Package ‘PhenStat’

April 26, 2017

Type Package
Title Statistical analysis of phenotypic data
Version 2.10.0
Date 2016-07-22
Author Natalja Kurbatova, Natasha Karp, Jeremy Mason
Maintainer Jeremy Mason <jmason@ebi.ac.uk>
Depends R (>= 2.3.0)
Imports methods, car, nlme, nortest, MASS, logistf
Suggests RUnit, BiocGenerics
Description Package contains methods for statistical analysis of phenotypic data.
License file LICENSE
NeedsCompilation no

**analysedDataset**

Method "analysedDataset"

**Description**

Method analysedDataset returns subset of the original dataset that was analysed

**Methods**

signature(obj = "PhenTestResult")

**analysedDatasetPhenList**

Method "analysedDatasetPhenList"

**Description**

Method analysedDatasetPhenList returns subset of the original dataset that will be analysed

**Methods**

signature(obj = "PhenList")

**analysedSubset**

Method "analysedSubset"

**Description**

Method analysedSubset returns name of the subset that was analysed by RR or FE frameworks

**Methods**

signature(obj = "htestPhenStat")
analysisResults  Method "analysisResults"

Description
Method analysisResults returns analysis results

Methods
signature(obj = "PhenTestResult")

batchIn  Method "batchIn"

Description
Method batchIn returns TRUE/FALSE values depending on the batch column presence/absence in the dataset

Methods
signature(obj = "PhenList")
signature(obj = "PhenTestResult")

boxplotResidualBatch  Method "boxplotResidualBatch"

Description
Graph function for the Mixed Model framework’s results. Creates a box plot with residue versus batch split by genotype.

Usage
boxplotResidualBatch(phenTestResult, outputMessages=TRUE)

Arguments
phenTestResult instance of the PhenTestResult class that comes from the function testDataset; mandatory argument
outputMessages flag; "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

Author(s)
Natalja Kurbatova, Natasha Karp, Jeremy Mason
boxplotSexGenotype

References

See Also

PhenList and PhenTestResult

Examples

```r
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
    testGenotype="Sparc/Sparc")
result <- testDataset(test,
    depVariable="Lean.Mass")
boxplotResidualBatch(result)
```

Description

Graph function for the phenotypic dataset. Creates a box plot split by sex and genotype.

Usage

```r
boxplotSexGenotype(phenList, depVariable=NULL, graphingName=NULL, outputMessages=TRUE)
```

Arguments

- **phenList**: instance of the PhenList class; mandatory argument
- **depVariable**: a character string defining the dependent variable of interest; mandatory argument
- **graphingName**: a character string defining the name to be used on the graph for the dependent variable; mandatory argument
- **outputMessages**: flag: “FALSE” value to suppress output messages; “TRUE” value to show output messages; default value TRUE

Author(s)

Natalja Kurbatova, Natasha Karp, Jeremy Mason

PhenList

Examples

```r
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
    testGenotype="Sparc/Sparc")
# box plot for dataset with two sexes: males and females
boxplotSexGenotype(test,
    depVariable="Bone.Mineral.Content",
    graphingName="BMC")

file <- system.file("extdata", "test4.csv", package="PhenStat")
test_1sex <- PhenList(dataset=read.csv(file),
    testGenotype="Mysm1/+")
# box plot for females only dataset
boxplotSexGenotype(test_1sex,
    depVariable="Lean.Mass",
    graphingName="Lean Mass (g)")
```

---

**boxplotSexGenotypeBatch**

*Method "boxplotSexGenotypeBatch"

**Description**

NB! Function is deprecated, please use `scatterplotSexGenotypeBatch` function instead. Graph function for the phenotypic dataset. Creates a box plot split by sex, genotype and batch.

Note: the batches are not ordered with time but allow assessment of how the treatment groups lie relative to the normal control variation.

**Usage**

```r
boxplotSexGenotypeBatch(phenList, depVariable=NULL, graphingName=NULL, outputMessages=TRUE)
```

**Arguments**

- `phenList`: instance of the `PhenList` class; mandatory argument
- `depVariable`: a character string defining the dependent variable of interest; mandatory argument
- `graphingName`: a character string defining the name to be used on the graph for the dependent variable; mandatory argument
- `outputMessages`: flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

PhenList

Examples

```r
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
                 testGenotype="Sparc/Sparc")
# box plot for dataset with two sexes: males and females
boxplotSexGenotypeBatch(test,
                        depVariable="Bone.Mineral.Content",
                        graphingName="BMC")

file <- system.file("extdata", "test4.csv", package="PhenStat")
test_1sex <- PhenList(dataset=read.csv(file),
                      testGenotype="Mysm1/+")
# box plot for females only dataset
boxplotSexGenotypeBatch(test_1sex,depVariable="Lean.Mass",
                        graphingName="Lean Mass")
```

---

**Method "boxplotSexGenotypeBatchAdjusted"**

Description

Graph function for the phenotypic dataset. Creates a box plot split by sex and genotype after accounting for batch.

Usage

```r
boxplotSexGenotypeBatchAdjusted(phenList,depVariable=NULL,graphingName=NULL,outputMessages=TRUE)
```

Arguments

- **phenList**: instance of the PhenList class; mandatory argument
- **depVariable**: a character string defining the dependent variable of interest; mandatory argument
- **graphingName**: a character string defining the name to be used on the graph for the dependent variable; mandatory argument
- **outputMessages**: flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

*PhenList*

Examples

```r
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
    testGenotype="Sparc/Sparc")
# box plot for dataset with two sexes: males and females
boxplotSexGenotypeBatchAdjusted(test,  
    depVariable="Bone.Mineral.Content",  
    graphingName="BMC" )
```

```
boxplotSexGenotypeResult

Method "boxplotSexGenotypeResult"

Description

Graph function for the phenotypic dataset. Creates a box plot split by sex and genotype. Is based on PhenTestResult object.

Usage

```r
boxplotSexGenotypeResult(phenTestResult,graphingName=NULL,outputMessages=TRUE)
```

Arguments

- `phenTestResult` instance of the *PhenTestResult* class; mandatory argument
- `graphingName` a character string defining the name to be used on the graph for the dependent variable; mandatory argument
- `outputMessages` flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

`PhenList`

Examples

```r
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
                  testGenotype="Sparc/Sparc")
result <- testDataset(test,
                       depVariable="Lean.Mass")
# box plot for dataset with two sexes: males and females
boxplotSexGenotypeResult(result,
                          graphingName="BMC")

file <- system.file("extdata", "test4.csv", package="PhenStat")
test_1sex <- PhenList(dataset=read.csv(file),
                  testGenotype="Mysm1/+")
result_1sex <- testDataset(test_1sex,
                        depVariable="Lean.Mass")
# box plot for females only dataset
boxplotSexGenotypeResult(result_1sex,
                          graphingName="Lean Mass (g)")
```

---

`boxplotSexGenotypeWeightBatchAdjusted`

*Method "boxplotSexGenotypeWeightBatchAdjusted"*

**Description**

Graph function for the phenotypic dataset. Creates a box plot split by sex and genotype after accounting for batch and weight.

**Usage**

`boxplotSexGenotypeWeightBatchAdjusted(phenList, depVariable=NULL, graphingName=NULL, outputMessages=TRUE)`

**Arguments**

- `phenList`: instance of the `PhenList` class; mandatory argument
- `depVariable`: a character string defining the dependent variable of interest; mandatory argument
- `graphingName`: a character string defining the name to be used on the graph for the dependent variable; mandatory argument
- `outputMessages`: flag; "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE
categoricalBarplot

PhenList

Examples
```r
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file), testGenotype="Sparc/Sparc")
# box plot for dataset with two sexes: males and females
boxplotSexGenotypeWeightBatchAdjusted(test, depVariable="Bone.Mineral.Content", graphingName="BMC")
```

----------

categoricalBarplot Method "categoricalBarplot"

Description
Graph function for the Fisher Exact Test framework’s results. Creates stacked bar plot(s) to compare proportions seen in a categorical variable between different genotypes. Graphs are created for all data and also for each sex individually.

Usage
```r
categoricalBarplot(phenTestResult,outputMessages=TRUE)
```

Arguments
- **phenTestResult** instance of the *PhenTestResult* class that comes from the function *testDataset*; mandatory argument
- **outputMessages** flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

Author(s)
Natalja Kurbatova, Natasha Karp, Jeremy Mason
checkDataset

References

See Also

PhenList

Examples

