Package ‘MinimumDistance’

January 21, 2017

Title A Package for De Novo CNV Detection in Case-Parent Trios

Version 1.18.0

Date 2016-03-05

Author Robert B Scharpf and Ingo Ruczinski

Maintainer Robert B Scharpf <rscharpf@jhu.edu>

Description Analysis of de novo copy number variants in trios from high-dimensional genotyping platforms.

License Artistic-2.0

Depends R (>= 3.3), VanillaICE (>= 1.31.3)

Imports methods, BiocGenerics, Biobase, S4Vectors (>= 0.9.25), IRanges, GenomeInfoDb, GenomicRanges (>= 1.17.16), SummarizedExperiment (>= 0.2.0), oligoClasses, DNAcopy, ff, foreach, matrixStats, lattice, data.table, grid, stats, utils

Suggests human610quadv1bCrlmm (>= 1.0.3), BSgenome.Hsapiens.UCSC.hg18, BSgenome.Hsapiens.UCSC.hg19, SNPchip, RUnit

Enhances snow, doSNOW

Function for computing autocorrelations

Description

By default, this function returns the lag-10 autocorrelations of a numeric vector and omits missing values.

Usage

```r
acf2(x, lag.max = 10, type = c("correlation", "covariance", "partial"),
     plot = FALSE, na.action = na.omit, demean = TRUE, ...)
```

Arguments

- `x`: a numeric vector
- `lag.max`: see `acf`
- `type`: see `acf`
- `plot`: logical, as in `acf`
- `na.action`: ignored. Missing values are automatically omitted.
- `demean`: logical, as in `acf`
- `...`: additional arguments passed to `acf`

See Also

- `acf`

Examples

```r
x <- rnorm(100)
x[5] <- NA
acf2(x)
```

deprecated function to calculate the minimum distance

Description

The 'minimum distance' is the minimum signed absolute difference of the parental log R ratios and the offspring log R ratios. Specifically, let IO-FI denote the absolute difference in the log R ratios comparing offspring to father and IO-MI the absolute difference in the log R ratios comparing offspring to mother. The minimum distance at a marker is the signed minimum of IO-MI and IO-FI. After segmentation of the minimum distance, non-zero segments can indicate a de novo difference in the log R ratio of the offspring and either parent. For example, a positive minimum distance suggests that the log R ratio from the offspring is greater than the log R ratio of either parent.
**Usage**
calculateMindist(object, ...)

## S4 method for signature 'TrioSet'
calculateMindist(object, verbose = TRUE, ...)

## S4 method for signature 'TrioSetList'
calculateMindist(object)

## S4 method for signature 'list'
calculateMindist(object, outdir = ldPath(), ...)

## S4 method for signature 'arrayORff_array'
calculateMindist(object, outdir, center, ...)

## S4 method for signature 'matrix'
calculateMindist(object, ...)

**Arguments**

object | see showMethods("calculateMindist")
---|---
... | Ignored
verbose | logical. Whether to display messages indicating progress.
outdir | character string indicating path to save output
center | ignored

calculateMindist

**Description**
Coercion methods in MinimumDistance package
Coerces a TrioSetList to a TrioSet

**Usage**
as(from, to)

## S4 method for signature 'TrioSetList'
stack(x, ...)

**Arguments**

x | a TrioSetList
---|---
... | ignored
from | see showMethods("coerce")
to | see showMethods("coerce")

**Value**
a TrioSet
**denovoHemizygous**

*Filter the genomic intervals for denovo copy number states*

**Description**

This function filters the genomic intervals for denovo events.

**Usage**

```r
denovoHemizygous(object, filters = FilterParamMD(state = "221"))
denovoHomozygous(object, filters = FilterParamMD(state = "220"))
denovo(object, filters = FilterParamMD(state = c("220", "221", "224")))
denovoDuplication(object, filters = FilterParamMD(state = "224"))
```

## S4 method for signature 'MinDistPosterior'

denovoHemizygous(object, filters = FilterParamMD(state = "221"))

## S4 method for signature 'MinDistPosterior'

denovoHomozygous(object, filters = FilterParamMD(state = "220"))

## S4 method for signature 'MinDistPosterior'

denovoDuplication(object, filters = FilterParamMD(state = "224"))

## S4 method for signature 'MinDistPosterior'

denovo(object, filters = FilterParamMD(state = c("220", "221", "224")))

**Arguments**

- **object** see `showMethods(denovo)` for a list of defined methods
- **filters** an object of class `FilterParamMD`

**Details**

The function `denovo` filters genomic intervals for states '220', '221', and '224', corresponding to denovo homozygous deletion, denovo hemizygous deletion, and denovo duplication, respectively. `denovoHemizygous` filters genomic intervals for state '221'.

**See Also**

`FilterParamMD-class`
DNAcopyParam Constructor for DNAcopyParam class

Description

Creates an instance of a parameter class for circular binary segmentation of the minimum distance and the log R ratios. Parameters in this object are passed to the segment function in the package DNAcopy.

