Package ‘RMassBank’

November 4, 2016

Type Package
Title Workflow to process tandem MS files and build MassBank records
Version 2.2.0
Author Michael Stravs, Emma Schymanski, Steffen Neumann, Erik Mueller, with contributions from Tobias Schulze
Maintainer RMassBank at Eawag <massbank@eawag.ch>
Description Workflow to process tandem MS files and build MassBank records. Functions include automated extraction of tandem MS spectra, formula assignment to tandem MS fragments, recalibration of tandem MS spectra with assigned fragments, spectrum cleanup, automated retrieval of compound information from Internet databases, and export to MassBank records.

add.formula

Calculations on molecular formulas

Description

Add, subtract, and multiply molecular formulas.

Usage

add.formula(f1, f2, as.formula = TRUE, as.list = FALSE)
multiply.formula(f1, n, as.formula = TRUE, as.list = FALSE)

Arguments

f1, f2  Molecular formulas (in list form or in text form) to calculate with.

as.formula  Return the result as a text formula (e.g. "C6H12O6"). This is the default

as.list  Return the result in list format (e.g. list(C=6, H=12, O=6)).

n  Multiplier (positive or negative, integer or non-integer.)
Details

Note that the results are not checked for plausibility at any stage, nor reordered.

Value

The resulting formula, as specified above.

Author(s)

Michael Stravs

See Also

`formula.string.to.list`, `is.valid.formula`, `order.formula`

Examples

```r
##
add.formula("C6H12O6", "C3H3")
add.formula("C6H12O6", "C-3H-3")
add.formula("C6H12O6", multiply.formula("C3H3", -1))
```

---

### addMB

**MassBank-record Addition**

Description

Adds the peaklist of a MassBank-Record to the specs of an msmsWorkspace

Usage

```r
addMB(w, cpdID, fileName, mode)
```

Arguments

- `w`: The msmsWorkspace that the peaklist should be added to.
- `cpdID`: The compoundID of the compound that has been used for the record
- `fileName`: The path to the record
- `mode`: The ionization mode that has been used to create the record

Value

The msmsWorkspace with the additional peaklist from the record

Author(s)

Erik Mueller
addPeaks

Description

Loads a table with additional peaks to add to the MassBank spectra. Required columns are cpdID, scan, int, mzFound.

Usage

addPeaks(mb, filename_or_dataframe)

Arguments

- **mb**: The mbWorkspace to load the peaks into.
- **filename_or_dataframe**: Filename of the csv file, or name of the R dataframe containing the peaklist.

Details

All peaks with OK=1 will be included in the spectra.

Value

The mbWorkspace with loaded additional peaks.

Author(s)

Michael Stravs

See Also

mbWorkflow

Examples

## Not run: addPeaks("myrun_additionalPeaks.csv")
addPeaksManually

Description

Adds a manual peaklist in matrix-format

Usage

addPeaksManually(w, cpdID, handSpec, mode)

Arguments

w
The msmsWorkspace that the peaklist should be added to.
cpdID
The compoundID of the compound that has been used for the peaklist
handSpec
A peaklist with 2 columns, one with "mz", one with "int"
mode
The ionization mode that has been used for the spectrum represented by the peaklist

Value

The msmsWorkspace with the additional peaklist added to the right spectrum

Author(s)

Erik Mueller

msmsWorkflow

Examples

## Not run:
handSpec <- cbind(mz=c(274.986685367956, 259.012401087427, 95.9493025990907, 96.9573002472772),
                  int=c(357,761, 2821, 3446))
addPeaksManually(w, cpdID, handSpec)
## End(Not run)
**addProperty**

*Add and initialize dataframe column*

**Description**

Adds a new column of a defined type to a `data.frame` and initializes it to a value. The advantage of doing this over adding it with `$` or `[,]` is that the case `nrow(o) == 0` is adequately handled and doesn't raise an error.

**Usage**

```r
addProperty(o, name, type, value = NA)
```

```r
## S4 method for signature 'data.frame,character,character'
addProperty(o, name, type,
             value = NA)
```

**Arguments**

- `o` : `data.frame` to add the column to
- `name` : Name of the new column
- `type` : Data type of the new column
- `value` : Initial value of the new column (NA if not given)

**Value**

Expanded data frame.

**Methods (by class)**

- `o = data.frame, name = character, type = character`: Add a new column to a `data.frame`

**Author(s)**

stravsmi

---

**aggregateSpectra**

*Aggregate analyzed spectra*

**Description**

Groups an array of analyzed spectra and creates aggregated peak tables

**Usage**

```r
aggregateSpectra(spec, addIncomplete=FALSE)
```
aggregateSpectra

Arguments

spec The RmbSpectraSetList of spectra sets (RmbSpectraSet objects) to aggregate
addIncomplete Whether or not the peaks from incomplete files (files for which less than the
maximal number of spectra are present)

Details

addIncomplete is relevant for recalibration. For recalibration, we want to use only high-confidence
peaks, therefore we set addIncomplete to FALSE. When we want to generate a peak list for actually
generating MassBank records, we want to include all peaks into the peak tables.

Value

A summary data.frame with all peaks (possibly multiple rows for one m/z value from a spectrum,
see below) with columns:
mzFound, intensity Mass and intensity of the peak
good if the peak passes filter criteria
mzCalc, formula, dbe, dppm calculated mass, formula, dbe and ppm deviation of the assigned formula
formulaCount, dppmBest Number of matched formulae for this m/z value, and ppm deviation of the best
match
scan, cpdID, parentScan Scan number of the child and parent spectrum in the raw file, also the compound
ID to which the peak belongs
dppmRc ppm deviation recalculated from the aggregation function
index Aggregate-table peak index, so the table can be subsetted, edited and results
reinserted back into this table easily

Further columns are later added by workflow steps 6 (electronic noise culler), 7 and 8.

Author(s)

Michael Stravs

msmsWorkflow, analyzeMsMs

Examples

## As used in the workflow:
## Not run: %
w@spectra <- lapply(w@spectra, function(spec)
analyzeMsMs(spec, mode="pH", detail=TRUE, run="recalibrated", cut=0, cut_ratio=0 ) )
w@aggregate <- aggregateSpectra(w@spectra)

## End(Not run)
analyzeMsMs

Analyze MSMS spectra

Description

Analyzes MSMS spectra of a compound by fitting formulas to each subpeak.

Usage

```r
analyzeMsMs(msmsPeaks, mode = "pH", detail = FALSE, run = "preliminary",
            filterSettings = getOption("RMassBank")$filterSettings,
            spectraList = getOption("RMassBank")$spectraList, method = "formula")
```

```r
analyzeMsMs.formula(msmsPeaks, mode = "pH", detail = FALSE,
                   run = "preliminary",
                   filterSettings = getOption("RMassBank")$filterSettings)
```

```r
analyzeMsMs.intensity(msmsPeaks, mode = "pH", detail = FALSE,
                      run = "preliminary",
                      filterSettings = getOption("RMassBank")$filterSettings)
```

Arguments

- **msmsPeaks**: A RmbSpectraSet object. Corresponds to a parent spectrum and children MSMS spectra of one compound (plus some metadata). The objects are typically generated with `findMsMsHR`, and populate the `@spectrum` slot in a msmsWorkspace (refer to the corresponding documentation for the precise format specifications).
- **mode**: Specifies the processing mode, i.e. which molecule species the spectra contain. `pH` (positive H) specifies `[M+H]`+, `pNa` specifies `[M+Na]`+, `pM` specifies `[M]+`, `mH` and `mNa` specify `[M-H]`- and `[M-Na]`-, respectively. (I apologize for the naming of `pH` which has absolutely nothing to do with chemical pH values.)
- **detail**: Whether detailed return information should be provided (defaults to `FALSE`). See below.
- **run**: "preliminary" or "recalibrated". In the preliminary run, mass tolerance is set to 10 ppm (above m/z 120) and 15 ppm (below m/z 120), the default intensity cutoff is $10^4$ for positive mode (no default cutoff in negative mode), and the column "mz" from the spectra is used as data source. In the recalibrated run, the mass tolerance is set to 5 ppm over the whole mass range, the default cutoff is 0 and the column "mzRecal" is used as source for the m/z values. Defaults to "preliminary".
- **filterSettings**: Settings for the filter parameters, by default loaded from the RMassBank settings set with e.g. `loadRmbSettings`. Must contain:
  - `ppmHighMass`, allowed ppm deviation before recalibration for high mass range
  - `ppmLowMass`, allowed ppm deviation before recalibration for low mass range
  - `massRangeDivision`, division point between high and low mass range (before recalibration)
  - `ppmFine`, allowed ppm deviation overall after recalibration
  - `prelimCut`, intensity cutoff for peaks in preliminary run
analyzeMsMs

- prelimCutRatio, relative intensity cutoff for peaks in preliminary run, e.g. 0.01 = 1
- fineCut, intensity cutoff for peaks in second run
- fineCutRatio, relative intensity cutoff for peaks in second run
- specOkLimit, minimum intensity of base peak for spectrum to be accepted for processing
- dbeMinLimit, minimum double bond equivalent for accepted molecular subformula.
- satelliteMzLimit, for satellite peak filtering (filterPeakSatellites: mass window to use for satellite removal
- satelliteIntLimit, the relative intensity below which to discard "satellites". (refer to filterPeakSatellites).

spectraList The list of MS/MS spectra present in each data block. As also defined in the settings file.

method Selects which function to actually use for data evaluation. The default "formula" runs a full analysis via formula assignment to fragment peaks. The alternative setting "intensity" calls a "mock" implementation which circumvents formula assignment and filters peaks purely based on intensity cutoffs and the satellite filtering. (In this case, the ppm and dbe related settings in filterSettings are ignored.)

Details

The analysis function uses Rcdk. Note that in this step, satellite peaks are removed by a simple heuristic rule (refer to the documentation of filterPeakSatellites for details.)

Value

The processed RmbSpectraSet object. Added (or filled, respectively, since the slots are present before) data include

list("complete")
whether all spectra have useful value
list("empty") whether there are no useful spectra
list("children")

The processed RmbSpectrum2 objects (in a RmbSpectrum2List).

- ok if the spectrum was successfully processed with at least one resulting peak
- mz, intensity: note that mz/int pairs can be duplicated when multiple matches are found for one mz value, therefore the two slots are not necessarily unchanged from before
- rawOK (logical) whether the m/z peak passes satellite/low removal
- low, satellite if TRUE, the peak failed cutoff (low) or was removed as satellite
- formula, mzCalc, dppm, dbe Formula, calculated mass, ppm deviation and dbe assigned to a peak
- formulaCount, dppmBest Number of formulae matched for this m/z value and ppm deviation of the best match
- info Spectrum identifying information (collision energy, resolution, collision mode) from the spectraList
- All other entries are retained from the original RmbSpectrum2.
Functions

- `analyzeMsMs.formula`: Analyze the peaks using formula annotation
- `analyzeMsMs.intensity`: Analyze the peaks going only by intensity values

Author(s)

Michael Stravs

`msmsWorkflow`, `filterLowaccResults`, `filterPeakSatellites`, `reanalyzeFailpeaks`

Examples

```r
## Not run: analyzed <- analyzeMsMs(spec, "pH", TRUE)
```

### annotator.default

*Generate peak annotation from peaklist*

Description

Generates the PK$ANNOTATION entry from the peaklist obtained. This function is overridable by using the "annotator" option in the settings file.

Usage

`annotator.default(annotation, type)`

Arguments

- `type`: The ion type to be added to annotated formulas ("+" or "-" usually)

Value

The annotated peak table. Table `colnames()` will be used for the titles (preferably don't use spaces in the column titles; however no format is strictly enforced by the MassBank data format.

Author(s)

Michele Stravs, Eawag <stravsmi@eawag.ch>

Examples

```r
## Not run:
annotation <- annotator.default(annotation)
## End(Not run)
```
archiveResults | Backup msmsWorkflow results

Description

Writes the results from different msmsWorkflow steps to a file.

Usage

archiveResults(w, fileName, settings = getOption("RMassBank"))

Arguments

- **w**: The msmsWorkspace to be saved.
- **fileName**: The filename to store the results under.
- **settings**: The settings to be stored into the msmsWorkspace image.