```r
categoricalBarplot(result)
```

checkDataset

Method "checkDataset"

Description

Checks dataset for the minimum required info:

1. Column names should present
2. Genotype column should present
3. Sex column should present
4. Two data points for each Genotype/Sex combination
5. Number of Genotype levels should be 2
6. Number of Sex levels should be 1 or 2
7. Sex levels have to be "Female" and/or "Male"
8. Records with reference genotype should be in the dataset
9. Records with test genotype should be in the dataset

Perform the following additional checks:

- presence of Weight column,
- presence of Batch column (Assay.Date).

Warning given in case of missed data indicating that you can only fit a glm or to use MM equation "withoutWeight".

Function *checkDataset* is called from PhenList function.

Usage

```r
checkDataset(dataset, testGenotype, refGenotype="+/+", outputMessages=TRUE, dataset.clean=TRUE)
```
Method "classificationTag"

description

Returns a classification tag to assign a sexual dimorphism assessment of the phenotypic change.

Usage

classificationTag(phenTestResult, userMode = "summaryOutput", phenotypeThreshold = 0.01, outputMessages = TRUE)
classificationTag

Arguments

phenTestResult instance of the PhenTestResult class that comes from the function testDataset; mandatory argument

userMode flag: "vectorOutput" a sexual dimorphic classification is assigned with a proviso of later assessing the overall statistical significance; "summaryOutput" the phenotypeThreshold is used to assess the overall statistical significance and then if significant the sexual dimorphic classification determined; defaults to summaryOutput

phenotypeThreshold a numerical value defining the threshold to use in classificationTag in determining whether the genotype effect is classed as significant or not; default value 0.01

outputMessages flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

Value

Returns a classification tag to assign a sexual dimorphism assessment of the phenotypic change. If you are working interactively with the data, the argument "userMode" set to the value "summaryOutput" will use the "phenotypeThreshold" argument’s value to assess statistical significance of the genotype effect and if significant then assign a sexual dimorphic classification. Alternatively, if the "userMode" set to the value "vectorMode", a sexual dimorphic classification will be returned with the MM framework where later you can globally assess whether the variable had a significant genotype effect. With the FE framework and the vectorMode, a NA is returned as the type of the effect cannot be assessed without assessing the statistical significance of the genotype effect.

PhenTestResult

Examples

```r
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
  testGenotype="Sparc/Sparc")
result <- testDataset(test,
  depVariable="Lean.Mass")
classificationTag(result,
  userMode="summaryOutput",
  phenotypeThreshold=0.001)
classificationTag(result,
  userMode="vectorOutput")
```
### comparison

**Method "comparison"**

**Description**

Method `comparison` returns name of the comparison that was performed by RR framework: "High vs Normal/Low" or "Low vs Normal/High"

**Methods**

`signature(obj = "htestPhenStat")`

### dataset

**Method "dataset"**

**Description**

Method `dataset` returns data frame stored in the object

**Methods**

`signature(obj = "PhenList")`

### finalLRModel

**Method "finalLRModel"**

**Description**

This is an internal function run within LR framework. It completes the final stage of the LR framework, which builds the final model and estimates effects. As an internal function, it doesn’t include extensive error testing of inputs. Please use cautiously if calling directly.

Works with `PhenTestResult` object created by `startLRModel` function. The creation of LR final model is based on the significance of different fixed effects, depVariable and equation values stored in `PhenTestResult` object.

**Usage**

`finalLRModel(phenTestResult, outputMessages = TRUE)`

**Arguments**

- `phenTestResult` instance of the `PhenTestResult` class that comes from the function `testDataset`; mandatory argument
- `outputMessages` flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE
Value

Returns results stored in instance of the `PhenTestResult` class

Author(s)

Natalja Kurbatova, Natasha Karp, Jeremy Mason

References

See Also

`PhenTestResult` and `testDataset`

Examples

```r
file <- system.file("extdata", "testLR.csv", package="PhenStat")
testLR <- PhenList(dataset=read.csv(file),
                   testGenotype="Mock")
testLR2 <- LRDataset(testLR,"V2")

# when "testDataset" function's argument "callAll" is set to FALSE
# only "startLRModel" function is called - the first step of LR framework
resultLR <- testDataset(testLR2,
                         depVariable="V2",
                         callAll=FALSE,
                         method="LR")

# print out formula that has been created
analysisResults(resultLR)$model.formula.genotype

# print out batch effect's significance
analysisResults(resultLR)$model.effect.batch

resultLR <- finalLRModel(resultLR)
```

Description

This is an internal function run within MM framework. It completes the final stage of the MM framework, which builds the final model and estimates effects. As an internal function, it doesn’t include extensive error testing of inputs. Please use cautiously if calling directly.

Works with `PhenTestResult` object created by `startModel` function. The creation of MM final model is based on the significance of different fixed effects, `depVariable` and equation values stored in `PhenTestResult` object.

Usage