Usage

DNAcopyParam(alpha = 0.01, min.width = 2L, undo.splits = c("none", "prune", "sundo"), undo.SD = 3)

Arguments

alpha see segment
min.width see segment
undo.splits see segment
undo.SD see segment

See Also

segment

Examples

segment_params <- DNAcopyParam(alpha=0.01)
params <- MinDistParam(dnacopy=segment_params)

exampleTrioSetList An example TrioSetList object

Description

A dataset containing log R ratios and B allele frequencies for two chromosomes, organized as a TrioSetList. Each element in the list class is a TrioSet object. Both TrioSetList and TrioSet classes are deprecated; the example data will be removed in a future release.

Format

a TrioSetList
filterExperiment  
*Methods for filtering MinDistExperiment objects*

**Description**
Filter a MinDistExperiment object to exclude markers with missing values in the low-level summaries, exclude markers that lie in segments (granges argument) with small minimum distance values (unlikely to be de novo).

**Usage**

```r
filterExperiment(object, granges, param)
```

---

**Arguments**
- `object`: A `MinDistExperiment`
- `granges`: A `GRanges`, `GRangesList`, or `MinDistGRanges` object
- `param`: a `MinDistParam` object

**Value**
a `MinDistExperiment`

---

**FilterParamMD**  
*Parameters for filtering results from the segmentation and copy number inference*

**Description**
A container for criteria used to filter the segmentation results post-hoc. Options including filtering on the posterior call, the posterior probability of the posterior call, the minimum number of markers spanned by the segment, the minimum width of the segment, and chromosome. Convenience functions are available for commonly used filters.

**Usage**

```r
FilterParamMD(state = trioStateNames(), seqnames = paste0("chr", 1:22), ...)
```
Arguments

- `state`: trio copy number states to select
- `seqnames`: chromosome names to select
- `...`: additional arguments passed to `FilterParam`

Examples

```r
library(VanillaICE)
data(md_gr)
data(md_exp)
mdparam <- MinDistParam()
fit <- MAP2(md_exp, md_gr, mdparam)
## return all segments
segs(fit)

## Default filters
param <- FilterParamMD()
param
cnvFilter(fit, param)

param2 <- FilterParamMD(seqnames="chr22", probability=0.9, numberFeatures=10)
cnvFilter(fit, param2)
denovoHemizygous(fit)
```

FilterParamMD-class  
A class for filtering genomic intervals called by MinimumDistance

Description

Options for filtering include the number of markers spanned by a segment, the posterior probability of the maximum a posteriori estimate of the trio copy number state, and the trio copy number state.

Usage

```r
## S4 method for signature 'FilterParamMD'
show(object)
```

Arguments

- `object`: a FilterParamMD object

See Also

denovo
### mad2

**Deprecated wrapper for computing the median absolute deviation of low-level summaries**

#### Description

Deprecated wrapper for computing the median absolute deviation of low-level summaries

#### Usage

```r
mad2(object, byrow = FALSE, ...)  # S4 method for signature 'list'
mad2(object, byrow, pedigree, ...)  # S4 method for signature 'TrioSetList'
mad2(object, byrow = FALSE, ...)  # S4 method for signature 'matrix'
mad2(object, byrow, pedigree, ...)  # S4 method for signature 'array'
```

#### Arguments

- **object**: see `showMethods("mad2")`
- **byrow**: logical if `TRUE`, compute the median absolute deviation of the rows of a matrix
- **...**: additional arguments to `mad`
- **pedigree**: an object of class `Pedigree`

### MAP

**Computes the maximum a posteriori trio copy number state for the segmented minimum distance**

#### Description

This function is deprecated and will be defunct in a future release. The replacement function is `MAP2`.

#### Usage

```r
MAP(object, ranges, id, TAUP = 1e+10, tauMAX = 1 - 5e-08, cnStates = c(-2, -0.4, 0, 0, 0.4, 1), pr.nonmendelian = 1.5e-06, mdThr = 0.9, ...)
```
Arguments

- **object**: see `showMethods(MAP)
- **ranges**: A `GRanges` object
- **id**: character string for sample identifier
- **TAUP**: scalar for transition probabilities
- **tauMAX**: the maximum probability that the current state is the same as the previous state
- **cnStates**: character vector for hidden Markov model state labels
- **pr.nonmendelian**: numeric: the a priori probability of a non-Mendelian copy number alteration
- **mdThr**: a length-one numeric vector. A minimum distance below this threshold in absolute value will not be evaluated for copy number alterations.
- **...**: Ignored.

