# Package ‘PICS’

January 15, 2017

**Type** Package  
**Title** Probabilistic inference of ChIP-seq  
**Version** 2.18.0  
**Author** Xuekui Zhang <xzhang@stat.ubc.ca>, Raphael Gottardo  
<rgottard@fhcrc.org>  
**Maintainer** Renan Sauteraud <rsautera@fhcrc.org>  
**Depends** R (>= 2.14.0), BiocGenerics (>= 0.1.3)  
**Imports** methods, stats4, IRanges, GenomicRanges, graphics, grDevices, stats, Rsamtools, GenomicAlignments, S4Vectors  
**Suggests** ShortRead, rtracklayer, parallel  
**SystemRequirements** GSL (GNU Scientific Library)  
**Description** Probabilistic inference of ChIP-Seq using an empirical Bayes mixture model approach.  
**License** Artistic-2.0  
**biocViews** Clustering, Visualization, Sequencing, ChIPSeq  
**NeedsCompilation** yes

bam2gr

Description

Reads a bam file using Rsamtools and extract the reads for each chromosome.

Usage

bam2gr(bamFile, chr=NULL, PE=FALSE, verbose=FALSE)

Arguments

bamFile A character string, the name of the .bam file to read.
chr An optional character string. If specified, only the selected chromosome will be returned. Speed up the computation.
PE A logical. This should be set to TRUE for paired-end sequencing data.
verbose A logical. Print additional information about the data.

Value

Returns a GRanges of all the reads for each chromosome.

Note

The user might encounter a memory allocation error when using bam files of bigger sizes. Splitting the file by chromosome before calling bam2gr will solve this issue.

For Paired-End data, non matched reads are discarded.

Author(s)

Renan Sauteraud

segmentPICS
makeRangedDataOutput

Create a RangedData object from a PICS output

Description

Create a list of ‘RangedData’ objects from a ‘pics’ object. The resulting RangedData object can then be analyzed with the ‘IRanges’ packages and/or exported to bed/wig files with the ‘rtracklayer’ package.

Usage

makeRangedDataOutput(obj, type="fixed", filter=list(delta=c(0,Inf),se=c(0,Inf),sigmaSqF=c(0,Inf),sigmaSqR=c(0,Inf)),length=100)

Arguments

obj
An object of class 'picsList' as returned by 'PICS' when running it on the IP/Control data.

type
The type of intervals to be created. The different types are ‘bed’, ‘wig’, ‘ci’ and ‘fixed’. See details for more info.

filter
A list of filters to be used before computing the FDR. By default all regions are included, see details for more info on how to specify the filters.

length
The length to be used for the fixed type ‘RangedData’, see details.

Details

‘bed’ will generate intervals from the forward peak max to the reverse peak max. ‘wig’ will generate a density profile for the forward and reverse reads. ‘bed’ and ‘wig’ types should be used to be exported to wig/bed files to be used with the UCSC genome browser. ‘ci’ corresponds to the binding site estimates +/-3*se, while ‘fixed’ corresponds to the binding site estimates +/-3*length. ‘bed’ and ‘wig’ files can be exported using the ‘export’ function for the ‘rtracklayer’ package.

Value

An object of type ‘RangedData’.

### Estimation of binding site positions

#### Description

This object contains Estimation of binding site positions and has the following slots: segReadsList, dataType.