```r
finalModel(phenTestResult, outputMessages = TRUE)
```
Arguments

phenTestResult  instance of the PhenTestResult class that comes from the function testDataset; mandatory argument

outputMessages  flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

Value

Returns results stored in instance of the PhenTestResult class

Author(s)

Natalja Kurbatova, Natasha Karp, Jeremy Mason

PhenTestResult and testDataset

Examples

file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
testGenotype="Sparc/Sparc")
# when "testDataset" function's argument "callAll" is set to FALSE
# only "startModel" function is called - the first step of MM framework
result <- testDataset(test,
  depVariable="Lean.Mass",
  equation="withoutWeight",
  callAll=FALSE)
# print out formula that has been created
# result$model.formula.genotype
# print out batch effect's significance
# result$model.effect.batch
# change the model
# result <- testDataset(test,
#   # depVariable="Lean.Mass",
#   # equation="withWeight",
#   # callAll=FALSE)
# print out new formula
#result$model.formula.genotype
# run the final model fitting when statisfied with the model
result <- finalModel(result)
Method "finalTFModel"

Description
This is an internal function run within TF framework. It completes the final stage of the TF framework, which builds the final model and estimates effects. As an internal function, it doesn’t include extensive error testing of inputs. Please use cautiously if calling directly.

Works with PhenTestResult object created by startTFModel function. The creation of TF final model is based on the significance of different fixed effects, depVariable and equation values stored in PhenTestResult object.

Usage
```
finalTFModel(phenTestResult, outputMessages = TRUE)
```

Arguments
- `phenTestResult` instance of the PhenTestResult class that comes from the function testDataset; mandatory argument
- `outputMessages` flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

Value
Returns results stored in instance of the PhenTestResult class

Author(s)
Natalja Kurbatova, Natasha Karp, Jeremy Mason

PhenTestResult and testDataset

Examples
```
file <- system.file("extdata", "test7_TFE.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
                 testGenotype="het",
                 refGenotype = "WT",
                 dataset.colname.sex="sex",
                 dataset.colname.genotype="Genotype",
                 dataset.values.female="f",
                 dataset.values.male = "m",
```
dataset.colname.weight="body.weight",
dataset.colname.batch="Date_of_procedure_start")

# when "testDataset" function's argument "callAll" is set to FALSE
# only "startTFModel" function is called - the first step of TFE framework
result <- testDataset(test_TF,
                     depVariable="Cholesterol",
                     callAll=FALSE,
                     method="TF")

# print out formula that has been created
analysisResults(result)$model.formula.genotype
# print out batch effect's significance
analysisResults(result)$model.effect.batch
result <- finalTFModel(result)

FisherExactTest

Method "FisherExactTest"

Description
The main function of the Fisher Exact Test framework. Creates n times 2 matrices with record
counts, where n rows represent dependent variable levels and two columns represent genotype lev-
els. Performs Fisher Exact Tests on calculated count matrices.
Three matrices can be created and three tests can be potentially perform depending on the dataset:
- all records together regardless the sex values - combined dataset,
- records where sex value is "Male" (if such exists) - males only dataset,
- records where sex value is "Female" (if such exists) - females only dataset.
Together with count matrices creates percentage matrices, calculates effect sizes and statistics for
The results (matrices, statistics and Fisher Exact Test outputs) are stored in PhenTestResult object.
The function is called from "testDataset" function when "method" argument is set to "FE" meaning
"Fisher Exact Test".

Usage
FisherExactTest(phenList, depVariable, outputMessages=TRUE)

Arguments
phenList instance of the PhenList class; mandatory argument
depVariable a character string defining the dependent variable of interest; mandatory argu-
ment
outputMessages flag: "FALSE" value to suppress output messages; "TRUE" value to show output
messages; default value TRUE

Value
Returns results stored in instance of the PhenTestResult class

**generateGraphs**

**Author(s)**

Natalja Kurbatova, Natasha Karp, Jeremy Mason

**References**

**See Also**

PhenTestResult

**Examples**

```r
file <- system.file("extdata", "test_categorical.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
    testGenotype="Aff3/Aff3")
# "FisherExactTest" function is called from "testDataset" function.
result <- testDataset(test, depVariable="Thoracic.Processes", method="FE")
# Fisher Exact Test results can be printed out using function "summaryOutput"
summaryOutput(result)
```

---

**generateGraphs**  
Method "generateGraphs"

**Description**

Function generates graphs for the Mixed Model and Time as Fixed Effect frameworks’ results and stores generated graphs in the defined directory.

**Usage**

```r
generateGraphs(phenTestResult, dir, 
    graphingName=NULL, type="Xlib")
```

**Arguments**

- **phenTestResult** instance of the PhenTestResult class that comes from the function testDataset; mandatory argument
- **dir** directory where to store generated graphs; mandatory argument
- **graphingName** a character string defining the name to be used on the graph for the dependent variable; defaults to NULL then the depVariable name will be plotted
- **type** character string, one of "Xlib" or "quartz" (some OS X builds) or "cairo", or "window", or cairo-png”; mandatory argument

PhenTestResult

getColumn

*Method "getColumn"*

Description

Method getColumn returns column of interest

Methods

signature(obj = "PhenList")

ggetColumnBatchAdjusted

*Method "getColumnBatchAdjusted"*

Description

Method getColumnBatchAdjusted returns column of interest adjusted for batch

Methods

signature(obj = "PhenList")

ggetColumnView

*Method "getColumnView"*

Description

Method getColumnView returns RR or FE frameworks results in a column format

Methods

signature(obj = "htestPhenStat")
**getColumnWeightBatchAdjusted**

*Method "getColumnWeightBatchAdjusted"*

**Description**

Method `getColumnWeightBatchAdjusted` returns column of interest adjusted for weight and batch.

**Methods**

signature(obj = "PhenList")

**getCountMatrices**

*Method " getCountMatrices"*

**Description**

Method `getCountMatrices` returns count matrices for FE and RR frameworks.

**Methods**

signature(obj = "PhenTestResult")

**getDataset**

*Method " getDataset"*

**Description**

Method `getDataset` returns data frame stored in the object.

**Methods**

signature(obj = "PhenList")

**getGenotypeEffect**

*Method " getGenotypeEffect"

**Description**

Method `getGenotypeEffect` returns genotype effect and standard error for the linear regression frameworks.

**Methods**

signature(obj = "PhenTestResult")
getMatrix

**Method** "getMatrix"

**Description**
Method `getMatrix` returns RR or FE frameworks results in a matrix format.

**Methods**

- `signature(obj = "htestPhenStat")`

getPercentageMatrix

**Method** "getPercentageMatrix"

**Description**
Method `getPercentageMatrix` returns percentage matrix calculated out of counts.

**Methods**

- `signature(obj = "htestPhenStat")`

getStat

**Method** "getStat"

**Description**
Method `getStat` returns simple statistics about variables in the dataset.

**Methods**

- `signature(obj = "PhenList")`

getVariable

**Method** "getVariable"

**Description**
Method `getVariable` returns dependent variable name.

**Methods**

- `signature(obj = "PhenTestResult")`
getVariables

Method "getVariables"

Description
Method getVariables returns names of variables in the dataset

Methods
signature(obj = "PhenList")

hemiGenotype

Method "hemiGenotype"

Description
Method hemiGenotype returns hemi genotype if defined

Methods
signature(obj = "PhenList")
signature(obj = "PhenTestResult")

JSONOutput

Method "JSONOutput"

Description
Wrapper for the model fitting results. Returns model fitting and testing results in a JSON format. Assumes that modelling results are stored in the PhenTestResult object (output from function testDataset).

Usage
JSONOutput(phenTestResult, phenotypeThreshold = 0.01)

Arguments
phenTestResult instance of the PhenTestResult class that comes from the function testDataset; mandatory argument
phenotypeThreshold a numerical value defining the threshold to use in classificationTag; default value 0.01

Value
Returns a vector with model fitting results in JSON format: model output summary and other values
LRDataset

PhenTestResult

Examples

# Mixed Model framework
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
    testGenotype="Sparc/Sparc")
result <- testDataset(test,
    depVariable="Lean.Mass")
JSONOutput(result)

# Fishe Exact Test framework
file <- system.file("extdata", "test_categorical.csv", package="PhenStat")
test2 <- PhenList(dataset=read.csv(file),
    testGenotype="Aff3/Aff3")
result2 <- testDataset(test2,
    depVariable="Thoracic.Processes",
    method="FE")
JSONOutput(result2)

LRDataset

Method "LRDataset"

Description

Prepares dataset for the LR framework - maps values of dependent variable to 0/1, where 1 is modeled.

Usage

LRDataset(phenList = NULL, depVariable = NULL, abnormalValues = c("abnormal", "Abnormal", "TRUE", "deviant"),
    outputMessages = TRUE)

Arguments

phenList instance of the PhenList class; mandatory argument
depVariable a character string defining the dependent variable of interest; mandatory argu-
ment
abnormalValues a list of abnormal values that will be mapped to 0; mandatory argument
outputMessages flag: "FALSE" value to suppress output messages; "TRUE" value to show output mes-
sages; default value TRUE

Value

Returns dataset suitable for LR framework, where provided abnormal values are mapped to 1 and all other values of dependent variable are assumed to be normal and are mapped to 0.

References

Examples