Examples

```r
# This doesn't really make a lot of sense,  
# it stores an empty workspace.
RmbDefaultSettings()
w <- newMsmsWorkspace()
archiveResults(w, "narcotics.RData")
```

checkIsotopes | Checks for isotopes in a msmsWorkspace

Description

Checks for isotopes in a msmsWorkspace

Usage

checkIsotopes(w, mode = "pH", intensity_cutoff = 0,  
intensity_precision = "none", conflict = "strict", isolationWindow = 2,  
evalMode = "complete", plotSpectrum = TRUE,  
settings = getOption("RMassBank"))

Arguments

- **w**: A msmsWorkspace to work with.
- **intensity_cutoff**: The cutoff (as an absolute intensity value) under which isotopic peaks shouldn’t be checked for or accepted as valid. Please note: The cutoff is not hard in the sense that it interacts with the intensity_precision parameter.
# checkSpectra

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>intensity_precision</td>
<td>The difference that is accepted between the calculated and observed intensity of a possible isotopic peak. Further details down below.</td>
</tr>
<tr>
<td>conflict</td>
<td>Either &quot;isotopic&quot; (Peak formulas are always chosen if they fit the requirements for an isotopic peak) or &quot;strict&quot; (Peaks are only marked as isotopic when there hasn’t been a formula assigned before.)</td>
</tr>
<tr>
<td>isolationWindow</td>
<td>Half of the width of the isolation window in Da</td>
</tr>
<tr>
<td>evalMode</td>
<td>Currently no function yet, but planned. Currently must be &quot;complete&quot;</td>
</tr>
<tr>
<td>plotSpectrum</td>
<td>A boolean specifying whether the spectrum should be plotted</td>
</tr>
<tr>
<td>settings</td>
<td>Options to be used for processing. Defaults to the options loaded via <code>loadRmbSettings</code> et al. Refer to there for specific settings.</td>
</tr>
</tbody>
</table>

## Details

Text describing parameter inputs in more detail.

- **intensity_precision**: This parameter determines how strict the intensity values should adhere to the calculated intensity in relation to the parent peak. Options for this parameter are "none", where the intensity is irrelevant, "low", which has an error margin of 70% and "high", where the error margin is set to 35%. The recommended setting is "low", but can be changed to adjust to the intensity precision of the mass spectrometer.

## Value

The `msmsWorkspace` with annotated isolation peaks

## Author(s)

Michael Stravs, Eawag <michael.stravs@eawag.ch>

Erik Mueller, UFZ

---

## Description

Checks if a specific compound (`RmbSpectraSet`) was found with child spectra in the raw file (`found`), has a complete set of MS2 spectra with useful peaks (`complete`), or is empty (note: spectra are currently not ever marked empty - empty should mean found, but no useful peaks at all. This is not yet currently tested.)

## Usage

```r
checkSpectra(s, property)
```

```r
# S4 method for signature 'RmbSpectraSet,character'
checkSpectra(s, property)
```
cleanElnoise

Arguments

s
property

The (RmbSpectraSet) to check
The property to check (found, complete or empty)

Value

TRUE or FALSE

Methods (by class)

• s = RmbSpectraSet, property = character:

Author(s)

stravsmi

cleanElnoise Remove electronic noise

Description

Removes known electronic noise peaks from a peak table

Usage

cleanElnoise(peaks, noise=getOption("RMassBank")$electronicNoise,
width = getOption("RMassBank")$electronicNoiseWidth)

Arguments

peaks
noise
width

An aggregated peak frame as described in aggregateSpectra. Columns mzFound,
dppm and dppmBest are needed.
A numeric vector of known m/z of electronic noise peaks from the instrument
Defaults to the entries in the RMassBank settings.
The window for the noise peak in m/z units. Defaults to the entries in the RMass-
Bank settings.

Value

Extends the aggregate data frame by column noise (logical), which is TRUE if the peak is marked
as noise.

Author(s)

Michael Stravs

See Also

msmsWorkflow
Examples

# As used in the workflow:
## Not run:
   w@aggregated <-
cleanElnoise(w@aggregated)
## End(Not run)

combineMultiplicities  Combine workspaces for multiplicity filtering

Description

Combines multiple msmsWorkspace items to one workspace which is used for multiplicity filtering.

Usage

combineMultiplicities(workspaces)

Arguments

workspaces  A vector of msmsWorkspace items. The first item is taken as the "authorita-
    tive" workspace, i.e. the one which will be used for the record generation. The
    subsequent workspaces will only be used for multiplicity filtering.

Details

This feature is particularly meant to be used in conjunction with the confirmMode option of
msmsWorkflow: a file can be analyzed with confirmMode = 0 (default) and subsequently with
confirmMode = 1 (take second highest scan). The second analysis should contain "the same"
spectra as the first one (but less intense) and can be used to confirm the peaks in the first spectra.
TO DO: Enable the combination of workspaces for combining e.g. multiple energy settings mea-
    sured separately.

Value

A msmsWorkspace object prepared for step 8 processing.

Author(s)

Stravs MA, Eawag <michael.stravs@eawag.ch>

See Also

msmsWorkspace-class
Examples

```r
## Not run:
w <- newMsmsWorkspace
w@files <- c("spec1", "spec2")
w1 <- msmsWorkflow(w, steps=c(1:7), mode="pH")
w2 <- msmsWorkflow(w, steps=c(1:7), mode="pH", confirmMode = 1)
wTotal <- combineMultiplicities(c(w1, w2))
wTotal <- msmsWorkflow(wTotal, steps=8, mode="pH", archivename = "output")
# continue here with mbWorkflow

## End(Not run)
```

#### compileRecord

**Compile MassBank records**

Takes a spectra block for a compound, as returned from `analyzeMsMs`, and an aggregated cleaned peak table, together with a MassBank information block, as stored in the infolists and loaded via `loadInfolist/readMbdata` and processes them to a MassBank record.

#### Usage

```r
compileRecord(spec, mbdata, aggregated, additionalPeaks = NULL, retrieval="standard")
```

#### Arguments

- **spec**
  A RmbSpectraSet for a compound, after analysis (`analyzeMsMs`). Note that **peaks are not read from this object anymore**: Peaks come from the aggregated dataframe (and from the global additionalPeaks dataframe; cf. `addPeaks` for usage information.)

- **mbdata**
  The information data block for the record header, as stored in `mbdata_relisted` after loading an infolist.

- **aggregated**
  An aggregated peak data table containing information about refiltered spectra etc.

- **additionalPeaks**
  If present, a table with additional peaks to add into the spectra. As loaded with `addPeaks`.

- **retrieval**
  A value that determines whether the files should be handled either as "standard", if the compoundlist is complete, "tentative", if at least a formula is present or "unknown" if the only know thing is the m/z

#### Details

`compileRecord` calls `gatherCompound` to create blocks of spectrum data, and finally fills in the record title and accession number, renames the "internal ID" comment field and removes dummy fields.

#### Value

Returns a MassBank record in list format: e.g. `list("ACCESSION" = "XX123456", "RECORD_TITLE" = "Cubane", ..)"`
createMolfile

Author(s)

Michael Stravs

Examples

```r
# ## Not run: myspec <- w@spectra[[2]]
# after having loaded an infolist:
# ## Not run: mbdata <- mbdata_relisted[[which(mbdata_archive$id == as.numeric(myspec$id))]]
# ## Not run: compiled <- compileRecord(myspec, mbdata, w@aggregated)
```

createMolfile

Create MOL file for a chemical structure

Description

Creates a MOL file (in memory or on disk) for a compound specified by the compound ID or by a SMILES code.

Usage

createMolfile(id_or_smiles, fileName = FALSE)

Arguments

- **id_or_smiles** The compound ID or a SMILES code.
- **fileName** If the filename is set, the file is written directly to disk using the specified file-name. Otherwise, it is returned as a text array.

Details

The function invokes OpenBabel (and therefore needs a correctly set OpenBabel path in the RMassBank settings), using the SMILES code retrieved with findSmiles or using the SMILES code directly. The current implementation of the workflow uses the latter version, reading the SMILES code directly from the MassBank record itself.

Value

A character array containing the MOL/SDF format file, ready to be written to disk.

Author(s)

Michael Stravs
CTS.externalIdSubset

Select a subset of external IDs from a CTS record.

Description

Select a subset of external IDs from a CTS record.

Usage

CTS.externalIdSubset(data, database)

Arguments

data The complete CTS record as retrieved by getCtsRecord.
database The database for which keys should be returned.

Value

Returns an array of all external identifiers stored in the record for the given database.

Author(s)

Michele Stravs, Eawag <stravsmi@eawag.ch>

Examples

## Not run:
# Benzene:
## Not run:
createMolfile("C1=CC=CC=C1")
## End(Not run)

## Not run:
# Return all CAS registry numbers stored for benzene.
data <- getCtsRecord("UHOVQNZIYRNB-UHFFFAOYSA-N")
cas <- CTS.externalIdSubset(data, "CAS")
## End(Not run)
CTS.externalIdTypes

Find all available databases for a CTS record

Description

Find all available databases for a CTS record

Usage

CTS.externalIdTypes(data)

Arguments

data  The complete CTS record as retrieved by getCtsRecord.

Value

Returns an array of all database names for which there are external identifiers stored in the record.

Author(s)

Michele Stravs, Eawag <stravsmi@eawag.ch>

Examples

```r
## Not run:
# Return all databases for which the benzene entry has
# links in the CTS record.

data <- getCTS("UHOVQNZJYSORNB-UHFFFAOYSA-N")
databases <- CTS.externalIdTypes(data)
## End(Not run)
```

dbe

Calculate Double Bond Equivalents

Description

Calculates the Ring and Double Bond Equivalents for a chemical formula. The highest valence state of each atom is used, such that the returned DBE should never be below 0.

Usage

dbe(formula)

Arguments

formula  A molecular formula in text or list representation (e.g. "C6H12O6" or list(C=6, H=12, O=6)).
Value

Returns the DBE for the given formula.

Author(s)

Michael Stravs

Examples

# dbe("C6H12O6")

deprofile

De-profile a high-resolution MS scan in profile mode.

Description

The deprofile functions convert profile-mode high-resolution input data to "centroid"-mode data amenable to i.e. centWave. This is done using full-width, half-height algorithm, spline algorithm or local maximum method.

Usage

deprofile.scan(scan, noise = NA, method = "deprofile.fwhm", colnames = TRUE, ...)
deprofile(df, noise, method, ...)
deprofile.fwhm(df, noise = NA, cut = 0.5)
deprofile.localMax(df, noise = NA)
deprofile.spline(df, noise=NA, minPts = 5, step = 0.00001)

Arguments

df A dataframe with at least the columns mz and int to perform deprofiling on.
noise The noise cutoff. A peak is not included if the maximum stick intensity of the peak is below the noise cutoff.
method "deprofile.fwhm" for full-width half-maximum or "deprofile.localMax" for local maximum.
... Arguments to the workhorse functions deprofile.fwhm etc.
scan A matrix with 2 columns for m/z and intensity; from profile-mode high-resolution data. Corresponds to the spectra obtained with xcms::getScan or mzR::peaks.
colnames For deprofile.scan: return matrix with column names (xcms-style, TRUE, default) or plain (mzR-style, FALSE).
**deprofile**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cut</td>
<td>A parameter for deprofile.fwhm indicating where the peak flanks should be taken. Standard is 0.5 (as the algorithm name says, at half maximum.) Setting cut = 0.75 would instead determine the peak width at 3/4 maximum, which might give a better accuracy for merged peaks, but could be less accurate if too few data points are present.</td>
</tr>
<tr>
<td>minPts</td>
<td>The minimal points count in a peak to build a spline; for peaks with less points the local maximum will be used instead. Note: The minimum value is 4!</td>
</tr>
<tr>
<td>step</td>

**Details**

The deprofile.fwhm method is basically an R-semantic version of the "Exact Mass" m/z deprofiler from MZmine. It takes the center between the m/z values at half-maximum intensity for the exact peak mass. The logic is stolen verbatim from the Java MZmine algorithm, but it has been rewritten to use the fast R vector operations instead of loops wherever possible. It's slower than the Java implementation, but still decently fast IMO. Using matrices instead of the data frame would be more memory-efficient and also faster, probably.