MAP2

Computes maximum a posteriori estimate for the trio copy number state

Description

Computes maximum a posteriori estimate for the trio copy number state

Usage

```r
MAP2(object, mdgr, param = MinDistParam(), ...)
```

## S4 method for signature 'MinDistExperiment,MinDistGRanges'
```r
MAP2(object, mdgr, param = MinDistParam(), ...)
```

## S4 method for signature 'MinDistExperiment,GRangesList'
```r
MAP2(object, mdgr, param = MinDistParam(), ...)
```

## S4 method for signature 'MinDistExperiment,GRanges'
```r
MAP2(object, mdgr, param = MinDistParam(), ...)
```

Arguments

- **object**: An object of class `MinDistExperiment`
- **mdgr**: An object of class `MinDistGRanges, GRangesList, or GRanges`
- **param**: An object of class `MinDistParam`
- **...**: ignored

Value

An object of class `MinDistPosterior`
Examples

```r
library(oligoClasses)
library(VanillaICE)
## A MinDistExperiment object:
data(md_exp)
## Segmented data
data(md_gr)
e_param <- EmissionParam(temper=1, p_outlier=1/100)
param <- MinDistParam(thin=1L, emission=e_param)
## Not run:
md_g <- MAP2(md_exp, md_gr, param)
## End(Not run)
```

mdLegend

- **Text summary of information encapsulated in a MDRanges object for a particular interval**

Description

Text summary of information encapsulated in a MDRanges object for a particular interval

Usage

```r
mdLegend(g)
```

Arguments

- `g`: a MDRanges object

MDRanges-class

- **A GRanges-derived class**

Description

Contains maximum a posteriori estimates for each genomic interval

Usage

```r
MDRanges(..., posteriors)
```

Arguments

- `...`: additional arguments to GRanges constructor
- `posteriors`: a DataFrame

Examples

```r
MDRanges()
```
Description

This dataset contains log R ratios and B allele frequencies from a parent-offspring trio (three individuals). Only markers from chromosomes 7 and 22 are included in this object. The `MinDistExperiment` class extends `RangedSummarizedExperiment`, and so many of the methods defined for `RangedSummarizedExperiment` such as `findOverlaps` are available through inheritance.

Format

a `MinDistExperiment`

Examples

```r
## Not run:
library(oligoClasses)
library(VanillaICE)
library(data.table)
library(BSgenome.Hsapiens.UCSC.hg18)
extdir <- system.file("extdata", package="VanillaICE")
features <- suppressWarnings(fread(file.path(extdir, "SNP_info.csv")))
fgr <- GRanges(paste0("chr", features$Chr), IRanges(features$Position, width=1),
isSnp=features[["Intensity Only"]]==0)
fgr <- SnpGRanges(fgr)
names(fgr) <- features[["Name"]]
sl <- seqlevels(BSgenome.Hsapiens.UCSC.hg18)
seqlevels(fgr) <- sl[sl %in% seqlevels(fgr)]
seqinfo(fgr) <- seqinfo(BSgenome.Hsapiens.UCSC.hg18)[seqlevels(fgr),]
fgr <- sort(fgr)
files <- list.files(extdir, full.names=TRUE, recursive=TRUE, pattern="FinalReport")
## parse files
parsedDir <- "ParsedFiles"
if(!file.exists(parsedDir)) dir.create(parsedDir)
views <- ArrayViews(rowRanges=fgr, sourcePaths=files, parsedPath=parsedDir)
dat <- fread(files[1])
select_columns <- match(c("SNP Name", "Allele1 - AB", "Allele2 - AB",
"Log R Ratio", "B Allele Freq"), names(dat))
index_genome <- match(names(fgr), dat[["SNP Name"]])
scan_params <- CopyNumScanParams(index_genome=index_genome, select=select_columns,
cnvar="Log R Ratio",
bafvar="B Allele Freq",
gtvar=c("Allele1 - AB", "Allele2 - AB"))
invisible(sapply(views, parseSourceFile, param=scan_params))
ped_hapmap <- ParentOffspring(id = "hapmap", father="12287_03",
mother="12287_02",
offspring="12287_01",
parsedPath=parsedPath(views))
ped_list <- ParentOffspringList(pedigrees=list(
  ParentOffspring(id = "hapmap", father="12287_03",
mother="12287_02",
offspring="12287_01",
parsedPath=parsedPath(views))
))
```

md_gr

An example MinDistGRanges object

Description

Prior to inferring de novo trio copy number states, the log R ratios are segmented independently for each individual in a ParentOffspring class. The segmentation results are recorded in separate GRanges objects for the parents. For segmentation of the offspring log R ratios and the minimum distance, the segments are stored in separate GRangesList objects. For convenience, these GRanges, GRangesList, and pedigree information are bound in a single container referred to as a MinDistGRanges object. The example MinDistGRanges object provided in this package was obtained from the segmentation of the data stored in the example MinDistExperiment object.

Format

a MinDistGRanges object

mindist

Getter and setter for the minimum distance statistic

Description

Getter and setter for the minimum distance statistic

Usage

mindist(object)

mindist(object) <- value

Arguments

object see showMethods("mindist")
value a matrix of the minimum distance
MinDistExperiment-class

Constructor for MinDistExperiment class

Description

Constructor for MinDistExperiment class

Usage

MinDistExperiment(object = ArrayViews(), pedigree = ParentOffspring(), ...)