```r
file <- system.file("extdata", "testLR.csv", package="PhenStat")
testLR <- PhenList(dataset=read.csv(file), testGenotype="Mock")
testLR2 <- LRDataset(testLR,"V2")
```

matrixCount

### Method "matrixCount"

**Description**

Method `matrixCount` returns matrix of counts that was created by RR or FE framework.

**Methods**

**signature**

```r
signature(obj = "htestPhenStat")
```

**method**

### Method "method"

**Description**

Method `method` returns method abbreviation, for example: "RR", "MM".

**Methods**

**signature**

```r
signature(obj = "PhenTestResult")
```

**methodText**

### Method "methodText"

**Description**

Method `methodText` returns method’s name, for example: "Reference Range Plus", "Linear Mixed Model".

**Methods**

**signature**

```r
signature(obj = "PhenTestResult")
```
multipleBatches  
**Method** "multipleBatches"

**Description**
Method `multipleBatches` returns TRUE if there are multiple batches in the dataset, FALSE otherwise

**Methods**
- `signature(obj = "PhenList")`

noSexes  
**Method** "noSexes"

**Description**
Method `noSexes` returns number of sex levels: 1/2

**Methods**
- `signature(obj = "PhenList")`
- `signature(obj = "PhenTestResult")`

parameters  
**Method** "parameters"

**Description**
Method `parameters` returns parameters specific for applied method/dataset combination

**Methods**
- `signature(obj = "PhenTestResult")`
Method "parserOutputSummary"

Description
Parsers model output summary and returns it in readable named vector format.

Usage

```r
parserOutputSummary(linearRegressionOutput)
```

Arguments

- `linearRegressionOutput`
  linear regression output that comes from the MM methods; mandatory argument.

Value
Returns a named vector with linear regression model output summary results.

Author(s)

Natalja Kurbatova, Natasha Karp, Jeremy Mason

result <- testDataset(test,
                      depVariable="Lean.Mass")
linearRegressionOutput <- analysisResults(result)
parserOutputSummary(linearRegressionOutput)
```
**Method** "parserOutputSummaryLR"

**Description**

Parsers model output summary and returns it in readable named vector format

**Usage**

```r
parserOutputSummaryLR(linearRegressionOutput)
```

**Arguments**

- `linearRegressionOutput`
  
  linear regression output that comes from the MM methods; mandatory argument

**Value**

Returns a named vector with logistic regression model output summary results

resultLR <- testDataset(testLR2,
  depVariable="V2",
  method="LR")
linearRegressionOutput <- analysisResults(resultLR)
parserOutputSummaryLR(linearRegressionOutput)
```
**Method "parserOutputTFSummary"**

**Description**

Parsers model output summary from TF framework and returns it in readable named vector format.

**Usage**

```
parserOutputTFSummary(linearRegressionOutput)
```

**Arguments**

- `linearRegressionOutput`

  linear regression output that comes from the TF method; mandatory argument.

**Value**

Returns a named vector with model output summary results.

result <- testDataset(test,
    depVariable="Ca",
    method="TF",
    dataPointsThreshold=2)
linearRegressionOutput <- analysisResults(result)
parserOutputTFSummary(linearRegressionOutput)
```
PhenList

Method "PhenList"

Description

Function to create data object from the data frame.

In addition to dependent variable column (the variable of interest) mandatory columns that should
present in the data frame are "Genotype" and "Sex". The "Assay.Date" column is used to model
"Batch" effect if not specified differently. "Weight" column is used to model body weight effect.

Function creates PhenList object, checks data integrity, renames columns when requested, provides
simple statistics about dataset.

Returns an instance of the PhenList object created from the data file.

Dataset is cleaned to ensure there is a maximum two sex levels and there are exactly two levels for
genotype. Data cleaning can be switched off by defining the argument "dataset.clean" as FALSE.

Usage

PhenList(dataset, testGenotype, refGenotype="+/+", hemiGenotype=NULL, outputMessages=TRUE, dataset.clean=TRUE, dataset.colname.batch=NULL, dataset.colname.genotype=NULL, dataset.colname.sex=NULL, dataset.colname.weight=NULL, dataset.values.missingValue=" ", dataset.values.male=NULL, dataset.values.female=NULL)

Arguments

dataset data frame created from file or from another source; mandatory argument
testGenotype defines the test genotype to be compared to the reference genotype; mandatory
argument
refGenotype defines the reference genotype; assigned default value is "+/+"
hemiGenotype defines the genotype value for hemizygous that will be changed to test genotype
value
outputMessages flag: "FALSE" value to suppress output messages; "TRUE" value to show output
messages; assigned default value is TRUE
dataset.clean flag: "FALSE" value for no modification of the dataset; "TRUE" value to clean
dataset if needed; assigned default value is TRUE
dataset.colname.batch column name within dataset for the batch effect
dataset.colname.genotype column name within dataset for the genotype info
dataset.colname.sex column name within dataset for the sex info
dataset.colname.weight column name within dataset for the weight info
dataset.values.missingValue value used as missing value in the dataset
PhenList-class

dataset.values.male
value used to label "males" in the dataset
dataset.values.female
value used to label "females" in the dataset

Value
Returns an instance of the PhenList class.

Author(s)
Natalja Kurbatova, Natasha Karp, Jeremy Mason

PhenList

Examples
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
testGenotype="Sparc/Sparc")

file <- system.file("extdata", "test2.csv", package="PhenStat")
test2 <- PhenList(dataset=read.csv(file),
testGenotype="Arid4a/Arid4a",
refGenotype="+/+",
hemiGenotype="Arid4a/+",
dataset.colname.weight="Weight.Value")

file <- system.file("extdata", "test3.csv", package="PhenStat")
test3 <- PhenList(dataset=read.csv(file),
dataset.clean=TRUE,
dataset.values.female=1,
dataset.values.male=2,
testGenotype="Mysm1/+")
Explore PhenList object

PhenList object instance contains the following slots:

1. "datasetPL" where cleaned and checked dataset is stored: getDataset(phenList)
2. "testGenotype" where the genotype level to test is stored: testGenotype(phenList)
3. "refGenotype" where reference genotype value is stored with default value set to "+/+":
   refGenotype(phenList)
4. "hemiGenotype" if defined contains the genotype value for hemizygous: hemiGenotype(phenList)
5. "dataset.clean" flag value is stored, see PhenList for more details:
   phenList@dataset.clean
6. "dataset.colname" if defined contains dataset column names that have been renamed:
   - phenList@dataset.colname.batch column name for batch values
   - phenList@dataset.colname.genotype column name for genotype values
   - phenList@dataset.colname.sex column name for sex values
   - phenList@dataset.colname.weight column name for weight values
7. "dataset.values" if defined contains dataset values that have been changed during dataset cleaning
   process:
   - phenList@dataset.values.missingValue value used as missing value in the original dataset
   - phenList@dataset.values.male value used to label "males" in the original dataset
   - phenList@dataset.values.female value used to label "females" in the original dataset

