Package ‘MatrixRider’
March 28, 2017

Type Package
Title Obtain total affinity and occupancies for binding site matrices on a given sequence
Version 1.6.0
Date 2015-11-02
Author Elena Grassi
Maintainer Elena Grassi <grassi.e@gmail.com>
Description Calculates a single number for a whole sequence that reflects the propensity of a DNA binding protein to interact with it. The DNA binding protein has to be described with a PFM matrix, for example gotten from Jaspar.

biocViews GeneRegulation, Genetics, MotifAnnotation
License GPL-3
Depends R (>= 3.1.2)
Imports methods, TFBSTools, IRanges, XVector, Biostrings
Suggests RUnit, BiocGenerics, BiocStyle, JASPAR2014
LinkingTo IRanges, XVector, Biostrings, S4Vectors
NeedsCompilation yes

Index

MatrixRider-package  Calculate total affinity and occupancies for binding site matrices on a given sequence

Description

Calculates a single number for a whole sequence that reflects the propensity of a DNA binding protein to interact with it. The DNA binding protein has to be described with a PFM matrix, for example gotten from Jaspar.
getSeqOccupancy

Author(s)
Elena Grassi <elena.grassi@unito.it>

Examples

library(JASPAR2014)
library(TFBSTools)
library(Biostrings)
pfm <- getMatrixByID(JASPAR2014, "MA0004.1")
## The following sequence has a single perfect match
## thus it gives the same results with all cutoff values.
sequence <- DNAString("CACGTG")
getSeqOccupancy(sequence, pfm, 0.1)
getSeqOccupancy(sequence, pfm, 1)

getSeqOccupancy Computes the total affinity or the occupancy at a given cutoff

Description

The affinity/occupancy is calculated on the given DNAString for the given PFMatrix (or all the ones in the PFMatrix list given).

Usage

getSeqOccupancy(sequence, pfm, cutoff)

Arguments

sequence A DNAString object with the sequence for which affinity will be computed.

pfm A PFMatrix or a PFMatrixList object with the matrixes whose affinity will be calculated. The background (bg, XMatrix-method) of the given pfm is used to perform affinity calculations.

cutoff numeric(1); between 0 and 1 (included): 0 corresponds to total affinity (i.e. summing all the affinities) while 1 to summing only values corresponding to the perfect match for a given PFMatrix. See vignette for details on how scores are calculated. If MatrixRider is installed, open the vignette with vignette("MatrixRider").

Value

numeric; the resulting total affinity calculated on the given fasta. If a PFMatrixList has been passed then a named numeric vector with the affinities for all the PFM. The vignette has all the details on the calculations (such as PFM to PWM conversion and pseudocounts).

Examples

library(JASPAR2014)
library(TFBSTools)
library(Biostrings)
pfm <- getMatrixByID(JASPAR2014, "MA0004.1")
## The following sequence has a single perfect match
## thus it gives the same results with all cutoff values.
sequence <- DNAString("CACGTG")
getSeqOccupancy(sequence, pfm, 0.1)
getSeqOccupancy(sequence, pfm, 1)

pfm2 <- getMatrixByID(JASPAR2014,"MA0005.1")
pfms <- PFMatrixList(pfm, pfm2)
names(pfms) <- c(name(pfm), name(pfm2))
## This calculates total affinity for both the PFMatrixes.
getSeqOccupancy(sequence, pfms, 0)