## S4 method for signature 'ArrayViews,ParentOffspring'
MinDistExperiment(object = ArrayViews(),
    pedigree = ParentOffspring(), ...)

Arguments

object see showMethods(MinDistExperiment)
pedigree a ParentOffspring object
...
ignored

Value

an object of class MinDistExperiment

MinDistExperiment-class

Class and methods for MinDistExperiment

Description

Class and methods for MinDistExperiment

Usage

## S4 method for signature 'MinDistExperiment'
show(object)

## S4 method for signature 'MinDistExperiment'
pedigree(object)

## S4 replacement method for signature 'MinDistExperiment'
pedigree(object) <- value

## S4 method for signature 'MinDistExperiment'
mindist(object)

## S4 replacement method for signature 'MinDistExperiment,ANY'
MinDistGRanges

mindist(object) <- value

## S4 method for signature 'MinDistExperiment,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'MinDistExperiment'
offspring(object)

## S4 method for signature 'MinDistExperiment'
father(object)

## S4 method for signature 'MinDistExperiment'
mother(object)

## S4 method for signature 'MinDistExperiment'
segment2(object, param = MinDistParam())

## S4 method for signature 'RangedSummarizedExperiment'
father(object)

## S4 method for signature 'RangedSummarizedExperiment'
mother(object)

## S4 method for signature 'RangedSummarizedExperiment'
offspring(object)

Arguments

object a MinDistExperiment object
value a ParentOffspring object
x a MinDistExperiment object
i a numeric-vector for indexing the rows (optional)
j a numeric-vector for indexing the columns (optional)
... additional arguments propagated to subsetting methods for RangedSummarizedExperiment
drop logical. Whether to simplify a one-row or one-column matrix to a vector. In most cases, this should always be FALSE.
param a MinDistParam object

Slots

mindist a matrix
pedigree a ParentOffspring object

---

MinDistGRanges Constructor for MinDistGRanges class
Description

The MinDistGRanges class contains the segmentation of the father, mother, offspring, and the minimum distance for each possible parent-offspring trio. For the parents, the segmentation results are expected to be in GRanges format. To accommodate multiple-offspring families, both the offspring segments and minimum distance segments should be of class GRangesList where the length of the list corresponds to the number of offspring.

Usage

MinDistGRanges(mindist = GRangesList(), offspring = GRangesList(),
               father = GRanges(), mother = GRanges(), pedigree = ParentOffspring())

Arguments

mindist a GRangesList object
offspring a GRangesList object
father a GRanges object
mother a GRanges object
pedigree a ParentOffspring object

Examples

MinDistGRanges()

MinDistGRanges-class  A container for storing segmentation data for members in a ParentOffspring family

Description

A container for storing segmentation data for members in a ParentOffspring family

Usage

## S4 method for signature 'MinDistGRanges'
names(x)

## S4 method for signature 'MinDistGRanges'
mindist(object)

## S4 replacement method for signature 'MinDistGRanges,GRangesList'
mindist(object) <- value

## S4 method for signature 'MinDistGRanges'
offspring(object)

## S4 method for signature 'MinDistGRanges'
mother(object)

## S4 method for signature 'MinDistGRanges'
MinDistParam

father(object)

## S4 method for signature 'MinDistGRanges'
pedigree(object)

## S4 method for signature 'MinDistGRanges'
show(object)

## S4 method for signature 'GRangesList'
offspring(object)

Arguments

x          a MinDistGRanges object
object     a MinDistGRanges object
value      a GRangesList object

Slots

mindist    a GRangesList object
offspring  a GRangesList object
father     a GRanges object
mother     a GRanges object
pedigree   a ParentOffspring object

Examples

data(md_gr)
offspring(md_gr)
father(md_gr)
mother(md_gr)
mindist(md_gr)

MinDistParam Constructor for MinDistParam class

Description

The MinDistParam class contains parameters used for the segmentation implemented in the DNAcopy package, parameters extracted from the PennCNV HMM such as parent-offspring transmission probabilities (see citation below), and initial values / parameters for computing emission probabilities.

Usage

MinDistParam(nMAD = 0.75, dnacopy = DNAcopyParam(), penncnv = PennParam(),
emission = EmissionParam(), thin = 10L)
MinDistParam-class

Class and methods for parameters of minimum distance algorithm

Description

Contains parameters used for circular binary segmentation (package DNAcopy), parameters in the PennCNV hidden Markov model, and parameters used for computing emission probabilities.

Usage

```r
## S4 method for signature 'MinDistParam'
nMAD(object)

## S4 replacement method for signature 'MinDistParam,numeric'
nMAD(object) <- value

## S4 method for signature 'MinDistParam'
show(object)

## S4 method for signature 'DNAcopyParam'
show(object)
```

Arguments

- `object`: a `MinDistParam` object
- `value`: a length-one numeric vector.

Arguments

- `nMAD`: a length-one numeric vector indicating the minimal number of median absolute deviations of the mean segmented minimum distance from zero. For non-zero segments (\# median absolute deviations > nMAD), maximum a posteriori estimates of the parent-offspring copy number states are computed. Segments with minimum distance values near zero are not called as they are less likely to correspond to regions with de novo copy number alterations.