Slots

datasetPL: Object of class "data.frame" ~~ dataset to work with
refGenotype: Object of class "character" ~~ reference genotype
testGenotype: Object of class "character" ~~ test genotype
hemiGenotype: Object of class "character" ~~ hemi genotype
dataset.colname.batch: Object of class "character" ~~ column name for batch values
dataset.colname.genotype: Object of class "character" ~~ column name for genotype values
dataset.colname.sex: Object of class "character" ~~ column name for sex values
dataset.colname.weight: Object of class "character" ~~ column name for weight values
dataset.values.missingValue: Object of class "character" ~~ value used as missing value in the original dataset
dataset.values.male: Object of class "character" ~~ value used to label "males" in the original dataset
dataset.values.female: Object of class "character" ~~ value used to label "females" in the original dataset
dataset.clean: Object of class "logical" ~~ flag value is stored
datasetUNF: Object of class "data.frame" ~~ unfiltered dataset
Methods

- `getDataset` (accessor): Returns dataset
- `refGenotype` (accessor): Returns reference genotype
- `testGenotype` (accessor): Returns test genotype
- `hemiGenotype` (accessor): Returns hemi genotype if specified
- `getColumn` Returns specified column if exists
- `getColumnBatchAdjusted` Returns specified column adjusted for batch effect
- `getColumnWeightBatchAdjusted` Returns specified column adjusted for batch and weight effects
- `getStat` Returns simple dataset statistics
- `getVariables` Returns dataset column names
- `batchIn` Returns TRUE if the batch is in the dataset, FALSE otherwise
- `weightIn` Returns TRUE if the weight is in the dataset, FALSE otherwise
- `multipleBatches` Returns TRUE if the batches are variable in the dataset, FALSE otherwise
- `noSexes` Returns number of sexes in the dataset
- `setBatch` Sets the batch column - change the column names
- `setGenotype` Sets the genotype column - change the column names
- `setMissingValue` Sets the missing value
- `setSex` Sets the sex column - change the column names
- `setWeight` Sets the weight column - change the column names

```
PhenTestResult

Method "PhenTestResult"

Description

Creates PhenTestResult object based on test results or model building results. Internal function for the package. Not build for users to directly call.

Usage

PhenTestResult(model.output=NULL, model.dataset=NULL, depVariable=NULL, refGenotype=NULL, equation="withWeight", method="MM", model.effect.batch=NULL, model.effect.variance=NULL,model.effect.sex=NULL, model.effect.weight=NULL, numberSexes=NULL, pThreshold=0.05, model.formula.null=NULL, model.formula.genotype=NULL, model.output.genotype.nulltest.pVal=NULL, model.output.quality=NULL, model.output.summary=NULL, model.output.averageRefGenotype = NULL, model.output.percentageChanges = NULL)

Arguments

model.output representing the model fit gls object or lme object
model.dataset dataset used for modeling
depVariable depending variable in the model
refGenotype reference genotype in the model
equation possible values: "withWeight" to include weight effect into model, "withoutWeight" to exclude weight effect from the model
method possible values: "MM" to work with Mixed Model framework, "FE" to work with Fisher Exact Test framework
model.effect.batch Result of the test for batch effect significance
model.effect.variance Result of the test for residual variance effect
model.effect.sex Result of the test for sex effect significance
model.effect.weight Result of the test for weight effect significance
model.effect.interaction Result of the test for genotype by sex interaction significance
model.output.interaction Interaction test result: p-value
numberSexes number of possible sex values in the dataset
pThreshold p-value threshold used to evaluate the effect significance, default value 0.05
PhenTestResult

model.formula.null
  formula for the model without genotype effect
model.formula.genotype
  formula for the model with genotype effect
model.output.genotype.nulltest.pVal
  Genotype test results: p-value
model.output.quality
  vector that contains diagnostic test output for mixed model quality of fit
model.output.summary
  named vector that contains summary of the model output
model.output.averageRefGenotype
  named vector that contains mean values calculated for reference genotype records
model.output.percentageChanges
  named vector that contains percentage changes values per sex

Value

Returns an instance of the PhenTestResult class.

PhenTestResult

Examples

file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
  testGenotype="Sparc/Sparc")
# "testDataset" function calls "PhenTestResult" function internally
result <- testDataset(test,
  equation="withoutWeight",
  depVariable="Lean.Mass")
class(result)
PhenTestResult-class

Class "PhenTestResult"

Description

A list-based S4 class for storing of model fitting results and other information like dependent variable, method used to build a model, etc. Helps to support operations needed for model fitting process and modelling/testing results storage. In the package PhenTestResult object is created by function testDataset.

Explore PhenTestResult object

PhenTestResults object instance contains the following slots:
1. "analysedDataset" contains subdataset that was used for the modelling/testing:
   analysedDataset(phenTestResult)
2. "depVariable" contains dependent variable that was tested: getVariable(phenTestResult)
3. "refGenotype" contains reference genotype which is usually is wildtype: refGenotype(phenTestResult)
4. "testGenotype" contains test genotype: testGenotype(phenTestResult)
5. "method" contains method name that was used for modelling/testing: method(phenTestResult)
6. "transformationRequired" contains TRUE/FALSE value indicating transformation of dependent variable:
   transformationText(phenTestResult) or phenTestResult@transformationRequired
7. "lambdaValue" contains lambda value for the Box-Cox transformation:
   transformationText(phenTestResult) or phenTestResult$lambdaValue
8. "scaleShift" contains the value of scale shift for Box-Cox transformation:
   transformationText(phenTestResult) or phenTestResult@scaleShift
9. "transformationCode" contains the code of transformation. Possible values:
   0 - transformation is not applicable (methods "FE", "RR", "LR") or switched off by user
   1 - transformation is not needed (1 is within the 95
   2 - log transformation
   3 - power transformation
   4 - transformation is not performed since optimal lambda value is not found (-5 > lambda > 5)
   transformationText(phenTestResult) or phenTestResult@transformationCode
10. "parameters" contains the parameters used during method application, e.g. pThreshold for MM and TF:
    parameters(phenTestResult)
11. Modelling/testing results are stored in the sections "analysisResults": analysisResults(phenTestResult)
The contents of the analysisResults slot depend on framework that was used.
The results of MM and TF frameworks: 1. Equation used during linear modeling: analysisResults(phenTestResult)$equation
2. Batch effect significance: analysisResults(phenTestResult)$model.effect.batch
3. Variance equality: analysisResults(phenTestResult)$model.effect.variance
4. Weight effect significance: analysisResults(phenTestResult)$model.effect.weight
5. Sex effect significance: analysisResults(phenTestResult)$model.effect.interaction
6. Evidence of sex effect (p-value): analysisResults(phenTestResult)$model.output.interaction
7. Evidence of genotype effect (p-value): analysisResults(phenTestResult)$model.output.genotype.nulltest.pVal
8. Formula for the final genotype model: analysisResults(phenTestResult)$model.formula.genotype
9. Formula for the final null model: analysisResults(phenTestResult)$model.formula.null
10. Model fitting output: analysisResults(phenTestResult)$model.output
11. Model fitting summary: summary(analysisResults(phenTestResult)$model.output)$tTable

The results of FE and RR frameworks are stored as a list of htestPhenStat S4 objects: analysisResults(phenTestResult).

Each one htestPhenStat object contains:
1. Output of Fisher Exact Test: pvalue(analysisResults(phenTestResult)[[1]]).
2. Effect size: ES(analysisResults(phenTestResult)[[1]]).
3. Name of the table analysed (all, males, females): analysedSubset(analysisResults(phenTestResult)[[1]]).
4. Comparison, used for RR only (High vs Normal/Low, Low vs High/Normal): comparison(analysisResults(phenTestResult)[[1]]).
5. Matrix of counts: matrixCount(analysisResults(phenTestResult)[[1]])

Slots
analysedDataset: Object of class "data.frame" ~~ analysed dataset
transformationRequired: Object of class "logical" ~~ flag indicating was or not transformation performed
lambdaValue: Object of class "numeric" ~~ Box-Cox transform lambda value
scaleShift: Object of class "numeric" ~~ Box-Cox transform scale shift
transformationCode: Object of class "numeric" ~~ code explaining the transformation output
depVariable: Object of class "character" ~~ dependent variable
refGenotype: Object of class "character" ~~ reference genotype
testGenotype: Object of class "character" ~~ test genotype
method: Object of class "character" ~~ analysis method
parameters: Object of class "matrix" ~~ parameters of method
analysisResults: Object of class "list" ~~ results of the analysis

Methods
getVariable (accessor): Returns dependent variable
refGenotype (accessor): Returns reference genotype
testGenotype (accessor): Returns test genotype
method (accessor): Returns method used
methodText (accessor): Returns full name of the method used
parameters (accessor): Returns parameters used during the method application
analysisResults (accessor): Returns analysis results depending on method
analysedDataset (accessor): Returns analysed dataset
transformationText (accessor): Returns the info about transformation
batchIn Returns TRUE if the batch is in the dataset, FALSE otherwise
weightIn Returns TRUE if the weight is in the dataset, FALSE otherwise
noSexes Returns number of sexes in the dataset
show Prints out the PhenTestResult object
getCountMatrices Returns count matrices if they are present (for methods "FE" and "RR"), NULL otherwise.

getVariable(result)
method(result)
for (i in seq_along(analysisResults(result))) {
  val <- analysisResults(result)[[i]]
  val
}
**pvalue**

### Description

Graph function for the Mixed Model framework’s results. Creates predicted versus residual values plots split by genotype.

### Usage