The deprofile.localMax method uses local maxima and is probably the same used by e.g. Xcalibur. For well-formed peaks, "deprofile.fwhm" gives more accurate mass results; for some applications, deprofile.localMax might be better (e.g. for fine isotopic structure peaks which are not separated by a valley and also not at half maximum.) For MS2 peaks, which have no isotopes, deprofile.fwhm is probably the better choice generally.

deprofile.spline calculates the mass using a cubic spline, as the HiRes peak detection in OpenMS does.

The word "centroid" is used for convenience to denote not-profile-mode data. The data points are NOT mathematical centroids; we would like to have a better word for it.

The noise parameter was only included for completeness, I personally don’t use it.

deprofile.fwhm and deprofile.localMax are the workhorses; deprofile.scan takes a 2-column scan as input. deprofile dispatches the call to the appropriate worker method.

**Value**

deprofile.scan: a matrix with 2 columns for m/z and intensity

**Note**

Known limitations: If the absolute leftmost stick or the absolute rightmost stick in a scan are maxima, they will be discarded! However, I don’t think this will ever present a practical problem.

**Author(s)**

Michael Stravs, Eawag <michael.stravs@eawag.ch>

**References**

mzMine source code [http://sourceforge.net/svn/?group_id=139835](http://sourceforge.net/svn/?group_id=139835)
## Examples

```r
## Not run:
mzrFile <- openMSfile("myfile.mzML")
acqNo <- xraw@acquisitionNum[[50]]
scan.mzML.profile <- mzR::peaks(mzrFile, acqNo)
scan.mzML <- deprofile.scan(scan.mzML.profile)
close(mzrFile)
```

## ExportMassbank

### Description

Exports MassBank recfile data arrays and corresponding molfiles to physical files on hard disk, for one compound.

### Usage

```r
exportMassbank(compiled, files, molfile)
```

### Arguments

- **compiled**: Is ONE "compiled" entry, i.e. ONE compound with e.g. 14 spectra, as returned from `compileRecord`.
- **files**: A n-membered array (usually a return value from `lapply(toMassbank)`), i.e. contains n plain-text arrays with MassBank records.
- **molfile**: A molfile from `createMolfile`

### Details

The data from `compiled` is still used here, because it contains the "visible" accession number. In the plain-text format contained in `files`, the accession number is not "accessible" anymore since it's in the file.

### Value

No return value.

### Note

An improvement would be to write the accession numbers into `names(compiled)` and later into `names(files)` so `compiled` wouldn't be needed here anymore. (The compound ID would have to go into `names(molfile)`, since it is also retrieved from `compiled`.)

Michael Stravs
filterLowaccResults

Filter peaks with low accuracy

Description
Filters a peak table (with annotated formulas) for accuracy. Low-accuracy peaks are removed.

Usage
filterLowaccResults(peaks, mode="fine", filterSettings = getOption("RMassBank")$filterSettings)

Arguments
- peaks: A data frame with at least the columns mzFound and dppm.
- mode: coarse or fine, see below.
- filterSettings: Settings for filtering. For details, see documentation of analyzeMsMs

Details
In the coarse mode, mass tolerance is set to 10 ppm (above m/z 120) and 15 ppm (below m/z 120).
This is useful for formula assignment before recalibration, where a wide window is desirable to accomodate the high mass deviations at low m/z values, so we get a nice recalibration curve.
In the fine run, the mass tolerance is set to 5 ppm over the whole mass range. This should be applied after recalibration.

Value
A list(TRUE = goodPeakDataframe, FALSE = badPeakDataframe) is returned: A data frame with all peaks which are "good" is in return[["TRUE"]].

analyzeMsMs, filterPeakSatellites

Examples

# from analyzeMsMs:
## Not run: childPeaksFilt <- filterLowaccResults(childPeaksInt, filterMode)

filterMultiplicity

filterMultiplicity

Description

Multiplicity filtering: Removes peaks which occur only once in a n-spectra set.

Usage

filterMultiplicity(w, archivename=NA, mode="pH", recalcBest = TRUE, multiplicityFilter = getOption("RMassBank")$multiplicityFilter)

Arguments

w
Workspace containing the data to be processed (aggregate table and RmbSpectraSet objects)

archivename
The archive name, used for generation of archivename_Failpeaks.csv

mode
Mode of ion analysis

recalcBest
Boolean, whether to recalculate the formula multiplicity after the first multiplicity filtering step. Sometimes, setting this to FALSE can be a solution if you have many compounds with e.g. fluorine atoms, which often have multiple assigned formulas per peak and might occasionally lose peaks because of that.

multiplicityFilter
Threshold for the multiplicity filter. If set to 1, no filtering will apply (minimum 1 occurrence of peak). 2 equals minimum 2 occurrences etc.

Details

This function executes multiplicity filtering for a set of spectra using the workhorse function filterPeaksMultiplicity (see details there) and retrieves problematic filtered peaks (peaks which are of high intensity but were discarded, because either no formula was assigned or it was not present at least 2x), using the workhorse function problematicPeaks. The results are returned in a format ready for further processing with mbWorkflow.
**Value**

A list object with values:

- peaksOK: Peaks with >1-fold formula multiplicity from the "normal" peak analysis.
- peaksReanOK: Peaks with >1-fold formula multiplicity from peak reanalysis.
- peaksFiltered: All peaks with annotated formula multiplicity from first analysis.
- peaksFilteredReanalysis: All peaks with annotated formula multiplicity from peak reanalysis.
- peaksProblematic: Peaks with high intensity which do not match inclusion criteria -> possible false negatives. The list will be exported into archivename_failpeaks.csv.

## Not run:
refilteredRcSpecs <- filterMultiplicity(
w, "myarchive", "pH")
## End(Not run)
```

---

**filterPeakSatellites**  
*Filter satellite peaks*

**Description**

Filters satellite peaks in FT spectra which arise from FT artifacts and from conversion to stick mode. A very simple rule is used which holds mostly true for MSMS spectra (and shouldn’t be applied to MS1 spectra which contain isotope structures...)

**Usage**

```
filterPeakSatellites(peaks, filterSettings = getOption("RMassBank")$filterSettings)
```

**Arguments**

- peaks: A peak dataframe with at least the columns `mz`, `int`. Note that `mz` is used even for the recalibrated spectra, i.e. the desatellited spectrum is identical for both the unrecalibrated and the recalibrated spectra.
- filterSettings: The settings used for filtering. Refer to `analyzeMSMs` documentation for filter settings.
Details

The function cuts off all peaks within 0.5 \( m/z \) from every peak, in decreasing intensity order, which are below 5 intensity. E.g. for peaks \( m/z=100, \text{int}=100; m/z=100.2, \text{int}=2, m/z=100.3, \text{int}=6, m/z=150, \text{int}=10 \): The most intense peak (\( m/z=100 \)) is selected, all neighborhood peaks below 5 peak) and the next less intense peak is selected. Here this is the \( m/z=150 \) peak. All low-intensity neighborhood peaks are removed (nothing). The next less intense peak is selected (\( m/z=100.3 \)) and again neighborhood peaks are cut away (nothing to cut here. Note that the \( m/z = 100.2 \) peak was already removed.)

Value

Returns the peak table with satellite peaks removed.

Note

This is a very crude rule, but works remarkably well for our spectra.

Examples

```r
# From the workflow:
## Not run:
# Filter out satellite peaks:
shot <- filterPeakSatellites(shot)
shot_satellite_n <- setdiff(row.names(shot_full), row.names(shot))
shot_satellite <- shot_full[shot_satellite_n,]
# shot_satellite contains the peaks which were eliminated as satellites.
## End(Not run)
```

filterPeaksMultiplicity

\textit{Multiplicity filtering: Removes peaks which occur only once in a n-spectra set.}

Description

For every compound, every peak (with annotated formula) is compared across all spectra. Peaks whose formula occurs only once for all collision energies / spectra types, are discarded. This eliminates "stochastic formula hits" of pure electronic noise peaks efficiently from the spectra. Note that in the author's experimental setup two spectra were recorded at every collision energy, and therefore every peak-formula should appear at least twice if it is real, even if it is by chance a fragment which appears on only one collision energy setting. The function was not tested in a different setup. Therefore, use with a bit of caution.
findEIC

Usage

filterPeaksMultiplicity(peaks, formulacol, recalcBest = TRUE)

Arguments

peaks An aggregate peak data.frame containing all peaks to be analyzed; with at least the columns cpdID, scan, mzFound and one column for the formula specified with the formulacol parameter.

formulacol Which column the assigned formula is stored in. (Needed to separately process "formula" and "reanalyzed.formula" multiplicites.)

recalcBest Whether the best formula for each peak should be re-determined. This is necessary for results from the ordinary analyzeMsMs analysis which allows multiple potential formulas per peak - the old best match could potentially have been dropped because of multiplicity filtering. For results from reanalyzeFailpeak this is not necessary, since only one potential formula is assigned in this case.

Value

The peak table is returned, enriched with columns:

• formulaMultiplicityThe # of occurrences of this formula in the spectra of its compounds.

Author(s)

Michael Stravs, EAWAG <michael.stravs@eawag.ch>

Examples

## Not run:
peaksFiltered <- filterPeaksMultiplicity(peaksMatched(w), "formula", TRUE)
peaksOK <- subset(peaksFiltered, formulaMultiplicity > 1)
## End(Not run)

findEIC

Extract EICs

Description

Extract EICs from raw data for a determined mass window.

Usage

findEIC(msRaw, mz, limit = NULL, rtLimit = NA, headerCache = NULL, floatingRecalibration = NULL, peaksCache = NULL)
findMass

Arguments

msRaw The mzR file handle
mz The mass or mass range to extract the EIC for: either a single mass (with the range specified by limit below) or a mass range in the form of c(min, max).
limit If a single mass was given for mz: the mass window to extract. A limit of 0.001 means that the EIC will be returned for [mz - 0.001, mz + 0.001].
rtLimit If given, the retention time limits in form c(rtmin, rtmax) in seconds.
headerCache If present, the complete mzR::header(msRaw). Passing this value is useful if spectra for multiple compounds should be extracted from the same mzML file, since it avoids getting the data freshly from msRaw for every compound.
floatingRecalibration A fitting function that predict()s a mass shift based on the retention time. Can be used if a lockmass calibration is known (however you have to build the calibration yourself.)
peaksCache If present, the complete output of mzR::peaks(msRaw). This speeds up the lookup if multiple compounds should be searched in the same file.

Value

A [rt, intensity, scan] matrix (scan being the scan number.)

Author(s)

Michael A. Stravs, Eawag <michael.stravs@eawag.ch>

See Also

findMsMsHR

Description

Retrieves the exact mass of the uncharged molecule. It works directly from the SMILES and therefore is used in the MassBank workflow (mbWorkflow) - there, all properties are calculated from the SMILES code retrieved from the database. (Alternatively, takes also the compound ID as parameter and looks it up.) Calculation relies on Rcdk.

Usage

findMass(cpdID_or_smiles, retrieval = "standard", mode = "pH")
**findMsMsHR**

**Arguments**

- `cpdID_or_smiles`: SMILES code or compound ID of the molecule. (Numerics are treated as compound ID).
- `retrieval`: A value that determines whether the files should be handled either as "standard", if the compound list is complete, "tentative", if at least a formula is present or "unknown" if the only known thing is the m/z.

**Value**

Returns the exact mass of the uncharged molecule.

**Author(s)**

Michael Stravs

**See Also**

`findMz`

**Examples**

```r
##
findMass("OC[C@H]1OC(O)[C@H](O)[C@@H](O)[C@@H]1O")
```

---

**Description**

Extracts MS/MS spectra from LC-MS raw data for a specified precursor, specified either via the RMassBank compound list (see `loadList`) or via a mass.

**Usage**