- `dnacopy`: an object of class `DNAcopyParam`.

- `penncnv`: probabilities/parameters of the PennCNV hidden Markov model.

- `emission`: an object of class `EmissionParam`.

- `thin`: a length-one vector indicating whether to thin the data. This is primarily for internal use in conjunction with the `filterExperiment` function.

See Also

- `segment`
MinDistPosterior-class

Slots

- nMAD: a length-one numeric vector
- dnacopy: an object of class DNACopyParam
- penncnv: an object of class PennParam
- emission: an object of class EmissionParam
- thin: a length-one non-negative integer

MinDistPosterior-class

Container for the segmentation results from a MinDistExperiment

Description

MinDistPosterior is a GRangesList-derived container for the segmentation and maximum a posteriori trio copy number states.

Usage

## S4 method for signature 'MinDistPosterior,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'MinDistPosterior'
show(object)

Arguments

- x: a MinDistPosterior object
- i: an index for subsetting rows
- j: an index for subsetting columns
- ...: additional arguments passed to subsetting matrices
- drop: logical – whether to coerce single-row matrices to vectors
- object: a MinDistPosterior object

See Also

denovo

MinimumDistance

De novo copy number alterations in parent-offspring trios

Description

De novo copy number alterations in parent-offspring trios
nMAD

*Setter and getter for number of median absolute deviations the mean minimum distance of a genomic interval is from zero*

**Description**

Setter and getter for number of median absolute deviations the mean minimum distance of a genomic interval is from zero

**Usage**

```r
nMAD(object)

nMAD(object) <- value
```

**Arguments**

- `object`
  
  see `showMethods("nMAD")`

- `value`
  
  a length-one numeric vector

---

offspringNames

* Deprecated functions and methods *

**Description**

These functions will be defunct in a future release.

**Usage**

```r
offspringNames(object)

offspringNames(object) <- value

trios(object)

pedigree(object)

pedigree(object) <- value
```

**Arguments**

- `object`
  
  see `showMethods("offspringNames")`

- `value`
  
  a character vector of offspring identifiers
ParentOffspring-class

Object containing the sample identifiers for members in a pedigree

Description

Container for registering sample identifiers with membership in a pedigree. For representing multiple pedigrees, see ParentOffspringList.

Accessor for the sample identifiers for the members in a pedigree

Constructor for ParentOffspring class

Usage

```r
offspring(object)
mother(object)
father(object)
```

```r
ParentOffspring(id = character(), father = character(),
    mother = character(), offspring = character(), parsedPath = character())
```

```r
## S4 method for signature 'ParentOffspring'
pedigreeName(object)

## S4 method for signature 'ParentOffspring'
father(object)

## S4 method for signature 'ParentOffspring'
mother(object)

## S4 method for signature 'ParentOffspring'
offspring(object)

## S4 method for signature 'ParentOffspring'
show(object)

## S4 method for signature 'ParentOffspring'
names(x)
```

Arguments

```r
object a ParentOffspring object
id length-one character vector providing a family-level id
father length-one character vector providing sample ids for father
mother length-one character vector providing sample ids for mother
offspring character vector providing sample ids for offspring (can have length greater than
    one if there is more than one offspring)
parsedPath character vector providing path to low-level data
x a ParentOffspring object
```
Slots

- **id** length-one character vector providing a family-level id
- **father** length-one character vector providing sample ids for father
- **mother** length-one character vector providing sample ids for mother
- **offspring** character vector providing sample ids for offspring (can have length greater than one if there is more than one offspring)
- **parsedPath** character vector providing path to parsed files of the marker-level summaries

See Also

ParentOffspringList-class

Examples

ParentOffspring()

Description

Each element of the list is an element of class ParentOffspring.

Constructor for ParentOffspringList class

Usage

ParentOffspringList(pedigrees = list(), id)

## S4 method for signature 'ParentOffspringList'
pedigreeName(object)

## S4 method for signature 'ParentOffspringList'
show(object)

## S4 method for signature 'ParentOffspringList,ANY,ANY'
x[[i, j, ..., drop = FALSE]]

## S4 method for signature 'ParentOffspringList,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'ParentOffspringList'
length(x)
Arguments

- **pedigrees**: a list of `ParentOffspring` objects
- **id**: identifier for a pedigree
- **object**: a `ParentOffspringList` object
- **x**: a `ParentOffspringList` object
- **i**: a numeric vector for subsetting the list (optional)
- **j**: ignored
- **...**: ignored
- **drop**: ignored

Slots

- **id**: a character vector of identifiers for the pedigrees. `id` must have the same length as `pedigrees`.
- **pedigrees**: A list of `ParentOffspring` objects.

Examples

```
ParentOffspringList()
```

---

**Pedigree**

*Deprecated function for constructing an instance of class Pedigree*

Description

This function is deprecated and will be removed in a future release.