```r
plotResidualPredicted(phenTestResult, outputMessages=TRUE)
```

### Arguments

- `phenTestResult`: instance of the `PhenTestResult` class that comes from the function `testDataset`; mandatory argument
- `outputMessages`: flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

### Author(s)

Natalja Kurbatova, Natasha Karp, Jeremy Mason

### References

### See Also

file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
                 testGenotype="Sparc/Sparc")
result <- testDataset(test,
                      depVariable="Lean.Mass")
plotResidualPredicted(result)
```

---

**pvalue**

### Method "pvalue"

### Description

Method `pvalue` returns p-value that was calculate by RR or FE framework.

### Methods

```r
signature(obj = "htestPhenStat")
```
Method "qqplotGenotype"

Description

Graph function for the Mixed Model framework’s results. Creates a Q-Q plot of residuals for each genotype.

Usage

qqplotGenotype(phenTestResult, outputMessages = TRUE)

Arguments

- phenTestResult: instance of the PhenTestResult class that comes from the function testDataset; mandatory argument
- outputMessages: flag; "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

Author(s)

Natalja Kurbatova, Natasha Karp, Jeremy Mason

result <- testDataset(test,
                      depVariable = "Lean.Mass")
qqplotGenotype(result)
```
**Method "qqplotRandomEffects"**

**Description**
Graph function for the Mixed Model framework’s results. Creates a Q-Q plot of blups (best linear unbiased predictions).

**Usage**

```r
qqplotRandomEffects(phenTestResult, outputMessages=TRUE)
```

**Arguments**

- `phenTestResult` instance of the `PhenTestResult` class that comes from the function `testDataset`; mandatory argument
- `outputMessages` flag: “FALSE” value to suppress output messages; “TRUE” value to show output messages; default value TRUE

**Author(s)**
Natalja Kurbatova, Natasha Karp, Jeremy Mason

file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
                testGenotype="Sparc/Sparc")
result <- testDataset(test, depVariable="Lean.Mass")
qqplotRandomEffects(result)
```
qqplotRotatedResiduals

Method "qqplotRotatedResiduals"

Description

Graph function for the Mixed Model framework’s results. Creates a Q-Q plot of rotated residuals.

Usage

qqplotRotatedResiduals(phenTestResult, outputMessages=TRUE)

Arguments

phenTestResult instance of the PhenTestResult class that comes from the function testDataset; mandatory argument

outputMessages flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

Author(s)

Natalja Kurbatova, Natasha Karp, Jeremy Mason

Examples

file <- system.file("extdata", "test2.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
    dataset.colname.weight="Weight.Value",
    testGenotype="Arid4a/Arid4a",
    hemiGenotype="Arid4a/+")
result <- testDataset(test,
    depVariable="Cl")
qqplotRotatedResiduals(result)
**recommendMethod**  

**Method "recommendMethod"**

**Description**

Checks the dependent variable and dataset to make choose the appropriate statistical method. Returns the method or the list of methods that are appropriate for statistical analysis.

**Usage**

```r
recommendMethod(phenList=NULL, depVariable=NULL, outputMessages=TRUE)
```

**Arguments**

- `phenList`: instance of the `PhenList` class; mandatory argument
- `depVariable`: a character string defining the dependent variable of interest; mandatory argument
- `outputMessages`: flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

**Value**

Returns the method or the list of methods that are appropriate for statistical analysis.

**Author(s)**

Natalja Kurbatova, Natasha Karp, Jeremy Mason

`PhenList`

**Examples**

```r
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file), testGenotype="Sparc/Sparc")
recommendMethod(test,"Lean.Mass")
```
**Method "refGenotype"**

**Description**
Method refGenotype returns reference genotype

**Methods**

- `signature(obj = "PhenList")`
- `signature(obj = "PhenTestResult")`

**Method "RRTest"**

**Description**
This is an internal function run within RR framework. It performs Reference Ranges Plus test and after that Fisher Exact test on calculated count matrices. As an internal function, it doesn’t include extensive error testing of inputs. Please use cautiously if calling directly.

Works with PhenList object created by PhenList function.

**Usage**

`RRTest(phenList, depVariable, outputMessages=TRUE, naturalVariation=95, controlPointsThreshold=60)`

**Arguments**

- `phenList` instance of the PhenList class; mandatory argument
- `depVariable` a character string defining the dependent variable of interest; mandatory argument
- `outputMessages` flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE
- `naturalVariation` number defining the natural variation range in percents for normal values; default value 95
- `controlPointsThreshold` number defining how many control points is needed to perform RR plus method; default value 60

**Value**

Returns results stored in instance of the PhenTestResult class

Examples

```r
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
                 testGenotype="Sparc/Sparc")
# "RRTest" function is called from "testDataset" function
result <- testDataset(test,
                      depVariable="Lean.Mass",
                      method="RR")
# RR test results can be printed out using function "summaryOutput"
summaryOutput(result)
```

scatterplotGenotypeWeight

*Method "scatterplotGenotypeWeight"*

Description

Graph function for the phenotypic dataset. Creates a scatter plot body weight versus dependent variable.

Both a regression line and a loess line (locally weighted line) is fitted for each genotype.