```r
findMsMsHR(fileName = NULL, msRaw = NULL, cpdID, mode = "pH",
            confirmMode = 0, useRtLimit = TRUE,
            ppmFine =getOption("RMassBank")$findMsMsRawSettings$ppmFine,
            mzCoarse = getOption("RMassBank")$findMsMsRawSettings$mzCoarse,
            fillPrecursorScan =getOption("RMassBank")$findMsMsRawSettings$fillPrecursorScan,
            rtMargin =getOption("RMassBank")$rtMargin,
            deprofile =getOption("RMassBank")$deprofile, headerCache = NULL,
            peaksCache = NULL, retrieval = "standard")
```

```r
findMsMsHR.mass(msRaw, mz, limit.coarse, limit.fine, rtLimits = NA,
                 maxCount = NA, headerCache = NULL, fillPrecursorScan = FALSE,
                 deprofile =getOption("RMassBank")$deprofile, peaksCache = NULL,
                 cpdID = NA)
```
findMsMsHR

Arguments

**fileName**  
The file to open and search the MS2 spectrum in.

**msRaw**  
The opened raw file (mzR file handle) to search the MS2 spectrum in. Specify either this or `fileName`.

**cpdID**  
The compound ID in the compound list (see `loadList`) to use for formula lookup. Note: In `codefindMsMsHR.mass`, this is entirely optional and used only in case a warning must be displayed; compound lookup is done via mass only.

**mode**  

**confirmMode**  
Whether to use the highest-intensity precursor (=0), second-highest (=1), third-highest (=2),...

**useRtLimit**  
Whether to respect retention time limits from the compound list.

**ppmFine**  
The limit in ppm to use for fine limit (see below) calculation.

**mzCoarse**  
The coarse limit to use for locating potential MS2 scans: this tolerance is used when finding scans with a suitable precursor ion value.

**fillPrecursorScan**  
If `TRUE`, the precursor scan will be filled from MS1 data. To be used for data where the precursor scan is not stored in the raw data.

**rtMargin**  
The retention time tolerance to use.

**deprofile**  
Whether deprofiling should take place, and what method should be used (cf. deprofile)

**headerCache**  
If present, the complete `mzR::header(msRaw)`. Passing this value is useful if spectra for multiple compounds should be extracted from the same mzML file, since it avoids getting the data freshly from `msRaw` for every compound.

**peaksCache**  
If present, the complete output of `mzR::peaks(msRaw)`. This speeds up the lookup if multiple compounds should be searched in the same file.

**retrieval**  
A value that determines whether the files should be handled either as "standard", if the compound list is complete, "tentative", if at least a formula is present or "unknown" if the only know thing is the m/z

**mz**  
The mass to use for spectrum search.

**limit.coarse**  
Parameter in `findMsMsHR.mass` corresponding to `mzCoarse`. (The parameters are distinct to clearly conceptually distinguish `findMsMsHR.mass` (a standalone useful function) from the cpdID based functions (workflow functions).)

**limit.fine**  
The fine limit to use for locating MS2 scans: this tolerance is used when locating an appropriate analyte peak in the MS1 precursor spectrum.

**rtLimits**  
`c(min, max)`: Minimum and maximum retention time to use when locating the MS2 scans.

**maxCount**  
The maximal number of spectra groups to return. One spectra group consists of all data-dependent scans from the same precursor whose precursor mass matches the specified search mass.
Details

Different versions of the function get the data from different sources. Note that findMsMsHR and findMsMsHR.direct differ mainly in that findMsMsHR opens a file whereas findMsMs.direct uses an open file handle - both are intended to be used in a full process which involves compound lists etc. In contrast, findMsMsHR.mass is a low-level function which uses the mass directly for lookup and is intended for use as a standalone function in unrelated applications.

Value

An RmbSpectraSet (for findMsMsHR). Contains parent MS1 spectrum (@parent), a block of dependent MS2 spectra (@children) and some metadata (id,mz,name,mode in which the spectrum was acquired.

For findMsMsHR.mass: a list of RmbSpectraSets as defined above, sorted by decreasing precursor intensity.

Functions

- findMsMsHR.mass: A submethod of find MsMsHR that retrieves basic spectrum data

Note

findMsMs.direct is deactivated

Author(s)

Michael A. Stravs, Eawag <michael.stravs@eawag.ch>

findEIC

Examples

```r
## Not run:
loadList("mycompoundlist.csv")
# if Atrazine has compound ID 1:
msms_atrazine <- findMsMsHR(fileName = "Atrazine_0001_pos.mzML", cpdID = 1, mode = "pH")
# Or alternatively:
msRaw <- openMSfile("Atrazine_0001_pos.mzML")
msms_atrazine <- findMsMsHR(msRaw=msRaw, cpdID = 1, mode = "pH")
# Or directly by mass (this will return a list of spectra sets):
mz <- findMz(1)$mzCenter
msms_atrazine_all <- findMsMsHR.mass(msRaw, mz, 1, ppm(msRaw, 10, p=TRUE))
msms_atrazine <- msms_atrazine_all[[1]]
## End(Not run)
```
Description

This interface has been discontinued. `findMsMsHR` now supports the same parameters (use named parameters).

Usage

```r
findMsMsHR.direct(msRaw, cpdID, mode = "pH", confirmMode = 0,
useRtLimit = TRUE,
ppmFine = getOption("RMassBank")$findMsMsRawSettings$ppmFine,
mzCoarse = getOption("RMassBank")$findMsMsRawSettings$mzCoarse,
fillPrecursorScan = getOption("RMassBank")$findMsMsRawSettings$fillPrecursorScan,
rtMargin = getOption("RMassBank")$rtMargin,
deprofile = getOption("RMassBank")$deprofile, headerCache = NULL)
```

Arguments

- `msRaw` x
- `cpdID` x
- `mode` x
- `confirmMode` x
- `useRtLimit` x
- `ppmFine` x
- `mzCoarse` x
- `fillPrecursorScan` x
- `rtMargin` x
- `deprofile` x
- `headerCache` x

Value

an error

Author(s)

stravsmi
**Description**

Extract an MS/MS spectrum or multiple MS/MS spectra based on the TIC of the MS2 and precursor mass, picking the most intense MS2 scan. Can be used, for example, to get a suitable MS2 from direct infusion data which was collected with purely targeted MS2 without MS1.

**Usage**

```r
defindMsMsHR.ticms2(msRaw, mz, limit.coarse, limit.fine, rtLimits = NA, maxCount = NA, headerCache = NULL, fillPrecursorScan = FALSE, deprofile = getOption("RMassBank")$deprofile, trace = "ms2tic")
```

**Arguments**

- `msRaw`: The mzR raw file
- `mz`: Mass to find
- `limit.coarse`: Allowed mass deviation for scan precursor (in m/z values)
- `limit.fine`: Unused here, but present for interface compatibility with findMsMsHR
- `rtLimits`: Unused here, but present for interface compatibility with findMsMsHR
- `maxCount`: Maximal number of spectra to return
- `headerCache`: Cached results of header(msRaw), either to speed up the operations or to operate with preselected header() data
- `fillPrecursorScan`: Unused here, but present for interface compatibility with findMsMsHR
- `deprofile`: Whether deprofiling should take place, and what method should be used (cf. deprofile)
- `trace`: Either "ms2tic" or "ms2basepeak": Which intensity trace to use - can be either the TIC of the MS2 or the basepeak intensity of the MS2.

**Details**

Note that this is not a precise function and only really makes sense in direct infusion and if the precursor is really known, because MS2 precursor data is only "roughly" accurate (to 2 dp). The regular findMsMsHR functions confirm the exact mass of the precursor in the MS1 scan.

**Value**

A list of "spectrum sets" as defined in `findMsMsHR`, sorted by decreasing precursor intensity.

**Author(s)**

stravsmi
findMsMsHRperxcms

Read in mz-files using XCMS

Description

Picks peaks from mz-files and returns the pseudospectra that CAMERA creates with the help of XCMS

Usage

findMsMsHRperxcms(fileName, cpdID, mode = "pH", findPeaksArgs = NULL, plots = FALSE, MSe = FALSE)

findMsMsHRperxcms.direct(fileName, cpdID, mode = "pH", findPeaksArgs = NULL, plots = FALSE, MSe = FALSE)

Arguments

fileName          The path to the mz-file that should be read
cpdID             The compoundID(s) of the compound that has been used for the file
mode              The ionization mode that has been used for the spectrum represented by the peaklist
findPeaksArgs     A list of arguments that will be handed to the xcms-method findPeaks via do.call
plots             A parameter that determines whether the spectra should be plotted or not
MSe               A boolean value that determines whether the spectra were recorded using MSe or not

Value

The spectra generated from XCMS

Functions

• findMsMsHRperxcms.direct: A submethod of findMsMsHRperxcms that retrieves basic spectrum data

Author(s)

Erik Mueller

msmsWorkflow toRMB

Examples

## Not run:
fileList <- list.files(system.file("XCMSinput", package = "RMassBank"), "Glucolesquerellin", full.names=TRUE)
loadlist(system.file("XCMSinput/compoundList.csv",package="RMassBank"))
psp <- findMsMsHRperxcms(fileList,2184)

## End(Not run)
Description

Retrieves compound information from the loaded compound list or calculates it from the SMILES code in the list.

Usage

findMz(cpdID, mode = "pH", ppm = 10, deltaMz = 0, retrieval="standard")
findRt(cpdID)
findSmiles(cpdID)
findFormula(cpdID, retrieval="standard")
findCAS(cpdID)
findName(cpdID)
findLevel(cpdID, compact=FALSE)

Arguments

cpdID  The compound ID in the compound list.
mode  Specifies the species of the molecule: An empty string specifies uncharged monoisotopic mass, pH (positive H) specifies [M+H]+, pNa specifies [M+Na]+, pM specifies [M]+, mH and mFA specify [M-H]- and [M+FA]-, respectively. (I apologize for the naming of pH which has absolutely nothing to do with chemical pH values.)
ppm  Specifies ppm window (10 ppm will return the range of the molecular mass + and - 10 ppm).
deltaMz  Specifies additional m/z window to add to the range (deltaMz = 0.02 will return the range of the molecular mass +/- 0.02 (and additionally +/- the set ppm value).
retrieval  A value that determines whether the files should be handled either as "standard", if the compoundlist is complete, "tentative", if at least a formula is present or "unknown" if the only know thing is the m/z
compact  Only for findLevel, returns the "retrieval" parameter used for many functions within RMassBank if TRUE

Value

findMz will return a list(mzCenter=, mzMin=, mzMax=) with the molecular weight of the given ion, as calculated from the SMILES code and Rcdk.
findRt, findSmiles, findCAS, findName will return the corresponding entry from the compound list. findFormula returns the molecular formula as determined from the SMILES code.
findMz.formula

findFormula(123)
## End(Not run)

---

findMz.formula  
Find the exact mass +/- a given margin for a given formula or its ions and adducts.

Description

Find the exact mass +/- a given margin for a given formula or its ions and adducts.

Usage

findMz.formula(formula, mode = "pH", ppm = 10, deltaMz = 0)

Arguments

- **formula**: The molecular formula in text or list format (see `formulaString.to.list`
- **ppm**: The ppm margin to add/subtract
- **deltaMz**: The absolute mass to add/subtract. Cumulative with ppm

Value

A list(mzMin=, mzCenter=, mzMax=) with the masses.

Author(s)

Michael A. Stravs, Eawag <michael.stravs@eawag.ch>

See Also

findMz

Examples

findMz.formula("C6H6")
findProgress

**Determine processed steps**

**Description**

This function reads out the content of different slots of the workspace object and finds out which steps have already been processed on it.

**Usage**

```r
findProgress(workspace)
```

**Arguments**

- `workspace`: A `msmsWorkspace` object.

**Value**

An array containing all `msmsWorkflow` steps which have likely been processed.

**Author(s)**

Stravs MA, Eawag <michael.stravs@eawag.ch>

**Examples**

```r
## Not run:
findProgress(w)
## End(Not run)
```

flatten

**Flatten, or re-read, MassBank header blocks**

**Description**

`flatten` converts a list of MassBank compound information sets (as retrieved by `gatherData`) to a flat table, to be exported into an `infolist`. `readMbdata` reads a single record from an infolist flat table back into a MassBank (half-)entry.

**Usage**