Usage

```
Pedigree(pedigreeInfo, fatherIds = character(), motherIds = character(), offspringIds = character())
```

Arguments

- **pedigreeInfo**: a `data.frame` with column names 'F' (father), 'M' (mother), and 'O' (offspring). Elements of the `data.frame` are the sample names.
- **fatherIds**: character vector of identifiers for the father
- **motherIds**: character vector of identifiers for the mother
- **offspringIds**: character vector of identifiers for the offspring

Examples

```
Pedigree()
```
Pedigree-class

Deprecated class for storing pedigree data

Description

Deprecated class for storing pedigree data

Usage

```r
## S4 method for signature 'Pedigree'
trios(object)
```

```r
## S4 method for signature 'Pedigree'
offspringNames(object)
```

```r
## S4 method for signature 'Pedigree'
show(object)
```

```r
## S4 method for signature 'Pedigree,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]
```

```r
## S4 method for signature 'Pedigree'
dim(x)
```

Arguments

- `object` a Pedigree object
- `x` a Pedigree object
- `i` a numeric vector for subsetting (optional)
- `j` ignored
- `...` ignored
- `drop` ignored

Slots

- `trios` a `data.frame` with colnames 'F', 'M', and 'O' containing sample identifiers for the father (F), mother (M), and offspring (O).
- `trioIndex` a `data.frame`

pedigreeGrid

Plot the log R ratios and BAFs on a grid given by precomputed viewports

Description

Plot the log R ratios and BAFs on a grid given by precomputed viewports
pedigreeName

Usage

pedigreeGrid(g, vps, figs)

Arguments

g  a MDRanges object

vps  a list of viewports. See pedigreeViewports.

figs  a list of trellis objects created by the function plotDenovo.

See Also

plotDenovo pedigreeViewports

Examples

library(VanillaICE)
require(grid)
## marker-level summaries
data(md_exp)
seqlevels(md_exp, force=TRUE) <- "chr22"
## segmentation results
data(md_gr)
posteriorCalls <- MAP2(md_exp, md_gr, MinDistParam())
g <- denovoHemizygous(posteriorCalls)
g
vps <- MinimumDistance:::pedigreeViewports()
param <- HmmTrellisParam()
p <- plotDenovo(md_exp, g[1], param)
leg <- mdLegend(g[1])
upViewport(0)
pushViewport(vps["legend"])
grid.text(leg, x=unit(0.02, "npc"), y=unit(0.95, "npc"), just=c("left", "top"), gp=gpar(cex=0.6, fontfamily="mono"))

## combine adjacent denovo hemizygous

##
g2 <- reduce(denovoHemizygous(posteriorCalls), min.gapwidth=500e3)
post <- MAP2(md_exp, g2)
g2 <- denovoHemizygous(post)
p <- plotDenovo(md_exp, g2, param)
p <- pedigreeGrid(g=g2, vps=vps, figs=p)
leg <- mdLegend(g2)
upViewport(0)
pushViewport(vps["legend"])
grid.text(leg, x=unit(0.02, "npc"), y=unit(0.95, "npc"), just=c("left", "top"), gp=gpar(cex=0.6, fontfamily="mono"))
Usage
pedigreeName(object)

Arguments
object a ParentOffspring or ParentOffspringList object

See Also
ParentOffspring ParentOffspringList

pedigreeViewports Default viewports for plotting log R ratios, BAFs, chromosome idiogram, and a legend for a case-parent trio

Description
Default viewports for plotting log R ratios, BAFs, chromosome idiogram, and a legend for a case-parent trio

Usage
pedigreeViewports()

See Also
plotDenovo pedigreeGrid

Examples
vps <- pedigreeViewports()

PennParam Constructor for class PennParam

Description
Parameters for the PennCNV Hidden Markov model

Usage
PennParam(states, referenceState = "222", prLessLikelyCN = 9e-04, prNonMendelian = 1.5e-06, prInitialStateNotDiploid = 4/5, prTransitionToNewState = 0.5, tauNM = 0.01)

### S4 method for signature 'PennParam'
show(object)
Arguments

- states: character vector of possible trio states
- referenceState: the reference (normal) trio copy number state (typically '222')
- prLessLikelyCN: as defined in Wang et al. 2007, this is the probability of the less likely allele-specific copy numbers for the trio
- prNonMendelian: the prior probability of a non-Mendelian copy number alteration
- prInitialStateNotDiploid: initial probability for non-diploid states
- prTransitionToNewState: probability of transitioning to a new state
- tauNM: probability of transitioning from a Mendelian given previous event was non-Mendelian (and vice versa).
- object: a PennParam object

References

Wang et al., Genome Res. 2007 Nov;17(11):1665-74. PMID: 17921354

Description

Plot marker-level summaries for a genomic interval of interest

Usage

plotDenovo(object, g, param)

# S4 method for signature 'MinDistExperiment,MDRanges'
plotDenovo(object, g, param)

Arguments

- object: see showMethods("plotDenovo")
- g: a MDRanges object
- param: a HmmTrellisParam object
range,ILimit-method  

**compute the range of an ILimit instance**

---

**Description**

The range method for class ILimit is used internally in MinimumDistance.