Usage

`scatterplotGenotypeWeight(phenList, depVariable=NULL, graphingName=NULL, outputMessages=TRUE)`

Arguments

- `phenList` instance of the PhenList class; mandatory argument
- `depVariable` a character string defining the dependent variable of interest; mandatory argument
- `graphingName` a character string defining the name to be used on the graph for the dependent variable; mandatory argument
- `outputMessages` flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

scatterplotGenotypeWeight(test_1sex,
  depVariable="Lean.Mass",
  graphingName="Lean Mass")
```

---

**scatterplotGenotypeWeightResult**

Method "scatterplotGenotypeWeightResult"

**Description**

Graph function for the phenotypic dataset. Creates a scatter plot body weight versus dependent variable. It is based on PhenTestResult object. Both a regression line and a loess line (locally weighted line) is fitted for each genotype.

**Usage**

```r
scatterplotGenotypeWeightResult(phenTestResult,graphingName=NULL,outputMessages=TRUE)
```

**Arguments**

- **phenTestResult** instance of the PhenTestResult class; mandatory argument
- **graphingName** a character string defining the name to be used on the graph for the dependent variable; mandatory argument
- **outputMessages** flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

   depVariable="Lean.Mass")
scatterplotGenotypeWeightResult(result_1sex, 
   graphingName="Lean Mass")
```

**scatterplotSexGenotypeBatch**

*Method "scatterplotSexGenotypeBatch"*

**Description**

Graph function for the phenotypic dataset. Creates a scatterplot split by sex, genotype and batch. refGenotype data points are shown in black and the testGenotype data points are shown in red.

Note: the batches are not ordered with time but allow assessment of how the testGenotype data lie relative to the variation within the refGenotype data.

**Usage**

`scatterplotSexGenotypeBatch(phenList, depVariable=NULL, graphingName=NULL, outputMessages=TRUE)`

**Arguments**

- **phenList**: instance of the PhenList class; mandatory argument
- **depVariable**: a character string defining the dependent variable of interest; mandatory argument
- **graphingName**: a character string defining the name to be used on the graph for the dependent variable; mandatory argument
- **outputMessages**: flag; "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

Method "startLRModel"

Description

This is an internal function run within LR framework. It completes the testing stage of which effects are significant. As an internal function, it doesn’t include extensive error testing of inputs. Please use cautiously if calling directly.

It creates start model and modify it after testing of different hypothesis.

The tested effects are:
- batch effect (TRUE if batch variation is significant, FALSE if not), though it is never used in final LR model;
- interaction effect (TRUE if genotype by sex interaction is significant),
- sex effect (TRUE if sex is significant),
- weight effect and variance effect are not tested and used in LR model.

Usage

```r
startLRModel(phenList, depVariable, outputMessages=TRUE, pThreshold=0.05)
```

Arguments

- **phenList**: instance of the `PhenList` class; mandatory argument
- **depVariable**: a character string defining the dependent variable of interest; mandatory argument
- **outputMessages**: flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE
- **pThreshold**: a numerical value for the p-value threshold used to determine which fixed effects to keep in the model, default value 0.05

Value

Returns results stored in instance of the `PhenTestResult` class

Author(s)

Natalja Kurbatova, Natasha Karp, Jeremy Mason

Examples

```r
file <- system.file("extdata", "testLR.csv", package="PhenStat")
testLR <- PhenList(dataset=read.csv(file),
                     testGenotype="Mock")
testLR2 <- LRDataset(testLR,"V2")

# when "testDataset" function's argument "callAll" is set to FALSE
# only "startLRModel" function is called - the first step of LR framework
resultLR <- testDataset(testLR2,
                         depVariable="V2",
                         callAll=FALSE,
                         method="LR")

# print out formula that has been created
analysisResults(resultLR)$model.formula.genotype

# print out batch effect's significance
analysisResults(resultLR)$model.effect.batch
```

### startModel

**Method "startModel"**

**Description**

This is an internal function run within MM framework. It completes the testing stage of which effects are significant. As an internal function, it doesn’t include extensive error testing of inputs. Please use cautiously if calling directly.

It creates start model and modify it after testing of different hypothesis (the model fixed effects).

The model random effects are:

- batch effect (TRUE if batch variation is significant, FALSE if not)

The model fixed effects are:

- variance effect (TRUE if residual variances for genotype groups are homogeneous and FALSE if they are heterogeneous),
- interaction effect (TRUE if genotype by sex interaction is significant),
- sex effect (TRUE if sex is significant),
- weight effect (TRUE if weight is significant).

If user would like to assign other TRUE/FALSE values to the fixed effects of the model then he or she has to define keepList argument which is vector of TRUE/FALSE values.

If user has defined model fixed effects (keepList argument) then function prints out calculated and user defined effects (only when outputMessages argument is set to TRUE), checks user defined effects for consistency (for instance, if there are no "Weight" column in the dataset then weight effect can’t be assigned to TRUE, etc.) and modifies start model according to user defined effects.

As the result PhenTestResult object that contains calculated or user defined model fixed effects and MM start model is created.

**Usage**

```
startModel(phenList, depVariable,
           equation="withWeight", outputMessages=TRUE,
           pThreshold=0.05, keepList=NULL)
```
Arguments

phenList instance of the PhenList class; mandatory argument
depVariable a character string defining the dependent variable of interest; mandatory argument
equation a character string defining the equation to use. Possible values "withWeight" (default), "withoutWeight"
outputMessages flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE
pThreshold a numerical value for the p-value threshold used to determine which fixed effects to keep in the model, default value 0.05
keepList a logical vector defining the significance of different model effects: keep_batch, keep_equalvar, keep_weight, keep_sex, keep_interaction; default value NULL

Value

Returns results stored in instance of the PhenTestResult class

Author(s)

Natalja Kurbatova, Natasha Karp, Jeremy Mason

test <- PhenList(dataset=read.csv(file), testGenotype="Sparc/Sparc")
# when "testDataset" function's argument "callAll" is set to FALSE
# only "startModel" function is called - the first step of MM framework
result <- testDataset(test, depVariable="Lean.Mass", callAll=FALSE)
# print out formula that has been created
analysisResults(result)$model.formula.genotype
# print out batch effect's significance
analysisResults(result)$model.effect.batch
# change the model
result <- testDataset(test, depVariable="Lean.Mass", equation="withWeight", callAll=FALSE)
# print out new formula
analysisResults(result)$model.formula.genotype
```
Description

This is an internal function run within TF framework. It completes the testing stage of which effects are significant. As an internal function, it doesn’t include extensive error testing of inputs. Please use cautiously if calling directly.

It creates start model and modify it after testing of different hypothesis.

The tested fixed effects are:
- batch effect (TRUE if batch variation is significant, FALSE if not),
- variance effect (TRUE if residual variances for genotype groups are homogeneous and FALSE if they are heterogeneous),
- interaction effect (TRUE if genotype by sex interaction is significant),
- sex effect (TRUE if sex is significant),
- weight effect (TRUE if weight is significant).

Usage

```r
startTFModel(phenList, depVariable, equation="withWeight", outputMessages=TRUE, pThreshold=0.05, keepList=NULL)
```

Arguments

- **phenList**: instance of the `PhenList` class; mandatory argument
- **depVariable**: a character string defining the dependent variable of interest; mandatory argument
- **equation**: a character string defining the equation to use. Possible values "withWeight" (default), "withoutWeight"
- **outputMessages**: flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE
- **pThreshold**: a numerical value for the p-value threshold used to determine which fixed effects to keep in the model, default value 0.05
- **keepList**: a logical vector defining the significance of different model effects: keep_batch, keep_equalvar, keep_weight, keep_sex, keep_interaction; default value NULL

Value

analysisResults(result)$model.formula.genotype

# print out batch effect's significance
analysisResults(result)$model.effect.batch
```

subsetText | Method "subsetText"
---|---

Description
Method `subsetText` returns full name of subset that was analysed by RR or FE framework: Males only, Females only, All.

Methods
signature(obj = "htestPhenStat")
Method "summaryOutput"

**Description**

Wrapper for the model fitting results. Returns model fitting and testing results in a user friendly format.