```r
flatten(mbdata)
readMbdata(row)
```

**Arguments**

- `mbdata`: A list of MassBank compound information sets as returned from `gatherData`.
- `row`: One row of MassBank compound information retrieved from an infolist.
Neither the flattening system itself nor the implementation are particularly fantastic, but since hand-checking of records is a necessary evil, there is currently no alternative (short of coding a complete GUI for this and working directly on the records.)

**Value**

- `flatten` returns a matrix (not a data frame) to be written to CSV.
- `readMbdata` returns a list of type `list(id= compoundID, ..., 'ACCESSION' = '', 'RECORD_TITLE' = '')`, etc.

**Author(s)**

Michael Stravs

**References**

**See Also**

- `gatherData`, `loadInfolist`

**Examples**

```r
## Not run:
# Collect some data to flatten
ids <- c(40,50,60,70)
    data <- lapply(ids, gatherData)
# Flatten the data trees to a table
flat.table <- flatten(data)
# reimport the table into a tree
data.reimported <- apply(flat.table, 1, readMbdata)

## End(Not run)
```

---

**formulastring.to.list**

*Interconvert molecular formula representations*

**Description**

Converts molecular formulas from string to list representation or vice versa.

**Usage**

- `list.to.formula(flist)`
- `formulastring.to.list(formula)`
Arguments

    formula     A molecular formula in string format, e.g. "C6H12O6".
    flist       A molecular formula in list format, e.g. list( "C" = 6, "H" = 12, "O" = 6 ).

Details

The function doesn't care about whether your formula makes sense. However, "C3.5O4" will give list("C" = 3, "O" = 4) because regular expressions are used for matching (however, list("C" = 3.5, "O" = 4) gives "C3.5O4"). Duplicate elements cause problems; only "strict" molecular formulas ("CH4O", but not "CH3OH") work correctly.

Value

    list.to.formula returns a string representation of the formula; formulastring.to.list returns the list representation.

Author(s)

    Michael Stravs

See Also

    add.formula, order.formula, is.valid.formula

Examples

    #
    list.to.formula(list("C" = 4, "H" = 12))
    # This is also OK and useful to calculate e.g. adducts or losses.
    list.to.formula(list("C" = 4, "H" = -1))
    formulastring.to.list(list.to.formula(formulastring.to.list("CHIBr")))

---

gatherCompound (Compose data block of MassBank record)

descrition

gatherCompound composes the data blocks (the "lower half") of all MassBank records for a compound, using the annotation data in the RMassBank options, spectrum info data from the analyzedSpec-type record and the peaks from the reanalyzed, multiplicity-filtered peak table. It calls gatherSpectrum for each child spectrum.

Usage

gatherCompound(spec, aggregated, additionalPeaks = NULL, retrieval="standard")

gatherSpectrum(spec, msmsdata, ac_ms, ac_lc, aggregated, additionalPeaks = NULL, retrieval="standard")
Arguments

spec A RmbSpectraSet object, representing a compound with multiple spectra.
gatherCompound
aggregated An aggregate peak table where the peaks are extracted from.
additionalPeaks If present, a table with additional peaks to add into the spectra. As loaded with
addPeaks.
retrieval A value that determines whether the files should be handled either as "standard",
if the compoundlist is complete, "tentative", if at least a formula is present or
"unknown" if the only know thing is the m/z
msmsdata A RmbSpectrum2 object from the spec spectra set, representing a single spec-
trum to give a record.
ac_ms, ac_lc Information for the AC$MASS_SPECTROMETRY and AC$CHROMATOGRAPHY
fields in the MassBank record, created by gatherCompound and then fed into
gatherSpectrum.

details

The returned data blocks are in format list( "AC$MASS_SPECTROMETRY" = list('FRAGMENTATION_MODE' = 'CID', ...

Value

gatherCompound returns a list of tree-like MassBank data blocks. gatherSpectrum returns one
single MassBank data block or NA if no useful peak is in the spectrum.

Note

Note that the global table additionalPeaks is also used as an additional source of peaks.

Examples

## Not run:

```R
gatherCompound <- w@spectra[[1]]
msbankdata <- gatherCompound(myspectrum, w@aggregated)
# Note: ac_lc and ac_ms are data blocks usually generated in gatherCompound and
# passed on from there. The call below gives a relatively useless result :)
ac_lc_dummy <- list()
ac_ms_dummy <- list()
justOneSpectrum <- gatherSpectrum(myspectrum, myspectrum@child[[2]],
ac_ms_dummy, ac_lc_dummy, w@aggregated)
```
gatherData

## End(Not run)

gatherData Retrieve annotation data

Description

Retrieves annotation data for a compound from the internet services CTS, Pubchem, Chemspider and Cactvs, based on the SMILES code and name of the compounds stored in the compound list.

Usage

gatherData(id)

Arguments

id The compound ID.

Details

Composes the "upper part" of a MassBank record filled with chemical data about the compound: name, exact mass, structure, CAS no., links to PubChem, KEGG, ChemSpider. The instrument type is also written into this block (even if not strictly part of the chemical information). Additionally, index fields are added at the start of the record, which will be removed later: id, dbcas, dbname from the compound list, dataused to indicate the used identifier for CTS search (smiles or dbname).

Additionally, the fields ACCESSION and RECORD_TITLE are inserted empty and will be filled later on.

Value

Returns a list of type list(id= compoundID, ..., 'ACCESSION' = '', 'RECORD_TITLE' = '', ) etc.

Author(s)

Michael Stravs

mbWorkflow
Examples

```r
# Gather data for compound ID 131
## Not run: gatherDataBabel(131)
```

---

**gatherDataBabel**  
*Retrieve annotation data*

**Description**

Retrieves annotation data for a compound by using babel, based on the SMILES code and name of the compounds stored in the compound list.

**Usage**

```r
gatherDataBabel(id)
```

**Arguments**

- **id**  
The compound ID.

**Details**

Composes the "upper part" of a MassBank record filled with chemical data about the compound: name, exact mass, structure, CAS no.. The instrument type is also written into this block (even if not strictly part of the chemical information). Additionally, index fields are added at the start of the record, which will be removed later: id, dbcas, dbname from the compound list.

Additionally, the fields ACCESSION and RECORD_TITLE are inserted empty and will be filled later on.

This function is an alternative to gatherData, in case CTS is down or if information on one or more of the compounds in the compound list are sparse.

**Value**

Returns a list of type list(id= compoundID, ..., 'ACCESSION' = '', 'RECORD_TITLE' = '', ) etc.

**Author(s)**

Michael Stravs, Erik Mueller

`mbWorkflow`
gatherDataUnknown

Examples

```r
# Gather data for compound ID 131
## Not run: gatherDataBabel(131)
```

<table>
<thead>
<tr>
<th>gatherDataUnknown</th>
<th>Retrieve annotation data</th>
</tr>
</thead>
</table>

Description

Retrieves annotation data for an unknown compound by using basic information present

Usage

```r
gatherDataUnknown(id, mode, retrieval)
```

Arguments

- **id**: The compound ID.
- **retrieval**: A value that determines whether the files should be handled either as "standard", if the compoundlist is complete, "tentative", if at least a formula is present or "unknown" if the only know thing is the m/z

Details

Composes the "upper part" of a MassBank record filled with chemical data about the compound: name, exact mass, structure, CAS no.. The instrument type is also written into this block (even if not strictly part of the chemical information). Additionally, index fields are added at the start of the record, which will be removed later: id, dbcas, dbname from the compound list.

Additionally, the fields ACCESSION and RECORD_TITLE are inserted empty and will be filled later on.

This function is used to generate the data in case a substance is unknown, i.e. not enough information is present to derive anything about formulas or links

Value

Returns a list of type `list(id = compoundID, ..., 'ACCESSION' = '', 'RECORD_TITLE' = '', )` etc.

Author(s)

Michael Stravs, Erik Mueller

References

**gatherPubChem**

Retrieve supplemental annotation data from Pubchem

**Description**

Retrieves annotation data for a compound from the internet service Pubchem based on the inchikey generated by babel or Cactus

**Usage**

gatherPubChem(key)

**Arguments**

- **key**: An Inchi-Key

**Details**

The data retrieved is the Pubchem CID, a synonym from the Pubchem database, the IUPAC name (using the preferred if available) and a Chebi link

**Value**

Returns a list with 4 slots:
- **PcID**: The Pubchem CID
- **Synonym**: An arbitrary synonym for the compound name
- **IUPAC**: An IUPAC-name (preferred if available)
- **Chebi**: The identification number of the chebi database

### Examples

# Gather data for compound ID 131
## Not run: gatherDataUnknown(131,"pH")
getCactus

Examples

# Gather data for compound ID 131
## Not run: gatherPubChem("QEIXBXXKTUNWDK-UHFFFAOYSA-N")

getCactus

Retrieves information from the Cactus Chemical Identifier Resolver (PubChem).

Usage

getCactus(identifier, representation)

Arguments

identifier
Any identifier interpreted by the resolver, e.g. an InChI key or a SMILES code.

representation
The desired representation, as required from the resolver. e.g. stdinchikey, chemspider_id, formula... Refer to the webpage for details.

Details

It is not necessary to specify in which format the identifier is. Somehow, cactus does this automatically.

Value

The result of the query, in plain text. Can be NA, or one or multiple lines (character array) of results.

Note

Note that the InChI key is retrieved with a prefix (InChIkey=), which must be removed for most database searches in other databases (e.g. CTS).

Author(s)

Michael Stravs

See Also

getCtsRecord, getPcId
getCSID

Retrieve the Chemspider ID for a given compound

Description

Given an InChIKey, this function queries the chemspider web API to retrieve the Chemspider ID of the compound with that InChIKey.

Usage

getCSID(query)

Arguments

query  The InChIKey of the compound

Value

Returns the chemspider

Author(s)

Michele Stravs, Eawag <stravsmi@eawag.ch>

Erik Mueller, UFZ <erik.mueller@ufz.de>

Examples

## Not run:
# Return all CAS registry numbers stored for benzene.
data <- getCtsRecord("UHOVQNZIYSQRNB-UHFFFAOYSA-N")
cas <- CTS.externalIdSubset(data, "CAS")

## End(Not run)
**getCtsKey**

*Convert a single ID to another using CTS.*

**Description**

Convert a single ID to another using CTS.

**Usage**

```r
getctskey(query, from = "Chemical Name", to = "InChIKey")
```

**Arguments**

- `query` : ID to be converted
- `from` : Type of input ID
- `to` : Desired output ID

**Value**

An unordered array with the resulting converted key(s).

**Author(s)**

Michele Stravs, Eawag <stravsmi@eawag.ch>

**Examples**

```r
k <- getcctskey("benzene", "Chemical Name", "InChIKey")
```

---

**getCtsRecord**

*Retrieve information from CTS*

**Description**

Retrieves a complete CTS record from the InChI key.

**Usage**

```r
getcstr(record(key)
```

**Arguments**

- `key` : The InChI key.

**Value**

Returns a list with all information from CTS: `inchikey`, `inchicode`, `formula`, `exactmass` contain single values. `synonyms` contains an unordered list of scored synonyms (`type`, `name`, `score`, where `type` indicates either a normal name or a specific IUPAC name, see below). `externalIds` contains an unordered list of identifiers of the compound in various databases (`name`, `value`, where `name` is the database name and `value` the identifier in that database).
Note

Currently, the CTS results are still incomplete; the name scores are all 0, formula and exact mass return zero.

Author(s)

Michele Stravs, Eawag <stravsmi@eawag.ch>

References

Chemical Translation Service: http://cts.fiehnlab.ucdavis.edu

Examples

data <- getCtsRecord("UHOVQNJYSQRNB-UHFFFAOYSA-N")
# show all synonym "types"
types <- unique(unlist(lapply(data$synonyms, function(i) i$type)))
## Not run: print(types)

---

**getDescription**

Get data frame with all present peak data

Description

Returns a data frame with columns for all non-empty slots in a RmbSpectrum2 object. Note that MSnbase::Spectrum has a method as.data.frame, however that one will return only mz, intensity. This function is kept separate to ensure downwards compatibility since it returns more columns than MSnbase as.data.frame.

Usage

