Package ‘MantelCorr’

January 30, 2017

Title    Compute Mantel Cluster Correlations
Version  1.44.0
Date     2005-17-10
Author   Brian Steinmeyer and William Shannon
Description Computes Mantel cluster correlations from a (p x n) numeric data matrix (e.g. microarray gene-expression data).

<table>
<thead>
<tr>
<th>ClusterGeneList</th>
<th>Generate Genes from a Cluster List</th>
</tr>
</thead>
</table>

Description

‘ClusterGeneList’ produces a list of both significant and nonsignificant genes from each respective cluster type

Usage

ClusterGeneList(clus, clustlist.sig, x.data)
ClusterGeneList

Arguments

clus 'clusters' object returned by 'GetClusters'
clustlist.sig 'SignificantClusters' object returned by 'ClusterList'
x.data original (p x n) numeric data matrix (e.g., gene-expression data)

Value

A list with components:

SignificantClusterGenes significant cluster genes returned from 'ClusterList'
NonSignificantClusterGenes nonsignificant cluster genes returned from 'ClusterList'

Note

argument 'x.data' should have an ID gene variable, 'probes', attached as a 'dimnames' attribute

Author(s)

Brian Steinmeyer

See Also

'GetClusters' 'ClusterList'

Examples

# simulate a p x n microarray expression dataset, where p = genes and n = samples
data.sep <- rbind(matrix(rnorm(1000), ncol=50), matrix(rnorm(1000, mean=5), ncol=50))
noise <- matrix(runif(40000), ncol=1000)
data <- t(cbind(data.sep, noise))
data <- data[1:200, ]
# data has p = 1,050 genes and n = 40 samples

clusters.result <- GetClusters(data, 100, 100)
dist.matrices <- DistMatrices(data, clusters.result$clusters)
mantel.corr <- MantelCorrs(dist.matrices$Dfull, dist.matrices$Dsubsets)
permutation.result <- PermutationTest(dist.matrices$Dfull, dist.matrices$Dsubsets, 100, 40, 0.05)

# generate both significant and non-significant gene clusters
cluster.list <- ClusterList(permutation.result, clusters.result$cluster.sizes, mantel.corr)

# significant and non-significant cluster genes (expression values)
cluster.genes <- ClusterGeneList(clusters.result$clusters, cluster.list$SignificantClusters, data)
ClusterList

**Description**

'ClusterList' generates a list of both significant and nonsignificant clusters, with cluster number, Mantel cluster correlation and size.

**Usage**

ClusterList(p.val, clus.size, mantel.cors)

**Arguments**

- p.val: permutation p-value returned from 'PermutationTest'
- clus.size: vector of k cluster sizes returned from 'GetCluster'
- mantel.cors: original, unpermuted k Mantel correlations returned from 'MantelCorrs'

**Value**

A list with components:

- **SignificantClusters**: clusters with significant Mantel correlation, equal to or larger than the permutation p-value returned by 'PermutationTest'
- **NonSignificantClusters**: clusters with nonsignificant Mantel correlation, smaller than the permutation p-value returned by 'PermutationTest'

**Author(s)**

Brian Steinmeyer

**See Also**

'PermutationTest'

**Examples**

```r
# simulate a p x n microarray expression dataset, where p = genes and n = samples
data.sep <- rbind(matrix(rnorm(1000), ncol=50), matrix(rnorm(1000, mean=5), ncol=50))
note <- matrix(rnorm(40000), ncol=1000)
data <- t(cbind(data.sep, note))
data <- data[1:200, ]  # data has p = 1,050 genes and n = 40 samples

clusters.result <- GetClusters(data, 100, 100)
dist.matrices <- DistMatrices(data, clusters.result$clusters)
mantel.cors <- MantelCorrs(dist.matrices$Dfull, dist.matrices$Dsubsets)
permutation.result <- PermutationTest(dist.matrices$Dfull, dist.matrices$Dsubsets, 100, 40, 0.05)

# generate both significant and non-significant gene clusters
```
cluster.list <- ClusterList(permutation.result, clusters.result$cluster.sizes, mantel.corrs)

DistMatrices

Compute Dissimilarity Matrices

Description

'DistMatrices' uses 'dist' to compute dissimilarity matrices for 'data' and each cluster k from 'GetClusters'

Usage

DistMatrices(x.data, cluster.assignment)

Arguments

x.data
original 'data' matrix

cluster.assignment
cluster assignment vector, "clusters", returned by 'GetClusters'

Value

returns a list with two components:

Dsubsets dissimilarity matrices for each cluster k
Dfull dissimilarity matrix for the original 'data'

Note

'GetClusters' should be executed prior to 'DistMatrices'

Author(s)

Brian Steinmeyer

'GetClusters'