#### Usage

```r
PICS(segReadsList,dataType=NULL, paraEM=NULL, paraPrior=NULL, nCores=1)
```

#### Arguments

- `segReadsList`: This object contains segmentation of Genome
- `dataType`: The type of data you are processing: specified ‘TF’ for transcription factor.
- `paraEM`: A list of parameters for the EM algorithm as returned by the `setParaEm` function. The default parameters should be good enough for most usages.
  - `minK`: an integer, default=1. The minimum number of binding events per region. If the value is 0, the minimum number is automatically calculated.
  - `maxK`: an integer, default=15. The maximum number of binding events per region. If the value is 0, the maximum number is automatically calculated.
  - `tol`: a numeric, default=1e-4. The tolerance for the EM algorithm.
  - `B`: an integer, default=100. The maximum number of iterations to be used.
  - `mSelect`: a character string specifying the information criteria to be used when selecting the number of binding events. Default="BIC"
  - `mergePeaks`: a logical stating whether overlapping binding events should be picked. Default=TRUE
  - `mapCorrect`: a logical stating whether mappability profiles should be incorporated in the estimation, i.e: missing reads estimated. Default=TRUE
- `paraPrior`: A list of parameters for the prior distribution as returned by the `setParaPrior` function. The default parameters should be good enough for most usages.
  - `xi`: an integer, default=200. The average DNA fragment size.
  - `rho`: an integer, default=1. A variance parameter for the average DNA fragment size distribution.
  - `alpha`: an integer, default=20. First hyperparameter of the inverse Gamma distribution for sigma^2 in the PICS model.
beta: an integer, default=40000. Second hyperparameter of the inverse
Gamma distribution for sigma^2 in the PING model
lambda: an integer, default=0. The precision of the prior for mu used for
histone data.
dMu: an integer, default=0. Our best guess for the distance between two
neighboring nucleosomes.
nCores An integer. The number of cores that should be used in parallel by the func-
tion.

Methods

code signature(x = `\'pics\'\'): return the error code for each list element (i.e. candidate region)
of a PICS object. If the string is empty, there were no errors.
plot signature(x = `\'pics\'\'): Plot all regions in the PICS object. This might be long, and
should only be used to plot a few regions, so subset the object before plotting.
sigmaSqR signature(x = `\'pics\'\'): return the variance parameter of the reverse (R) distribu-
tion for each binding event.
sigmaSqF signature(x = `\'pics\'\'): return the variance parameter of the forward (F) distribu-
tion for each binding event.
score signature(x = `\'pics\'\'): return the score for each binding event.
scoreF signature(x = `\'pics\'\'): return the score of the forward (F) for each binding event.
scoreR signature(x = `\'pics\'\'): return the score of the forward (R) for each binding event.
maxRange signature(x = `\'pics\'\'): return the range maximum.
minRange signature(x = `\'pics\'\'): return the range minimal.
K signature(x = `\'pics\'\'): subset PICS object.
wigDensity signature(x = `\'pics\'\'): return the density for each binding event.

pics
The pics class

Description

This object is used to gather all parameters from fitting PICS to a single candidate region. The object contains the following slots: ‘estimates’, ‘infMat’, ‘Nmerged’, ‘converge’, ‘chr’. ‘estimates’ is a list containing all parameters estimates as well as standard errors. ‘infMat’ is the Cholesky decomposition of the information matrix, ‘converge’ is a logical value indicating whether the EM algorithm has converged, while ‘chr’ is a character string corresponding to a candidate region’s chromosome. ‘Nmerged’ gives the number of binding events that were merged; binding events that overlap are merged (see the cited paper below for details).

Accessors

The PICS package provide accessors to directly access to most of the parameters/standard errors and chromosome. In the code snippets below, ‘x’ is a ‘pics’ object.

‘chromosome(x)’ Gets the chromosome name of the candidate region.
‘mu(x)’ Gets the position estimates of all binding sites identified in the region.
‘delta(x)’ Gets the average fragment lengths of all binding sites identified in the region.
‘sigmaSqF(x)’ Gets the F peak variances of all binding sites identified in the region.
‘sigmaSqR(x)’ Gets the R peak variances of all binding sites identified in the region.
‘seF(x)’ Gets the standard errors of all binding site position estimates identified in the region.
‘seR(x)’ Gets the standard errors of all F peak modes identified in the region.
‘score’ signature(x = "pics"); return the score for each binding event.
‘scoreF’ signature(x = "pics"); return the score of the forward (F) for each binding event.
‘scoreR’ signature(x = "pics"); return the score of the forward (R) for each binding event.