**Usage**

```r
summaryOutput(phenTestResult, phenotypeThreshold = 0.01)
```

**Arguments**

- `phenTestResult` instance of the `PhenTestResult` class that comes from the function `testDataset`; mandatory argument
- `phenotypeThreshold` a numerical value defining the threshold to use in classificationTag; default value 0.01

**Value**

Returns model fitting results in a text format for the screen

```
testDataset

testGenotype="Aff3/Aff3")
result2 <- testDataset(test2,
  depVariable="Thoracic.Processes",
  method="FE")
summaryOutput(result2)

---

testDataset  Method "testDataset"

Description

Statistical analysis manager function in PhenStat package.

Firstly, it performs the checks for dependent variable in the dataset. Some checks are generic, some depends on selected statistical framework/method.

Secondly, if checks are passed it runs the stages of selected framework to analyse dependent variable.

For instance, runs startModel and finalModel for the MM framework if the argument "callAll" is set to TRUE. If framework contains only one stage like in Fisher Exact Test case then runs that one stage regardless "callAll" value.

Usage

testDataset(phenList=NULL, depVariable=NULL,
  equation="withWeight", outputMessages=TRUE,
  pThreshold=0.05, method="MM", callAll=TRUE, keepList=NULL, dataPointsThreshold=4,
  RR_naturalVariation=95,RR_controlPointsThreshold=60,transformValues=FALSE,useUnfiltered=FALSE)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>phenList</td>
<td>instance of the PhenList class; mandatory argument</td>
</tr>
<tr>
<td>depVariable</td>
<td>a character string defining the dependent variable of interest; mandatory argument</td>
</tr>

<td>equation</td>
<td>a character string defining the equation to use. Possible values &quot;withWeight&quot; (default), &quot;withoutWeight&quot;</td>
</tr>
<tr>
<td>outputMessages</td>
<td>flag: &quot;FALSE&quot; value to suppress output messages; &quot;TRUE&quot; value to show output messages; default value TRUE</td>
</tr>
<tr>
<td>pThreshold</td>
<td>a numerical value for the p-value threshold used to determine which fixed effects to keep in the model, default value 0.05</td>
</tr>
<tr>
<td>method</td>
<td>a character string (&quot;MM&quot;, &quot;FE&quot; or &quot;RR&quot;) defining the method to use for model building; default value &quot;MM&quot; for mixed model</td>
</tr>
<tr>
<td>callAll</td>
<td>flag: &quot;FALSE&quot; value to run only the first stage of the selected framework; &quot;TRUE&quot; value (default) to run all stages of framework one after another</td>
</tr>
<tr>
<td>keepList</td>
<td>a logical vector defining the significance of different model effects: keep_batch, keep_equalvar, keep_weight, keep_sex, keep_interaction; default value NULL</td>
</tr>
<tr>
<td>dataPointsThreshold</td>
<td>threshold for the number of data points in the MM framework; default value is 4 ; minimal value is 2</td>
</tr>
</tbody>
</table>
testDataset

RR_naturalVariation
threshold for the variation ranges in the RR framework; default value is 95; minimal value is 60

RR_controlPointsThreshold
threshold for the number of control data points in the RR framework; default value is 60; minimal value is 40

transformValues
flag: "FALSE" value to suppress transformation; "TRUE" value to perform transformation if needed; default value FALSE

useUnfiltered
flag: "FALSE" value to use filtered dataset; "TRUE" value to use unfiltered dataset; default value FALSE

Value
Returns results stored in instance of the PhenTestResult class

summaryOutput(result3)
testFinalLRModel

Method "testFinalLRModel"

Description

Performs diagnostic tests for Logistic Regression model quality of fit. There are no arguments checks assuming that function is called internally from the "finalLRModel" function. Otherwise should be used with precaution.

Usage

testFinalLRModel(phenTestResult)

Arguments

phenTestResult instance of the PhenTestResult class that comes from the function testDataset ; mandatory argument

Value

Returns a vector with model fitting results

Author(s)

Natalja Kurbatova, Natasha Karp, Jeremy Mason

resultLR <- testDataset(testLR2,
  depVariable="V2",
  method="LR")
testFinalLRModel(resultLR)
```

---

**testFinalModel**  
*Method "testFinalModel"*

**Description**

Performs diagnostic tests for Mixed Model quality of fit. There are no arguments checks assuming that function is called internally from the "finalModel" function. Otherwise should be used with precaution.

**Usage**

```r
testFinalModel(phenTestResult)
```

**Arguments**

- `phenTestResult` instance of the `PhenTestResult` class that comes from the function `testDataset`  
  : mandatory argument

**Value**

Returns a vector with model fitting results

**Author(s)**

Natalja Kurbatova, Natasha Karp, Jeremy Mason

*PhenTestResult*
Examples

```r
gene <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
testGenotype="Sparc/Sparc")
result <- testDataset(test,
depVariable="Lean.Mass")
testFinalModel(result)
```

Description

Method `testGenotype` returns test genotype

Methods

```r
signature(obj = "PhenList")
signature(obj = "PhenTestResult")
```

TFDataset

Description

Removes of all non-concurrent batches from the dataset. Returns dataset suitable for TF framework or original dataset if data removal was not successful.

Usage

```r
TFDataset(phenList, depVariable, outputMessages=TRUE, forDecisionTree = FALSE)
```

Arguments

- `phenList`: instance of the `PhenList` class; mandatory argument
- `depVariable`: a character string defining the dependent variable of interest; mandatory argument
- `outputMessages`: flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE
- `forDecisionTree`: flag: "FALSE" value for normal procedure; "TRUE" value to indicate that is called form decisionTree function; default value FALSE

Value

Returns dataset suitable for TF framework or original dataset if data removal was not successful.

Examples

```r
file <- system.file("extdata", "test1.csv", package="PhenStat")
test <- PhenList(dataset=read.csv(file),
                 testGenotype="Sparc/Sparc")
test2 <- TFDataset(test,"Lean.Mass")
```

transformation

**Method "transformation"**

Description

Method transformation returns transformation values: lambda=value, scaleShift=value

Methods

signature(obj = "PhenTestResult")

transformationJSON

**Method "transformationJSON"**

Description

Method transformationJSON returns transformation values as JSON string

Methods

signature(obj = "PhenTestResult")

transformationText

**Method "transformationText"**

Description

Method transformationText returns transformation values as one string

Methods

signature(obj = "PhenTestResult")
vectorOutput

Method "vectorOutput"

Description

Wrapper for the model fitting results. Returns model fitting and testing results in a vector format. Assumes that modelling results are stored in the PhenTestResult object (output from function testDataset).

Usage

vectorOutput(phenTestResult, phenotypeThreshold = 0.01)

Arguments

phenTestResult  instance of the PhenTestResult class that comes from the function testDataset; mandatory argument
phenotypeThreshold a numerical value defining the threshold to use in classificationTag; default value 0.01

Value

Returns a vector with model fitting results: model output summary and other values

    depVariable="Thoracic.Processes",
    method="FE")
vectorOutput(result2)

vectorOutputMatrices  Method "vectorOutputMatrices"

Description
Returns count matrices from Fisher Exact Test framework in a vector form.
Note: Maximal supported number of dependent variable levels is 10.

Usage
vectorOutputMatrices(phenTestResult, outputMessages=TRUE)

Arguments
phenTestResult  instance of the PhenTestResult class that comes from the function testDataset; mandatory argument
outputMessages  flag: "FALSE" value to suppress output messages; "TRUE" value to show output messages; default value TRUE

Value
Returns a vector with count values.