Examples

# simulate a p x n microarray expression dataset, where p = genes and n = samples
data.sep <- rbind(matrix(rnorm(1000), ncol=50), matrix(rnorm(1000, mean=5), ncol=50))
noise <- matrix(runif(40000), ncol=1000)
data <- t(cbind(data.sep, noise))
data <- data[1:200, ] # data has p = 1,050 genes and n = 40 samples
clusters.result <- GetClusters(data, 100, 100)
dissimilarity.matrices <- DistMatrices(data, clusters.result$clusters)
GetClusters

Over-Partition a (p x n) Data Matrix using 'kmeans'

Description

'GetClusters' uses an overly large k with the 'kmeans' function to over-partition p variables (rows = genes) from n objects (cols = samples) from a given data matrix 'x.data'

Usage

GetClusters(x.data, num.k, num.iters)

Arguments

x.data p x n data matrix of numeric values
num.k number of k partitions desired
num.iters number of iterations - recommend >= 100

Value

'GetClusters' returns a list with the following components:

clusters cluster assignment from 'kmeans'
cluster.sizes size of each cluster k from 'kmeans'

Note

The input data matrix, x.data, must be numeric (e.g., gene-expression values). We recommend using 'num.k' = one-half the number of genes and 'num.iters' greater than 50

Examples

# simulate a p x n microarray expression dataset, where p = genes and n = samples
data.sep <- rbind(matrix(rnorm(1000), ncol=50), matrix(rnorm(1000, mean=5), ncol=50))
noise <- matrix(runif(40000), ncol=1000)
data <- t(cbind(data.sep, noise))
data <- data[1:200, ]
# data has p = 1,050 genes and n = 40 samples
clusters.result <- GetClusters(data, 100, 100)
Description
Samples were taken with Affymetrix Hgu6800 chips and expression levels measured on 7,129 genes (probes). The samples consist of 27 acute lymphoblastic leukemia (ALL) and 11 acute myeloid leukemia (AML) patients. The data values are raw (e.g. no standardization or gene filtering applied).

Usage
data(GolubTrain)

Format
A data frame of 7129 observations (genes) with the following 38 variables (samples):

X1 ALL
X2 ALL
X3 ALL
X4 ALL
X5 ALL

MantelCorrs Compute Mantel Correlation(s)

Description
'MantelCorrs' computes the Mantel correlation between two dissimilarity matrices

Usage
MantelCorrs(Dfull, Dsubsets)

Arguments
Dfull distance matrix returned by 'DistMatrices' using original 'data'
Dsubsets list of distance matrices from each k cluster or partition returned by 'DistMatrices'

Value
A list with k components
where component i
Mantel correlation for cluster i, i = 1,...,k
Warning
The function is meant to be executed AFTER 'GetClusters' and 'DistMatrices' (see example)

Note
the value 'k' corresponds to the parameter 'num.k' in 'GetClusters'

Examples

# simulate a p x n microarray expression dataset, where p = genes and n = samples
data.sep <- rbind(matrix(rnorm(1000), ncol=50), matrix(rnorm(1000, mean=5), ncol=50))
noise <- matrix(runif(40000), ncol=1000)
data <- t(cbind(data.sep, noise))
data <- data[1:200, ]
# data has p = 1,050 genes and n = 40 samples

clusters.result <- GetClusters(data, 100, 100)
dist.matrices <- DistMatrices(data, clusters.result$clusters)
mantel.corrs <- MantelCorrs(dist.matrices$Dfull, dist.matrices$Dsubsets)

### Description
'PermutationTest' computes and returns an empirical p-value from a null distribution generated by permuting 'Dfull' a total of 'num.per' times.

### Usage
PermutationTest(Dfull, Dsubsets, num.per, num.chips, alpha)

### Arguments
- **Dfull**: dissimilarity matrix from the original (p x n) microarray expression data
- **Dsubsets**: dissimilarity matrices from each k disjoint clusters returned by 'GetClusters'
- **num.per**: number of permutations
- **num.chips**: number of samples, 'n' from the original (p x n) data matrix
- **alpha**: desired level of significance
Details

For each permutation, k Mantel correlations are computed by correlating the permuted ‘Dfull’ with each dissimilarity matrix ‘Dsubsets’ from the ‘k’ clusters returned by ‘GetClusters’. The absolute value of the maximum Mantel cluster correlation is retained at each permutation. These ‘num.per’ maximum correlations are then used to generate a null distribution for distance metric independence, with the p-value taken from the (1 - ‘alpha’) percentile of this permutation distribution.

Value

returns the permuted p-value for the ‘alpha’ selected level of significance

Warning

(p x n) data matrix should be numeric (e.g. gene-expression levels)

Note

The function is meant to be executed AFTER ‘GetClusters’, ‘DistMatrices’ and ‘MantelCorr’ (see example)
