun`: the callback function
- `shortName`: a short description of what the callback function does
- `preprocessFun`: a list of preprocessing functions that must be called before the callback function (this can be NULL)

**Methods**

- `callFun<-`: Sets the `callFun` slot
- `callFun`: Returns the `callFun` slot
- `preprocessFun<-`: Sets the `preprocessFun` slot
- `preprocessFun`: Returns the `preprocessFun` slot
- `shortName<-`: Sets the `shortName` slot
- `shortName`: Returns the `preprocessFun` slot

Elizabeth Whalen
Class "gMessage": A virtual class for messages

**Description**

gMessage is a virtual class from which all other message classes will inherit. Message objects will be created whenever there is communication between the model, view, and controller components or between MVC objects.

**Objects from the Class**

A virtual Class: No objects may be created from it.

**Methods**

No methods defined with class "gMessage" in the signature. However, all message classes will have a handleMessage method that will read the message and notify the appropriate components so that the information in the message can be acted upon. The handleMessage methods will be defined in packages that use this package, such as iSPlot and iSNetwork.

**Author(s)**

Elizabeth Whalen

**See Also**

Class "gModel": A virtual class for models

**Description**

gModel is a virtual class from which all other model classes will inherit. Model objects will be responsible for storing and updating the data sets.

**Objects from the Class**

A virtual Class: No objects may be created from it.

**Slots**

modelData: the actual model data

linkData: a list of the functions to link this data to its parent and child models (if it has any)

virtualData: data that pertains to the views of this model

modelName: the name of the model (will be the same name as the MVC)

modelVar: a list of variables that refer to the modelData (for instance this may be t-test values that were calculated from the modelData)
Methods

    linkData<- Sets the linkData slot
    linkData  Returns the linkData slot
    modelData<- Sets the modelData slot
    modelData  Returns the modelData slot
    modelName<- Sets the modelName slot
    modelName  Returns the modelName slot
    virtualData<- Sets the virtualData slot
    virtualData  Returns the virtualData slot
    modelVar<- Sets the modelVar slot
    modelVar  Returns the modelVar slot

Also, all models will have an updateModel method that will be defined in the packages that use
this package (for example, iSPlot and iSNetwork). The updateModel method will be called by
a gUpdateDataMessage object when the data needs to be updated. Another method that may be
defined for certain models is the provideInfo method that will return model information when it is
asked for by a gAskAncestorMessage object.

gModifyMessage-class  Class "gModifyMessage": A class to represent a modify message

Description

gModifyMessage is a virtual class to represent a modify message. Both gAddMessage and gUp-
dateMessage classes are inherited from gModifyMessage.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

dataName: the name of the data to be added or the name of the data that the view will visualize
mData: a list of information needed to perform the addition
type: the type of addition to perform (ex. which type of model to add or which type of view to
    add)

Extends

Class "gMessage", directly.
Methods

- `dataName<-` Sets the `dataName` slot
- `dataName` Returns the `dataName` slot
- `mData<-` Sets the `mData` slot
- `mData` Returns the `mData` slot
- `type<-` Sets the `type` slot
- `type` Returns the `type` slot

gSendParentMessage-class

Class "gSendParentMessage"; A class to represent a send parent MVC message

Description

gSendParentMessage is a class to represent a send parent MVC message. Whenever a model is updated and that model has a parent MVC, then an object of this class will be created to notify the parent MVC that a child model was updated. gUpdateParentMessage inherits from the virtual class, gMessage. The initialize and handleMessage methods will be defined in other packages that use this class (for example, the iSNetwork package).

Objects from the Class

Objects can be created by calls of the form `new("gSendParentMessage",...). The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNetwork package).

Slots

- **childUpdateDataMessage**: an object of class gUpdateDataMessage that was used to update the child model (MVC)

Extends

Class "gMessage", directly.

Methods

- **childUpdateDataMessage**<- Sets the childUpdateDataMessage slot
- **childUpdateDataMessage** Returns the childUpdateDataMessage slot

gUpdateDataMessage-class

Class "gUpdateDataMessage": A class to represent an update data message

Description

gUpdateDataMessage is a class to represent an update data message. gUpdateDataMessage is inherited from the virtual class, gUpdateMessage. Whenever a gUpdateDataMessage is created (initialized), the next step is to call the handleMessage method to act upon that message and update the data.

Objects from the Class

Objects can be created by calls of the form new("gUpdateDataMessage",...). The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNetwork and iSPlot packages).

Slots

from: the name of the MVC (model) that this update message came from
type: the type of update to perform
mData: a list of the information needed to perform the update
dataName: the name of the data set to be updated

Extends

Class "gUpdateMessage", directly. Class "gModifyMessage", by class "gUpdateMessage". Class "gMessage", by class "gUpdateMessage".

Methods

from<- Sets the from slot
from Returns the from slot

linkedModelMVC-class  Class "linkedModelMVC": A class to represent a MVC object that can be linked to other MVC objects

Description

linkedModelMVC is a class to represent a model-view-controller object that can be linked to other MVC objects. The linkedModelMVC class will combine these three components (model, view and controller) so that the MVC objects can be reused and it has the slots, parentMVC and childMVCList, to link this MVC object with other MVC objects.

Objects from the Class

Objects can be created by calls of the form new("linkedModelMVC", ...).

Slots

model: the model object (will inherit from the gModel virtual class)
viewList: a list of the view objects that visualize the model
controller: the environment that stores information for the MVC object
parentMVC: the name of the parent model (MVC) if there is a parent model
childMVCList: a list of the names of the child models (MVCs); it may be an empty list if there are no children

Extends

Class "singleModelMVC", directly. Class "MVC", by class "singleModelMVC".