```r
## S4 method for signature 'RmbSpectrum2'
getDescription(s)
```

Arguments

- `s` The RmbSpectrum2 object to extract data from.

Value

A data frame with columns for every set slot.

Author(s)

stravsmi
getMolecule

Create Rdk molecule from SMILES

Description

Generates a Rdk molecule object from SMILES code, which is fully typed and usable (in contrast to the built-in parse.smiles).

Usage

getMolecule(smiles)

Arguments

smiles The SMILES code of the compound.

Details

NOTE: As of today (2012-03-16), Rdk discards stereochemistry when loading the SMILES code! Therefore, do not trust this function blindly, e.g. don’t generate InChI keys from the result. It is, however, useful if you want to compute the mass (or something else) with Rdk.

Value

A Rdk IAtomContainer reference.

Author(s)

Michael Stravs

parse.smiles

Examples

# Lindane:
getcMolecule("C1(C(C(C1C1)1)C1(C1)1)C1")
# Benzene:
getcMolecule("C1=CC=CC1")
getPcId

Search Pubchem CID

Description
Retrieves PubChem CIDs for a search term.

Usage
getPcId(query, from = "inchikey")

Arguments
- query: ID to be converted
- from: Type of input ID

Details
Only the first result is returned currently. The function should be regarded as experimental and has not thoroughly been tested.

Value
The PubChem CID (in string type).

Author(s)
Michael Stravs, Erik Mueller

References

See Also
getCtsRecord, getCactus

Examples
getPcId("MKXZASYAUSDLOCJ-NJAFLHGGS-N")
is.valid.formula  

**Check validity of formula**

**Description**

Checks whether the formula is chemically valid, i.e. has no zero-count or negative-count elements.

**Usage**

```r
is.valid.formula(formula)
```

**Arguments**

- `formula`  
  A molecular formula in string or list representation ("C6H6" or list(C=6,H=6)).

**Details**

The check is only meant to identify formulas which have negative elements, which can arise from the subtraction of adducts. It is **not** a high-level formula "validity" check like e.g. the Rdkg function `isvalid.formula` which uses the nitrogen rule or a DBE rule.

**Author(s)**

Michael Stravs

**See Also**

- `list.to.formula`, `add.formula`, `order.formula`

**Examples**

```r
#  
is.valid.formula(list(C=0,H=1,Br=2))
is.valid.formula("CH2Cl")
is.valid.formula("C0H2")
```

---

loadInfolists  

**Load MassBank compound information lists**

**Description**

Loads MassBank compound information lists (i.e. the lists which were created in the first two steps of the MassBank `mbWorkflow` and subsequently edited by hand.).
Usage

loadInfolists(mb, path)

loadInfolist(mb, fileName)

resetInfolists(mb)

Arguments

mb The mbWorkspace to load/reset the lists in.
path Directory in which the namelists reside. All CSV files in this directory will be loaded.
fileName A single namelist to be loaded.

Details

resetInfolists clears the information lists, i.e. it creates a new empty list in mbdata_archive. loadInfolist loads a single CSV file, whereas loadInfolists loads a whole directory.

Value

The new workspace with loaded/reset lists.

Author(s)

Michael Stravs

Examples

#
## Not run: mb <- resetInfolists(mb)
mb <- loadInfolist(mb, "my_csv_infolist.csv")
## End(Not run)

loadList

Load compound list for RMassBank

Description

Loads a CSV compound list with compound IDs

Usage

loadList(path, listEnv=NULL, check=TRUE)

resetList()
makeMollist

Arguments

<table>
<thead>
<tr>
<th>Path</th>
<th>Path to the CSV list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>listEnv</td>
<td>The environment to load the list into. By default, the namelist is loaded into an environment internally in RMassBank.</td>
</tr>
<tr>
<td>check</td>
<td>A parameter that specifies whether the SMILES-Codes in the list should be checked for readability by rcdk.</td>
</tr>
</tbody>
</table>

Details

The list is loaded into the variable compoundList in the environment listEnv (which defaults to the global environment) and used by the findMz, findCAS, ... functions. The CSV file is required to have at least the following columns, which are used for further processing and must be named correctly (but present in any order): ID, Name, SMILES, RT, CAS

resetList() clears a currently loaded list.

Value

No return value.

Author(s)

Michael Stravs

See Also

findMz

Examples

```r
## Not run: loadList("mylist.csv")
```
**makePeaksCache**

**Details**

Generates the list.tsv file which is needed by MassBank to connect records with their respective molfiles. The first compound name is linked to a mol-file with the compound ID (e.g. 2334.mol for ID 2334).

**Value**

No return value.

**Author(s)**

Michael A. Stravs, Eawag <michael.stravs@eawag.ch>

**Examples**

```r
## Not run:
compiled <- compileRecord(record, mbdata, refilteredRcSpecs)
# a list.tsv for only one record:
clist <- list(compiled)
makeMollist(clist)
## End(Not run)
```

---

**makePeaksCache**  
*Generate peaks cache*

**Description**

Generates a peak cache table for use with `findMsMsHR` functions.

**Usage**

```r
makePeaksCache(msRaw, headerCache)
```

**Arguments**

- `msRaw`: the input raw datafile (opened)
- `headerCache`: the cached header, or subset thereof for which peaks should be extracted. Peak extraction goes by `seqNum`.

**Value**

A list of dataframes as from `mzR::peaks`.

**Author(s)**

stravsmi
**makeRecalibration**  
Recalibrate MS/MS spectra

**Description**
Recalibrates MS/MS spectra by building a recalibration curve of the assigned putative fragments of all spectra in `aggregatedSpecs` (measured mass vs. mass of putative associated fragment) and additionally the parent ion peaks.

**Usage**

```r
makeRecalibration(w, mode,  
  recalibrateBy = getOption("RMassBank")$recalibrateBy,  
  recalibrateMS1 = getOption("RMassBank")$recalibrateMS1,  
  recalibrator = getOption("RMassBank")$recalibrator,  
  recalibrateMS1Window = getOption("RMassBank")$recalibrateMS1Window)

recalibrateSpectra(mode, rawspec = NULL, rc = NULL, rc.ms1=NULL, w = NULL,  
  recalibrateBy = getOption("RMassBank")$recalibrateBy,  
  recalibrateMS1 = getOption("RMassBank")$recalibrateMS1)

recalibrateSingleSpec(spectrum, rc,  
  recalibrateBy = getOption("RMassBank")$recalibrateBy)
```

**Arguments**

- `w`  
  For `makeRecalibration`: to perform the recalibration with. For `recalibrateSpectra`: the `msmsWorkspace` which contains the recalibration curves (alternatively to specifying `rc`, `rc.ms1`).

- `mode`  

- `recalibrateBy`  
  Whether recalibration should be done by ppm ("ppm") or by m/z ("mz").

- `recalibrateMS1`  
  Whether MS1 spectra should be recalibrated separately ("separate"), together with MS2 ("common") or not at all ("none"). Usually taken from settings.

- `recalibrator`  
  The recalibrator functions to be used. Refer to `recalibrate` for details. Usually taken from settings.

- `recalibrateMS1Window`  
  Window width to look for MS1 peaks to recalibrate (in ppm).

- `spectrum`  
  For `recalibrateSingleSpec`: an `Mnbase` Spectrum-derived object, commonly an `RmbSpectrum2` for MS2 or `Spectrum1` for MS1.

- `rawspec`  
  For `recalibrateSpectra`: an `RmbSpectraSetList` of `RmbSpectraSet` objects, as the `w@spectra` slot from `msmsWorkspace` or any object returned by `findMsMsHR`. If empty, no spectra are recalibrated, but the recalibration curve is returned.

- `rc`, `rc.ms1`  
  The recalibration curves to be used in the recalibration.
Details

Note that the actually used recalibration functions are governed by the general MassBank settings (see recalibrate).

If a set of acquired LC-MS runs contains spectra for two different ion types (e.g. [M+H]+ and [M+Na]+) which should both be processed by RMassBank, it is necessary to do this in two separate runs. Since it is likely that one ion type will be the vast majority of spectra (e.g. most in [M+H]+ mode), and only few spectra will be present for other specific adducts (e.g. only few [M+Na]+ spectra), it is possible that too few spectra are present to build a good recalibration curve using only e.g. the [M+Na]+ ions. Therefore we recommend, for one set of LC/MS runs, to build the recalibration curve for one ion type (`msmsWorkflow(mode="pH", steps=c(1:8), newRecalibration=TRUE)`) and reuse the same curve for processing different ion types (`msmsWorkflow(mode="pNa", steps=c(1:8), newRecalibration=FALSE)`). This also ensures a consistent recalibration across all spectra of the same batch.

Value

- **makeRecalibration**: a list(`rc, rc.ms1`) with recalibration curves for the MS2 and MS1 spectra.
- **recalibrateSpectra**: if `rawspec` is not NULL, returns the recalibrated spectra as `RmbSpectraSetList`. All spectra have their mass recalibrated and evaluation data deleted.
- **recalibrateSingleSpec**: the recalibrated `Spectrum` (same object, recalibrated masses, evaluation data like assigned formulae etc. deleted).

Author(s)

Michael Stravs, Eawag <michael.stravs@eawag.ch>

Examples

```r
## Not run:
rcCurve <- recalibrateSpectra(w, "pH")
w@spectra <- recalibrateSpectra(mode="pH", rawspec=w@spectra, w=myWorkspace)
w@spectra <- recalibrateSpectra(mode="pH", rawspec=w@spectra,rcCurve$rc, rcCurve$rc.ms1)
## End(Not run)
```

---

**mbWorkflow**  
*MassBank record creation workflow*

**Description**

Uses data generated by `msmsWorkflow` to create MassBank records.

**Usage**

```r
mbWorkflow(mb, steps = c(1, 2, 3, 4, 5, 6, 7, 8),
   infolist_path = "/infolist.csv", gatherData = "online")
```
Arguments

\textbf{mb} \hspace{1cm} The \texttt{mbWorkspace} to work in.

\textbf{steps} \hspace{1cm} Which steps in the workflow to perform.

\textbf{infolist\_path} \hspace{1cm} A path where to store newly downloaded compound informations, which should then be manually inspected.

\textbf{gatherData} \hspace{1cm} A variable denoting whether to retrieve information using several online databases \texttt{gatherData= "online"} or to use the local babel installation \texttt{gatherData= "babel"}. Note that babel is used either way, if a directory is given in the settings. This setting will be ignored if retrieval is set to "standard".

Details

See the vignette \texttt{vignette("RMassBank")} for detailed informations about the usage.

Steps:

Step 1: Find which compounds don't have annotation information yet. For these compounds, pull information from several databases (using \texttt{gatherData}).

Step 2: If new compounds were found, then export the \texttt{infolist.csv} and stop the workflow. Otherwise, continue.

Step 3: Take the archive data (in table format) and reformat it to MassBank tree format.

Step 4: Compile the spectra. Using the skeletons from the archive data, create MassBank records per compound and fill them with peak data for each spectrum. Also, assign accession numbers based on scan mode and relative scan no.

Step 5: Convert the internal tree-like representation of the MassBank data into flat-text string arrays (basically, into text-file style, but still in memory)

Step 6: For all OK records, generate a corresponding molfile with the structure of the compound, based on the SMILES entry from the MassBank record. (This molfile is still in memory only, not yet a physical file)

Step 7: If necessary, generate the appropriate subdirectories, and actually write the files to disk.

Step 8: Create the list.tsv in the molfiles folder, which is required by MassBank to attribute substances to their corresponding structure molfiles.

Value

The processed \texttt{mbWorkspace}.

Author(s)

Michael A. Stravs, Eawag <michael.stravs@eawag.ch>

See Also

\texttt{mbWorkspace-class}

Examples

```r
## Not run:
mb <- newMbWorkspace(w) # w being a \texttt{msmsWorkspace}
mb <- loadInfolists(mb, "D:/myInfolistPath")
mb <- mbWorkflow(mb, steps=c(1:3), "newinfos.csv")
```
Description

A workspace which stores input and output data for use with mbWorkflow.

Usage