**Usage**

```r
## S4 method for signature 'ILimit'
range(x, ..., na.rm = FALSE)
```

**Arguments**

- `x`  
  a ILimit object
- `...`  
  ignored
- `na.rm`  
  logical. If TRUE, missing values are removed.

---

**segment2**  

*A wrapper for DNAcopy’s segment function*

---

**Description**

Methods for circular binary segmentation.

**Usage**

```r
segment2(object, ...)
```

```r
## S4 method for signature 'TrioSet'
segment2(object, md = NULL, segmentParents = TRUE, verbose = TRUE, ...)
```

```r
## S4 method for signature 'matrix'
segment2(object, pos, chrom, id, featureNames, ...)
```

```r
## S4 method for signature 'ff_matrix'
segment2(object, pos, chrom, id, featureNames, ...)
```

```r
## S4 method for signature 'arrayORff_array'
segment2(object, pos, chrom, id, featureNames, segmentParents = TRUE, verbose = TRUE, ...)
```
TrioSet

Arguments

object see showMethods(segment2)

... Additional arguments passed to DNAcopy's segment.

md a matrix of the minimum distance

segmentParents logical. Whether to segment the log R ratios of the parents using circular binary segmentation.

verbose logical. Whether to display messages that indicate progress.

pos integer vector of physical position of markers in the genome

chrom character or integer vector of chromosome names

id character vector of trio identifiers for subsetting object

featureNames character vector specifying marker names for subsetting object

See Also

segment

segment

TrioSet

Deprecated constructor for TrioSet class

Description

The TrioSet class has been deprecated and may be removed in a future release.

Usage

TrioSet(pedigreeData = Pedigree(), sample.sheet, row.names = NULL, lrr, baf,
featureData, cdfname, drop = TRUE, mindist = NULL, genome = c("hg19",
"hg18"))

Arguments

pedigreeData an object of class Pedigree

sample.sheet a data.frame containing metadata on the trios

row.names a character vector providing row identifiers for the sample.sheet argument that match the names of the trios in the pedigreeData argument.

lrr a matrix of log R ratios

baf a matrix of B allele frequencies

featureData a GenomeAnnotatedDataFrame object for the SNPs/nonpolymorphic markers

cdfname character string indicating the annotation package used to extract physical position and chromosome of markers

drop logical. When FALSE, the dimnames on the log R ratio and BAF arrays is set to NULL

mindist can be either NULL or a matrix of the minimum distance

genome character string providing the UCSC genome build
TrioSet-class

Value

TrioSet

Examples

path <- system.file("extdata", package="MinimumDistance")
load(file.path(path, "logRratio.rda"))
load(file.path(path, "baf.rda"))
load(file.path(path, "pedigreeInfo.rda"))
trioSet <- TrioSet(lrr=logRratio,
                   baf=baf,
                   pedigree=Pedigree(pedigreeInfo),
                   cdfname="human610quadv1bCrlmm",
                   genome="hg18")

TrioSet-class

Deprecated class for storing low-level genomic data for trios

Description

This class is deprecated and will be defunct in a future release.

Usage

## S4 method for signature 'TrioSet'
pedigree(object)

## S4 method for signature 'TrioSet'
show(object)

## S4 method for signature 'TrioSet'
mindist(object)

## S4 replacement method for signature 'TrioSet,matrix'
mindist(object) <- value

## S4 method for signature 'TrioSet'
dim(x)

## S4 method for signature 'TrioSet'
trios(object)

## S4 method for signature 'TrioSet,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'TrioSet,GRanges'
MAP(object, ranges,
     transition_param = TransitionParam(), emission_param = EmissionParam(),
     mdThr = 0.9, ...)

## S4 method for signature 'ff_array,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]
**Arguments**

object
a TrioSet object

value
a matrix

x
a TrioSet object

i
a numeric vector for subsetting rows (optional)

j
a numeric vector for subsetting trios (optional)

... additional arguments passed to subsetting methods for matrices and data frames

drop
logical. Whether to simplify matrices to numeric vectors. This should be left as FALSE.

ranges
a GRanges object

transition_param
an object of class TransitionParam

emission_param
an object of class EmissionParam

mdThr
the minimum absolute value of the minimum distance segment mean. Segments with means below mdThr in absolute value will not be called as they are unlikely to be de novo.

**Slots**

fatherPhenoData AnnotatedDataFrame containing covariates for the father

motherPhenoData AnnotatedDataFrame containing covariates for the mother

pedigree an object of class Pedigree

mindist a numeric matrix of the minimum distance for each trio, or NULL

---

**TrioSetList**

*Constructor for TrioSetList class*

**Description**

The TrioSetList class has been deprecated and may be removed in a future release. Use MinDistExperiment instead.