MVC-class  Class "MVC": A virtual class to represent a model-view-controller object

Description

MVC is a virtual class to represent a model-view-controller object. The MVC class will combine these three components (model, view and controller) so that the MVC objects can be reused and linked.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

model: the model object (will inherit from the gModel virtual class)
viewList: a list of the view objects that visualize the model
controller: the environment that stores information for the MVC object

Methods

controller<-  Sets the controller slot
controller  Returns the controller slot
model<-  Sets the model slot
model  Returns the model slot
viewList<-  Sets the viewList slot
viewList  Returns the viewList slot

Author(s)

Elizabeth Whalen

See Also

gModel-class, genView-class, singleModelMVC-class, linkedModelMVC-class
plotView-class

Class "plotView": A virtual class to represent a plot view

Description

plotView is a virtual class to represent a view that is a plot. Any particular types of plots can inherit from this class. For instance, sPlotView, is a class that inherits from plotView and represents a scatterplot view.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

plotDevice: the plot device number
plotPar: the parameter list for the plot, see par()
drArea: an object of class "GtkDrawingArea"
dataName: a character string describing what data are shown in the view
win: an object of class "GtkWindow" that holds the view
winNum: a number that tells what number view this is (for example, the first view created will have winNum=1)

Extends

Class "genView", directly.

Methods

drArea<- Sets the drArea slot
drArea Returns the drArea slot
plotDevice<- Sets the plotDevice slot
plotDevice Returns the plotDevice slot
plotPar<- Sets the plotPar slot
plotPar Returns the plotPar slot

Also, all classes that inherit from plotView will have clickEvent and motionEvent methods. The clickEvent method will be called whenever a user clicks on the plot and the motionEvent method will be called whenever a user moves the cursor over the plot. These methods will be defined in packages that use this package, such as iSPlot and iSNetwork. Note that the clickEvent method will also be defined for the spreadView class and this will correspond to a user selecting a row on the spreadsheet.

qqPlotView-class

Class "qqPlotView": A class to represent a qq-plot

Description

qqPlotView is a class to represent a qq-plot. For now, this class will be used to create qq-plot views of gene set enrichment data (stored in the gseModel). qqPlotView inherits from the class, plotView, which inherits from the virtual class, genView.

Objects from the Class

Objects can be created by calls of the form `new("qqPlotView", ...)`. The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNnetwork package).

Slots

xval: the x values for the points plotted
yval: the y values for the points plotted
plotDevice: the plot device number
plotPar: the parameter list for the plot, see par()
drArea: an object of class "GtkDrawingArea"

dataName: a character string describing what data are shown in the view
win: an object of class "GtkWindow" that holds the view
winNum: a number that tells what number view this is (for example, the first view created will have winNum=1)

Extends

Class "plotView", directly. Class "genView", by class "plotView".

Methods

xval<- Sets the xval slot
xval Returns the xval slot
yval<- Sets the yval slot
yval Returns the yval slot

**singleModelMVC-class**

Class "singleModelMVC": A class to represent a single model-view-controller object.

**Description**

singleModelMVC is a class to represent a model-view-controller object that cannot be linked to other MVC objects (i.e. single refers to the MVC object being unlinked). The singleModelMVC class will combine thee three components (model, view and controller) so that the MVC objects can be reused.

**Objects from the Class**

Objects can be created by calls of the form `new("singleModelMVC", ...)``.

**Slots**

- **model**: the model object (will inherit from the gModel virtual class)
- **viewList**: a list of the view objects that visualize the model
- **controller**: the environment that stores information for the MVC object

**Extends**

Class "MVC", directly.

**Methods**

No methods defined with class "singleModelMVC" in the signature.

**sPlotView-class**

Class "sPlotView": A class to represent a scatterplot view.

**Description**

sPlotView is a class to represent a view that is a scatterplot. sPlotView inherits from the class, plotView, which inherits from the virtual class, genView.

**Objects from the Class**

Objects can be created by calls of the form `new("sPlotView", ...)`. The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNNetwork and iSPlot packages).
Slots

dfRows: the names of the data frame rows that will be plotted
xvar: the name of the data frame variable (column) that will be plotted on the x axis
yvar: the name of the data frame variable (column) that will be plotted on the y axis
plotDevice: the plot device number
plotPar: the parameter list for the plot, see par()
drArea: an object of class "GtkDrawingArea"
dataName: a character string describing what data are shown in the view
win: an object of class "GtkWindow" that holds the view
winNum: a number that tells what number view this is (for example, the first view created will have winNum=1)

Extends

Class "plotView", directly. Class "genView", by class "plotView".

Methods

xvar<-  Sets the xvar slot
   xvar  Returns the xvar slot

spreadView-class  Class "spreadView": A class to represent a spreadsheet view

Description

spreadView is a class to represent a view that is a spreadsheet. spreadView inherits from the virtual class, genView.

Objects from the Class

Objects can be created by calls of the form new("spreadView", ...). The initialize method for this class will be created in other packages that use this package (for example, the initialize method will be created in the iSNetwork and iSPlot packages).
Slots
- **clist**: an object of class "GtkCList", i.e. the spreadsheet
- **dataName**: a character string describing what data are shown in the view
- **win**: an object of class "GtkWindow" that holds the view
- **winNum**: a number that tells what number view this is (for example, the first view created will have winNum=1)

Extends
- Class "genView", directly.

Methods
- **clist<-**: Sets the clist slot
- **clist**: Returns the clist slot

This class will also have a clickEvent method, which will be called whenever a user selects a row on the spreadsheet. This method will be defined in packages that use this package, such as iSPlot and iSNetwork.