```r
## S4 method for signature 'mbWorkspace'
show(object)
```

Arguments

- `object` The mbWorkspace to display.

Details

Slots:

- `spectra, aggregated` The corresponding input data from msmsWorkspace-class
- `additionalPeaks` A list of additional peaks which can be loaded using addPeaks.
- `mbdata, mbdata_archive, mbdata_relisted` Infolist data: Data for annotation of MassBank records, which can be loaded using loadInfolists.
- `compiled, compiled_ok` Compiled tree-structured MassBank records. compiled_ok contains only the compounds with at least one valid spectrum.
- `mbfiles` Compiled MassBank records in text representation.
- `molfile` MOL files with the compound structures.
- `ok, problems` Index lists for internal use which denote which compounds have valid spectra.

Methods:

- `show` Shows a brief summary of the object. Currently only a stub.

mbWorkflow
msmsRead

Extracts and processes spectra from a specified file list, according to loaded options and given parameters.

Description

The filenames of the raw LC-MS runs are read from the array files in the global environment. See the vignette "RMassBank" for further details about the workflow.

Usage

msmsRead(w, filetable = NULL, files = NULL, cpdids = NULL, readMethod, mode, confirmMode = FALSE, useRtLimit = TRUE, Args = NULL, settings = getOption("RMassBank"), progressBar = "progressBarHook", MSe = FALSE, plots = FALSE)

Arguments

w
A msmsWorkspace to work with.

filetable
The path to a .csv-file that contains the columns "Files" and "ID" supplying the relationships between files and compound IDs. Either this or the parameter "files" need to be specified.

files
A vector or list containing the filenames of the files that are to be read as spectra. For the IDs to be inferred from the filenames alone, there need to be exactly 2 underscores.

cpdids
A vector or list containing the compound IDs of the files that are to be read as spectra. The ordering of this and files implicitly assigns each ID to the corresponding file. If this is supplied, then the IDs implicitly named in the filenames are ignored.

readMethod
Several methods are available to get peak lists from the files. Currently supported are "mzR", "xcms", "MassBank" and "peaklist". The first two read MS/MS raw data, and differ in the strategy used to extract peaks. MassBank will read existing records, so that e.g. a recalibration can be performed, and "peaklist" just requires a CSV with two columns and the column header "mz", "int".

mode

confirmMode
Defaults to false (use most intense precursor). Value 1 uses the 2nd-most intense precursor for a chosen ion (and its data-dependent scans), etc.

useRtLimit
Whether to enforce the given retention time window.

Args
A list of arguments that will be handed to the xcms-method findPeaks via do.call

settings
Options to be used for processing. Defaults to the options loaded via loadRmbSettings et al. Refer to there for specific settings.

progressBar
The progress bar callback to use. Only needed for specialized applications. Cf. the documentation of progressBarHook for usage.

MSe
A boolean value that determines whether the spectra were recorded using MSe or not

plots
A boolean value that determines whether the pseudospectra in XCMS should be plotted
Value

The msmsWorkspace with msms-spectra read.

Author(s)

Michael Stravs, Eawag <michael.stravs@eawag.ch>
Erik Mueller, UFZ

See Also

msmsWorkspace-class, msmsWorkflow

Description

The filenames of the raw LC-MS runs are read from the array files in the global enviroment. See the vignette vignette("RMassBank") for further details about the workflow.

Usage

msmsRead.RAW(w, xRAW = NULL, cpdids = NULL, mode, findPeaksArgs = NULL, settings = getOption("RMassBank"), progressbar = "progressBarHook", plots = FALSE)

Arguments

w
A msmsWorkspace to work with.

xRAW
A list of xcmsRaw objects whose peaks should be detected and added to the workspace. The relevant data must be in the MS1 data of the xcmsRaw object. You can coerce the msn-data in a usable object with the msn2xcmsRaw function of xcms.

cpdids
A vector or list containing the compound IDs of the files that are to be read as spectra. The ordering of this and files implicitly assigns each ID to the corresponding file. If this is supplied, then the IDs implicitly named in the filenames are ignored.

mode

findPeaksArgs
A list of arguments that will be handed to the xcms-method findPeaks via do.call

settings
Options to be used for processing. Defaults to the options loaded via loadRmbSettings et al. Refer to there for specific settings.

progressbar
The progress bar callback to use. Only needed for specialized applications. Cf. the documentation of progressBarHook for usage.

plots
A boolean value that determines whether the pseudospectra in XCMS should be plotted

**msmsWorkflow**

*RMassBank mass spectrometry pipeline*

**Description**

Extracts and processes spectra from a specified file list, according to loaded options and given parameters.

**Usage**

```r
msmsWorkflow(w, mode = "pH", steps = c(1:8), confirmMode = FALSE,
newRecalibration = TRUE, useRtlLimit = TRUE, archivename = NA,
readMethod = "mzR", findPeaksArgs = NULL, plots = FALSE,
precursorscan.cf = FALSE, settings = getOption("RMassBank"),
analyzeMethod = "formula", progressbar = "progressBarHook", MSe = FALSE)
```

**Arguments**

`w`  
A msmsWorkspace to work with.

`mode`  

`steps`  
Which steps of the workflow to process. See the vignette vignette("RMassBank") for details.

`confirmMode`  
Defaults to false (use most intense precursor). Value 1 uses the 2nd-most intense precursor for a chosen ion (and its data-dependent scans), etc.

`newRecalibration`  
Whether to generate a new recalibration curve (TRUE, default) or to reuse the currently stored curve (FALSE, useful e.g. for adduct-processing runs.)

`useRtlLimit`  
Whether to enforce the given retention time window.

`archivename`  
The prefix under which to store the analyzed result files.

`readMethod`  
Several methods are available to get peak lists from the files. Currently supported are "mzR", "xcms", "MassBank" and "peaklist". The first two read MS/MS raw data, and differ in the strategy used to extract peaks. MassBank will read existing records, so that e.g. a recalibration can be performed, and "peaklist" just requires a CSV with two columns and the column header "mz", "int".
**msmsWorkspace-class**

**findPeaksArgs**
A list of arguments that will be handed to the xcms-method findPeaks via do.call.

**plots**
A parameter that determines whether the spectra should be plotted or not (This parameter is only used for the xcms-method).

**precursorscan.cf**
Whether to fill precursor scans. To be used with files which for some reasons do not contain precursor scan IDs in the mzML, e.g. AB Sciex converted files.

**settings**
Options to be used for processing. Defaults to the options loaded via `loadRmbSettings` et al. Refer to there for specific settings.

**analyzeMethod**
The "method" parameter to pass to `analyzeMsMs`.

**progressbar**
The progress bar callback to use. Only needed for specialized applications. Cf. the documentation of `progressBarHook` for usage.

**MSe**
A boolean value that determines whether the spectra were recorded using MSe or not

**Details**
The filenames of the raw LC-MS runs are read from the array `files` in the global enironment. See the vignette `vignette("RMassBank")` for further details about the workflow.

**Value**
The processed `msmsWorkspace`.

`msmsWorkspace-class`

---

**msmsWorkspace-class**

**Workspace for msmsWorkflow data**

**Description**
A workspace which stores input and output data for `msmsWorkflow`.

**Usage**

```r
## S4 method for signature 'msmsWorkspace'
show(object)
```

**Arguments**

- `object` The `msmsWorkspace` to display.
newMbWorkspace

Details

Slots:

files The input file names
spectra The spectra per compound (RmbSpectraSet) extracted from the raw files
aggregated A data.frame with an aggregated peak table from all spectra. Further columns are added during processing.
rc, rc.ms1 The recalibration curves generated in workflow step 4.
parent For the workflow steps after 4: the parent workspace containing the state (spectra, aggregate) before recalibration, such that the workflow can be reprocessed from start.
archivename The base name of the files the archive is stored to during the workflow.
settings The RMassBank settings used during the workflow, if stored with the workspace.

Methods:

show Shows a brief summary of the object and processing progress.

Author(s)

Michael Stravs, Eawag <michael.stravs@eawag.ch>

msmsWorkflow

newMbWorkspace

Create new workspace for mbWorkflow

Description

Creates a new workspace for use with mbWorkflow.

Usage

newMbWorkspace(w)

Arguments

w The input msmsWorkspace to load input data from.

Details

The workspace input data will be loaded from the msmsWorkspace-class object provided by the parameter w.

Value

A new mbWorkflow object with the loaded input data.
newMsmsWorkspace

Description

Creates an empty workspace or loads an existing workspace from disk.

Usage

newMsmsWorkspace(files = character(0))

Arguments

files If given, the files list to initialize the workspace with.

Details

newMsmsWorkspace creates a new empty workspace for use with msmsWorkflow.
loadMsmsWorkspace loads a workspace saved using archiveResults. Note that it also successfully loads data saved with the old RMassBank data format into the new msmsWorkspace object.

Value

A new msmsWorkspace object

Author(s)

Michael Stravs, Eawag <michael.stravs@eawag.ch>

See Also

msmsWorkflow, msmsWorkspace-class
order.formula  
Order a chemical formula correctly

Description
Orders a chemical formula in the commonly accepted order (CH followed by alphabetic ordering).

Usage
order.formula(formula, as.formula = TRUE, as.list = FALSE)

Arguments
formula  A molecular formula in string or list representation ("C6H6" or list(C=6,H=6)).
as.formula  If TRUE, the return value is returned as a string. This is the default.
as.list  If TRUE, the return value is returned in list representation.

Author(s)
Michele Stravs

See Also
list.to.formula, add.formula, is.valid.formula

Examples
#
order.formula("H4C9")
order.formula("C2N5HClBr")

parseMassBank  
MassBank-record Parser

Description
Can parse MassBank-records(only V2)

Usage
parseMassBank(Files)

Arguments
Files  A path to the plaintext-record that should be read

Value
The mbWorkspace that the plaintext-record creates.
peaksMatched

Author(s)
Erik Mueller

See Also
validate

Examples

## Not run:
parseMassBank("filepath_to_records/RC00001.txt")

## End(Not run)

peaksMatched Select matching/unmatching peaks from aggregate table

Description
Select matching/unmatching peaks from aggregate table

Usage
peaksMatched(o)

## S4 method for signature 'data.frame'
peaksMatched(o)

## S4 method for signature 'msmsWorkspace'
peaksMatched(o)

Arguments

o Workspace or aggregate table from a workspace

Value
Selects the peaks from the aggregate table which matched within filter criteria (peaksMatched) or didn’t match (peaksUnmatched).

Methods (by class)

- data.frame: A method to retrieve the matched peaks from the "aggregated" slot (a data.frame object) in an msmsWorkSpace
- msmsWorkspace: A method to retrieve the matched peaks from an msmsWorkSpace

Author(s)
stravsmi
peaksUnmatched

Select matching/unmatching peaks from aggregate table

Description
Select matching/unmatching peaks from aggregate table

Usage
peaksUnmatched(o, cleaned = FALSE)

## S4 method for signature 'data.frame'
peaksUnmatched(o, cleaned = FALSE)

## S4 method for signature 'msmsWorkspace'
peaksUnmatched(o, cleaned = FALSE)

Arguments
- `o` Workspace or aggregate table from a workspace
- `cleaned` Return only peaks which pass electronic noise filtering if TRUE.

Value
Selects the peaks from the aggregate table which matched within filter criteria (peaksMatched) or didn’t match (peaksUnmatched).

Methods (by class)
- `data.frame`: A method to retrieve the unmatched peaks from the "aggregated" slot (a data.frame object) in an msmsWorkSpace
- `msmsWorkspace`: A method to retrieve the unmatched peaks from an msmsWorkSpace

Author(s)
stravsmi

plotMbWorkspaces
Plots mbWorkspaces

Description
Plots the peaks of one or two mbWorkspace to compare them.

Usage
plotMbWorkspaces(w1, w2 = NULL)
Arguments

- `w1`: The `mbWorkspace` to be plotted
- `w2`: Another optional `mbWorkspace` be plotted as a reference.

Details

This function plots one or two `mbWorkspaces` in case the user has used different methods to acquire similar spectra. `w1` must always be supplied, while `w2` is optional. The workspaces need to be fully processed for this function to work.

Value

A logical indicating whether the information was plotted or not

Author(s)

Erik Mueller

Examples