Constructor

newPics(w,mu,delta,sigmaSqF,sigmaSqR,seMu,seMuF,seMuR,score,Nmerged,converge,infMat,chr)
construct a new ‘pics’ object with the following arguments:

  w   The mixture weights (a vector)
  mu  The binding site positions (a vector)
  delta The DNA fragment lengths (a vector)
  sigmaSqF The variance parameters for the forward distribution (vector)
  sigmaSqR The variance parameters for the forward distribution (vector)
  seMu The standard errors for mu (vector)
  seMuF The standard errors for muF (vector)
  seMuR The standard errors for muR (vector)
  score The scores for each binding event (vector)
  Nmerged The number of peaks that got merged (integer)
  converge A logical value, TRUE, if the EM as converged
  infMat The information matrix
  chr The chromosome for the region
Author(s)

Examples
# Here is an example of how to construct such a region.
# Typically, you would not do this manually, you would use the pics function to return a 'picsList' that contains
w<-1
mu<-10000
delta<-150
sigmaSqF<-5000
sigmaSqR<-5000
seMu<10
seMuF<-10
seMuR<-10
score<-5
Nmerged<-0
converge<TRUE
chr<“chr1”
range<-(1000,2000)
# Constructor
#myPICS<-newPics(w,mu,delta,sigmaSqF,sigmaSqR,seMu,seMuF,seMuR,score,Nmerged,as.integer(range),chr)

---

The pics class

Description
This object is used to return an error code when the PICS function failed to return a valid set of estimates for a candidate regions. This could be due to non-convergence of the EM algorithm, a singular information matrix, or a number of reads below the limit specified by the user. All of these are typically due to too few reads in the region and do not affect the rest of the analysis, as such regions would most likely be labelled as false positives.

Accessors
All of the accessors defined for a ‘pics’ object still work for a ‘picsError’ object but will simply return a NULL pointer.

Constructor
newPicsError(string) where ‘string’ is the error code.
Constructor

```r
newPicsError<-function(string)
  string  The mixture weights (a vector)
```

Author(s)

Xuekui Zhang, Arnaud Droit <<arnaud.droit@crchuq.ualaval.ca>> and Raphael Gottardo <<rgottard@fhcrc.org>>

Examples

```r
# Here is an example on how to construct such a picsError object
# Typically, you would not do this manually, you would use the pics function to return a 'picsList' that contain
# Constructor
myPicsError<-newPicsError("Singular information matrix")
# Accessors
# Get the standard error of Mu
se(myPicsError)
# Get the standard error of MuF
seF(myPicsError)
# Get the scores
score(myPicsError)
```

**Description**

Estimate the false detection rate for an object of class `pics` or `picsList`.

**Usage**

```r
picsFDR(picsIP,picsCont,filter=list(delta=c(0,Inf),se=c(0,Inf),sigmaSqF=c(0,Inf),sigmaSqR=c(0,Inf)))
```

**Arguments**

- `picsIP`: An object of class `pics` or `picsList` containing the informations for the IP reads.
- `picsCont`: An object of class `pics` or `picsList` containing the informations for the control reads.
- `filter`: filter A list of ranges for filtering regions based on PICS parameters. By default filter is set to 'NULL' and all regions are used.
  - `delta`: Length of the binding sites.
`picsList-class`

`se`  Standard error.

`sigmaSqF`  Forward peak variance

`sigmaSqR`  Reverse peak variance

**Value**

A 3 columns data frame with the following columns: FDR, score, N.

**Author(s)**

Xuekui Zhang

**See Also**

`picsList`  `pics`

---

**Description**

This object is used to gather all parameters from fitting PICS to multiple candidate regions (as returned by the ‘segmentReads’ function). The object contains the following slots: ‘List’, ‘paraPrior’, ‘paraEM’, ‘minReads’, ‘N’, ‘Nc’. ‘List’ is a list of ‘pics’ or ‘picsError’ objects. ‘paraPrior’ is a list containing the hyperparameters used for the prior, ‘paraEM’ is a list of convergence parameters for the EM, ‘minReads’ is a list containing the minimum number of reads used to fit a region with ‘PICS’, ‘N’ is the total number of reads in the ChIP samples while ‘Nc’ is the total number of reads in the control sample.