**Usage**

TrioSetList(chromosome = integer(), pedigreeData = Pedigree(), sample.sheet, row.names = NULL, lrr, baf, featureData, cdfname, ffname = "", genome)

**Arguments**

chromosome integer vector of chromosome names

pedigreeData a Pedigree object

sample.sheet a data.frame containing sample covariates

row.names a character vector

lrr a matrix of log R ratios

baf a matrix of B allele frequencies
**TrioSetList-class**

This class is deprecated and will be defunct in a future release.

**Description**

This class is deprecated and will be defunct in a future release.

**Usage**

```r
## S4 method for signature 'TrioSetList,RangedSummarizedExperiment'
coerce(from, to)

## S4 method for signature 'TrioSetList'
pedigree(object)

## S4 method for signature 'TrioSetList'
trios(object)

## S4 method for signature 'TrioSetList'
offspringNames(object)

## S4 method for signature 'TrioSetList,ANY,ANY,ANY'
x[i, j, ..., drop = FALSE]

## S4 method for signature 'TrioSetList,ANY,ANY'
x[[i, j, ..., exact = TRUE]]

## S4 method for signature 'TrioSetList'
show(object)

## S4 method for signature 'TrioSetList'
length(x)

## S4 method for signature 'TrioSetList'
x$name

## S4 method for signature 'TrioSetList,GRanges'
MAP(object, ranges, id, TAUP = 1e+10,
    tauMAX = 1 - 5e-08, cnStates = c(-2, -0.4, 0, 0, 0.4, 1),
    pr.nonmendelian = 1.5e-06, mdThr = 0.9, ...)

## S4 method for signature 'TrioSetList'
segment2(object, md = NULL, segmentParents = TRUE,
    verbose = TRUE, ...)
```
TrioSetList-class

## S4 method for signature 'list'
segment2(object, pos, chrom, id = NULL, featureNames,
  segmentParents = TRUE, verbose = TRUE, genome, ...)

Arguments

from a TrioSetList
to a RangedSummarizedExperiment
object a TrioSetList object
x a TrioSetList
i a numeric vector for subsetting the chromosomes (optional)
j a numeric vector for subsetting trios (optional)
... additional arguments passed to subsetting methods for matrices and data frames
drop logical. Whether to simplify matrices to numeric vectors. This should be left as FALSE.
exact ignored
name character string of a variable name in the phenoData
ranges a GRanges object
id a character vector of trio identifiers
TAUP length-one numeric vector. Larger values decrease the probability of transitioning to an different state.
tauMAX the maximum allowed transition probability
cnStates a length-six numeric vector providing initial values for the mean copy number for each of the 6 states
pr.nonmendelian a length-one numeric vector indicating the probability of a non-Mendelian copy number alteration in the offspring
mdThr a length-one numeric vector indicating the minimum value of the mean minimum distance. Segments with absolute mean value less than mdThr are not called.
md a list of minimum distance matrices. Length of list should be the same as the length of the TrioSetList object.
segmentParents logical. Whether to segment the parental log R ratios.
verbose logical. Whether to display messages indicating progress.
pos a list of the genomic positions (integers)
chrom list of chromosome names
featureNames a list of the marker names
genome a character vector indicating the UCSC genome build used for the annotation (i.e., 'hg18' or 'hg19').

Slots

fatherPhenoData AnnotatedDataFrame containing covariates for the father
motherPhenoData AnnotatedDataFrame containing covariates for the mother
pedigree an object of class Pedigree
TrioSetListLD

**Deprecated TrioSetList constructor for large data**

**Description**

The TrioSetListLD constructor uses ff objects to handle large datasets. This function is defunct. Use MinDistExperiment instead.

**Usage**

```r
TrioSetListLD(path, fnames, ext = "", samplesheet, row.names, pedigreeData,
featureData, annotationPkg, outdir = ldPath(), ffprefix = "",
genome = c("hg19", "hg18"))
```

**Arguments**

- `path` Path to plain-text files containing log R ratios and B allele frequencies. Files should contain data for a single sample.
- `fnames` Character string providing filenames.
- `ext` Character string indicating whether the `fnames` has a file extension (e.g., ".txt")
- `samplesheet` (Optional) data.frame containing phenotypic / experimental covariates on the samples. Note that if `samplesheet` is provided, `row.names` must be specified.
- `row.names` Character vector indicating the sample id for each row in `samplesheet`. `row.names` should be unique and, ideally, correspond to `fnames`
- `pedigreeData` An object of class Pedigree.
- `featureData` A GenomeAnnotatedDataFrame
- `annotationPkg` Character string indicating the annotation package used to extract information on the features (chromosome, physical position, and whether the feature is polymorphic (isSnp)).
- `outdir` Character string indicating the path for storing ff objects. Ignored if the ff package is not loaded.
- `ffprefix` Character string indicating the prefix used to name ff objects. Ignored if the ff package is not loaded.
- `genome` character string indicating UCSC genome build. Only "hg19" is allowed for annotation packages that support a single build. Supported builds for most platforms are "hg18" and "hg19".

**Value**

A TrioSetList object

**See Also**

TrioSetList