**Arguments**

- **object**
  An object of class `pics`.

**Accessors**

The PICS package provide accessors to directly access to most of the parameters/standard errors and chromosomes. In the code snippets below, ‘x’ is a ‘picsList’ object. For all accessors, the ‘picsError’ objects are omitted, so that the accessors only return values for the ‘pics’ objects (i.e. all valid binding events).

- **’chromosome(x)’**  Gets the chromosome names of all candidate regions.
- **’mu(x)’**  Gets the position estimates of all binding sites identified in all candidate regions.
- **’delta(x)’**  Gets the average fragment lengths of all binding sites identified in all candidate regions.
- **’sigmaSqF(x)’**  Gets the F peak variances of all binding sites identified in all candidate regions.
- **’sigmaSqR(x)’**  Gets the R peak variances of all binding sites identified in all candidate regions.
- **’seF(x)’**  Gets the standard errors of all binding site position estimates identified in all candidate regions.
- **’seF(x)’**  Gets the standard errors of all F peak modes identified in all candidate regions.
- **’seR(x)’**  Gets the standard errors of all R peak modes identified in all candidate regions.
- **’score(x)’**  Gets the scores of all binding events identified in all candidate regions.
Constructor

newPicsList(List, paraEM, paraPrior, minReads, N, Nc) constructs a new 'picsList' object with the following arguments.

**List** The mixture weights (a vector)

**paraEM** The binding site positions (a vector)

**paraPrior** The DNA fragment lengths (a vector)

**N** The variance parameters for the forward distribution (vector)

**Nc** The variance parameters for the forward distribution (vector)

Methods

\[ \text{signature}(x = "\text{'pics'}") : \text{subset PICS object.} \]

Methods

\[ \text{length} \text{ \text{signature}(x = "\text{'pics'}") : \text{subset PICS object.} \]

Constructor

newPicsList<-function(List, paraEM, paraPrior, minReads, N, Nc) constructs a new 'picsList' object with the following arguments.

**newPicsList**

**w** The mixture weights (a vector)

**mu** The binding site positions (a vector)

**delta** The DNA fragment lengths (a vector)

**sigmaSqF** The variance parameters for the forward distribution (vector)

**sigmaSqR** The variance parameters for the reverse distribution (vector)

**seMu** The standard errors for mu (vector)

**seMuF** The standard errors for muF (vector)

**seMuR** The standard errors for muR (vector)

**score** The scores for each binding event (vector)

**Nmerged** The number of peaks that were merged (integer)

**converge** A logical value, TRUE, if the EM as converged

**infMat** The information matrix

**chr** The chromosome for the region

---

**plot-FDR**

**FDR plot for PICS**

**Description**

This method plots an FDR curve showing the FDR as a function of the PICS scores.

**Usage**

```r
## S4 method for signature 'picsList,picsList'
plot(x, y, filter=NULL, h=.1, ...)
```
Arguments

- **x**: A `picsList` object as returned by the function `PICS` run on the treatment data.
- **y**: A `picsList` object as returned by the function `PICS` run on the control data.
- **filter**: A list of ranges for filtering regions based on `PICS` parameters. By default, `filter` is set to 'NULL' and all regions are used.
- **h**: A value between 0 and 1, representing the desired FDR. This simply draws a horizontal line at the given value.
- **...**: Further graphical parameters passed to the generic function `plot`.

`PICS`

Description

These two functions are part of the segmentation step for paired-end sequencing data and are exported to be used in PING package.

segmentPICS

Segment the genome into candidate regions

Description

Pre-process bidirectional aligned reads data from a single ChIP-Seq experiment to detect candidate regions with a minimum number of forward and reverse reads. These candidate regions will then be processed by PICS.

Usage

```r
segmentPICS(data, dataC=NULL, map=NULL, minReads=2, minReadsInRegion=3, jitter=FALSE, dataType="TF", maxLregion=0, minLregion=100)
```
Arguments

data A linkS4class(GRanges) object containing the IP reads. See details for more information on how to set up the data.

dataC A linkS4class(GRanges) object containing the control reads. Set to NULL by default, i.e. no control.

map A ‘RangedData’ object containing the mappability profiles. Set to NULL by default, i.e. no profiles.

minReads The minimum number of F/R reads to be present in the sliding window.

minReadsInRegion The minimum number of F/R reads to be present in the region.

jitter A logical value stating whether some noise should be added to the read locations. This is recommended if the read positions have lots of duplicates.

dataType Type of experiment. "TF" or "H".

maxLregion The maximum length.

minLregion The minimum length.

Value

An object of class segReadsList containing the results for all regions pre-processed.

segReadsPE segReadsList

segReadsPE Class to store post-segmentation result

Description

This class stores the information of the segmentation performed by segmentPING. It is used as the input of the PING function.

Extends

Class segReadsList, directly.

Author(s)

Xuekui Zhang
setParaEM

Function that returns a list of parameters for the EM algorithm that can be used as an argument of PICS.

Description
This function takes from 0 to 7 EM algorithm parameters as argument, check if they are valid and returns a list to be used in a call to PICS.

Usage
```
setParaEM(minK=1, maxK=15, tol=1e-4, B=100, mSelect="BIC", mergePeaks=TRUE, mapCorrect=TRUE, dataType=NULL)
```

Arguments
- **minK**: An integer. The minimum number of binding events per region. If the value is 0, the minimum number is automatically calculated.
- **maxK**: An integer. The maximum number of binding events per region. If the value is 0, the maximum number is automatically calculated.
- **tol**: A numeric. The tolerance for the EM algorithm.
- **B**: An integer. The maximum number of iterations to be used.
- **mSelect**: A character string specifying the information criteria to be used when selecting the number of binding events.
- **mergePeaks**: A logical stating whether overlapping binding events should be picked.
- **mapCorrect**: A logical stating whether mappability profiles should be incorporated in the estimation, i.e: missing reads estimated.
- **dataType**: A character. If a dataType is set, the algorithm will use the default parameters for this type of data (all the previous arguments will be ignored).

Value
Returns a list of parameters to be used in PICS.

Author(s)
Renan Sauteraud

See Also
- PICS
**setParaPrior**

*Function that returns a list of parameters that can be used as an argument of PICS.*

**Description**

This function takes from 0 to 6 parameters as argument, check if they are valid and returns a list to be used in a call to PICS.

**Usage**

```r
setParaPrior(xi=200, rho=1, alpha=20, beta=40000, lambda=0, dMu=0, dataType=NULL, PExi=0)
```

**Arguments**

- **xi**
  - An integer. The average DNA fragment size.
- **rho**
  - An integer. A variance parameter for the average DNA fragment size distribution.
- **alpha**
  - An integer. First hyperparameter of the inverse Gamma distribution for \( \sigma^2 \) in the PICS model
- **beta**
  - An integer. Second hyperparameter of the inverse Gamma distribution for \( \sigma^2 \) in the PICS model
- **lambda**
  - An integer. The precision of the prior for mu used for histone data.
- **dMu**
  - An integer. Our best guess for the distance between two neighboring nucleosomes.
- **dataType**
  - A character string. If a valid dataType is specified, use our suggested parameters. "MNase" or "sonicated"
- **PExi**
  - A numeric. With paired end data, 'xi' can be calculated directly from the reads. If PExi is set, it will overwrite the xi determined by the dataType.

**Value**

Returns a list of 6 parameters to be used in PICS.

**Author(s)**

Renan Sauteraud

### SummarySeg

**Summarize a segReadsList object.**

### Description

Returns info about a segReadsList object in a `data.frame` containing the following informations:

- **chr**: chromosome id
- **NF**: number of forward reads
- **NR**: number of reverse reads
- **L**: length of segment
- **min**: start location of segments
- **max**: end location of segments

### Usage

```r
summarySeg(seg)
```

### Arguments

- **seg**
  - An object of class `segReadsList`

### Value

A six columns `data.frame`.