```r
# Not run: plotMbWorkspaces(w1,w2)
```

plotRecalibration

Plot the recalibration graph.

Description

Plot the recalibration graph.

Usage

```r
plotRecalibration(w, recalibrateBy = getOption("RMassBank")$recalibrateBy)
plotRecalibration.direct(rcdata, rc, rc.ms1, title, mzrange,
recalibrateBy = getOption("RMassBank")$recalibrateBy)
```

Arguments

- `w`: The workspace to plot the calibration graph from
- `recalibrateBy`: Whether recalibration was done by ppm ("ppm") or by m/z ("mz"). Important only for graph labeling here.
- `rcdata`: A data frame with columns `recalfield` and `mzFound`.
- `rc`: Predictor for MS2 data
- `rc.ms1`: Predictor for MS1 data
- `title`: Prefix for the graph titles
- `mzrange`: m/z value range for the graph
**Description**

Calculates ppm values for a given mass.

**Usage**

```r
ppm(mass, dppm, l = FALSE, p = FALSE)
```

**Arguments**

- `mass`: The "real" mass
- `dppm`: The mass deviation to calculate
- `l`: Boolean: return limits? Defaults to FALSE.
- `p`: Boolean: return ppm error itself? Defaults to FALSE.

**Details**

This is a helper function used in RMassBank code.

**Value**

By default (l=FALSE, p=FALSE) the function returns the mass plus the ppm error (for 123.00000 and 10 ppm: 123.00123, or for 123 and -10 ppm: 122.99877).

For l=TRUE, the function returns the upper and lower limit (sic!) For p=TRUE, just the difference itself is returned (0.00123 for 123/10ppm).

**Author(s)**

Michael A. Stravs, Eawag <michael.stravs@eawag.ch>

**Examples**

```r
ppm(100, 10)
```
**problematicPeaks**

*Identify intense peaks (in a list of unmatched peaks)*

**Description**

Finds a list of peaks in spectra with a high relative intensity (>10 \(10^4\), or >1 checked. Peaks orbiting around the parent peak mass (calculated from the compound ID), which are very likely co-isolated substances, are ignored.

**Usage**

```r
problematicPeaks(peaks_unmatched, peaks_matched, mode = "pH")
```

**Arguments**

- `peaks_unmatched`: Table of unmatched peaks, with at least `cpdID`, `scan`, `mzFound`, `int`
- `peaks_matched`: Table of matched peaks (used for base peak reference), with at least `cpdID`, `scan`, `int`
- `mode`: Processing mode ("pH", "pNa" etc.)

**Value**

A filtered table with the potentially problematic peaks, including the precursor mass and MSMS base peak intensity (`aMax`) for reference.

**Author(s)**

Michael Stravs

**See Also**

`msmsWorkflow`

**Examples**

```r
## Not run:
# As used in the workflow:
fp <- problematicPeaks(specs[!specs$filterOK & !specs$noise & ((specs$dppm == specs$dppmBest) | (is.na(specs$dppmBest))) ,,,drop=FALSE], peaksMatched(w), mode)
## End(Not run)
```
processProblematicPeaks

Generate list of problematic peaks

Description

Generates a list of intense unmatched peaks for further review (the "failpeak list") and exports it if
the archive name is given.

Usage

processProblematicPeaks(w, mode, archivename = NA)

Arguments

w           msmsWorkspace to analyze.
mode        Processing mode (pH etc)
archivename Base name of the archive to write to (for "abc" the exported failpeaks list will
             be "abc_Failpeaks.csv"). if the compoundlist is complete, "tentative", if at least
             a formula is present or "unknown" if the only know thing is the m/z

Value

Returns the aggregate data.frame with added column "problematic" (logical) which marks peaks
which match the problematic criteria

Author(s)

stravsni

progressBarHook

Standard progress bar hook.

Description

This function provides a standard implementation for the progress bar in RMassBank.

Usage

progressBarHook(object = NULL, value = 0, min = 0, max = 100,
close = FALSE)

Arguments

object An identifier representing an instance of a progress bar.
value The new value to assign to the progress indicator
min The minimal value of the progress indicator
max The maximal value of the progress indicator
close If TRUE, the progress bar is closed.
reanalyzeFailpeaks

Details

RMassBank calls the progress bar function in the following three ways: pb <- progressBarHook(object=NULL, value=0, min=0, max=LEN) to create a new progress bar. pb <- progressBarHook(object=pb, value=VAL) to set the progress bar to a new value (between the set min and max). progressBarHook(object=pb, close=TRUE) to close the progress bar. (The actual calls are performed with do.call, e.g. progressBar <- "progressBarHook" pb <- do.call(progressBar, list(object=pb, value=nProg)). See the source code for details.)

To substitute the standard progress bar for an alternative implementation (e.g. for use in a GUI), the developer can write his own function which behaves in the same way as progressBarHook, i.e. takes the same parameters and can be called in the same way.

Value

Returns a progress bar instance identifier (i.e. an identifier which can be used as object in subsequent calls.)

Author(s)

Michele Strav, Eawag <stravmi@eawag.ch>

Description

Reanalysis of peaks with no matching molecular formula by allowing additional elements (e.g. "N2O").

Usage

reanalyzeFailpeaks(aggregated, custom_additions, mode, filterSettings = getOption("RMassBank")$filterSettings, progressbar = "progressBarHook")
reanalyzeFailpeak(custom_additions, mass, cpdID, counter, pb = NULL, mode, filterSettings = getOption("RMassBank")$filterSettings)

Arguments

aggregated A peake aggregate table (w@aggregate) (after processing electronic noise removal!)
custom_additions The allowed additions, e.g. "N2O".
mode Processing mode ("pH", "pNa", "mH" etc.)
filterSettings Settings for filtering data. Refer to analyzeMsMs for settings.
progressbar The progress bar callback to use. Only needed for specialized applications. Cf. the documentation of progressBarHook for usage.
mass (Usually recalibrated) m/z value of the peak.
cpdID Compound ID of this spectrum.
counter Current peak index (used exclusively for the progress indicator)
pb A progressbar object to display progress on, as passed by reanalyzeFailpeaks to reanalyzeFailpeak. No progress is displayed if NULL.
**Details**

`reanalyzeFailpeaks` examines the `unmatchedPeaksC` table in `specs` and sends every peak through `reanalyzeFailpeak`.

**Value**

The aggregate data frame extended by the columns: `#' reanalyzed.???

If reanalysis (step 7) has already been processed: matching values from the reanalyzed peaks

`matchedReanalysis` Whether reanalysis has matched (TRUE), not matched (FALSE) or has not been conducted for the peak (NA).

It would be good to merge the analysis functions of `analyzeMsMs` with the one used here, to simplify code changes.

**Author(s)**

Michael Stravs

**See Also**

`analyzeMsMs`, `msmsWorkflow`

**Examples**

```r
## As used in the workflow:
## Not run:
reanalyzedRcSpecs <- reanalyzeFailpeaks(w@aggregated, custom_additions="N2O", mode="pH")
# A single peak:
reanalyzeFailpeak("N2O", 105.0447, 1234, 1, 1, "pH")
## End(Not run)
```

---

**recalibrate**

*Predefined recalibration functions.*

**Description**

Predefined fits to use for recalibration: Loess fit and GAM fit.

**Usage**

- `recalibrate.loess(rcdata)`
- `recalibrate.identity(rcdata)`
- `recalibrate.mean(rcdata)`
- `recalibrate.linear(rcdata)`
Arguments
rcdata  A data frame with at least the columns recalfield and mzFound. recalfield
will usually contain delta(ppm) or delta(mz) values and is the target parameter
for the recalibration.

Details
recalibrate.loess() provides a Loess fit (recalibrate.loess) to a given recalibration param-
erter. If MS and MS/MS data should be fit together, recalibrate.loess provides good default settings
for Orbitrap instruments.
recalibrate.identity() returns a non-recalibration, i.e. a predictor which predicts 0 for all input
values. This can be used if the user wants to skip recalibration in the RMassBank workflow.
#’ recalibrate.mean() and recalibrate.linear() are simple recalibrations which return a
constant shift or a linear recalibration. They will be only useful in particular cases.
recalibrate() itself is only a dummy function and does not do anything.
Alternatively other functions can be defined. Which functions are used for recalibration is speci-
fied by the RMassBank options file. (Note: if recalibrateMS1: common, the recalibrator: MS1
value is irrelevant, since for a common curve generated with the function specified in recalibrator: MS2
will be used.)

Value
Returns a model for recalibration to be used with predict and the like.

Author(s)
Michael Stravs, EAWAG <michael.stravs@eawag.ch>

Examples
## Not run:
rcdata <- subset(spec$peaksMatched, formulaCount==1)
ms1data <- recalibrate.addMS1data(spec, mode, 15)
rcdata <- rbind(rcdata, ms1data)
rcdata$recalfield <- rcdata$dppm
rcCurve <- recalibrate.loess(rcdata)
# define a spectrum and recalibrate it
s <- matrix(c(100,150,200,88.8887,95.0005,222.2223), ncol=2)
colnames(s) <- c("mz", "int")
recalS <- recalibrateSingleSpec(s, rcCurve)

Alternative: define an custom recalibrator function with different parameters
recalibrate.MyOwnLoess <- function(rcdata)
{
  return(loess(recalfield ~ mzFound, data=rcdata, family=c("symmetric"),
              degree = 2, span=0.4))
}
# This can then be specified in the RMassBank settings file:
# recalibrateMS1: common
# recalibrator:
#   MS1: recalibrate.loess
#   MS2: recalibrate.MyOwnLoess"
# [...]
### Description

Returns the precursor peaks for all MS1 spectra in the `spec` dataset with annotated formula to be used in recalibration. For all spectra in `spec$specFound`, the precursor ion is extracted from the MS1 precursor spectrum. All found ions are returned in a data frame with a format matching `spec$peaksMatched` and therefore suitable for `rbind`ing to the `spec$peaksMatched` table. However, only minimal information needed for recalibration is returned.

### Usage

```r
data <- recalibrate.addMS1data(spec, mode="pH", recalibrateMS1Window = getOption("RMassBank")$recalibrateMS1Window)
```

### Arguments

- **spec**: A `msmsWorkspace` or `RmbSpectraSetList` containing spectra for which MS1 "peaks" should be "constructed".
- **recalibrateMS1Window**: Window width to look for MS1 peaks to recalibrate (in ppm).

### Value

A dataframe with columns `mzFound`, `formula`, `mzCalc`, `dppm`, `dbe`, `int`, `dppmBest`, `formulaCount`, `good`, `cpdID`, `scan`, `parentScan`, `dppmRc`.

However, columns `dbe`, `int`, `formulaCount`, `good`, `scan`, `parentScan` do not contain real information and are provided only as fillers.

### Author(s)

Michael Stravs, EAW AG <michael.stravs@eawag.ch>

### Examples

```r
## Not run:
# More or less as used in recalibrateSpectra:
data <- peaksMatched(w)
data <- data[data$formulaCount == 1L, , drop=FALSE]
ms1data <- recalibrate.addMS1data(w, "pH", 15)
data <- rbind(data, ms1data)
# ... continue constructing recalibration curve with data

## End(Not run)
```
Description

Load, set and reset settings for RMassBank.

Usage

loadRmbSettings(file_or_list)
loadRmbSettingsFromEnv(env = .GlobalEnv)
RmbDefaultSettings()
RmbSettingsTemplate(target)

Arguments

file_or_list The file (YML or R format) or R list with the settings to load.
target The path where the template setting file should be stored.
env The environment to load the settings from.

Details

RmbSettingsTemplate creates a template file in which you can adjust the settings as you like. Before using RMassBank, you must then load the settings file using loadRmbSettings. RmbDefaultSettings loads the default settings. loadRmbSettingsFromEnv loads the settings stored in env$RmbSettings, which is useful when reloading archives with saved settings inside.

Note: no settings are loaded upon loading MassBank! This is intended, so that one never forgets to load the correct settings.

The settings are described in RmbSettings.

Value

None.

Note

The default settings will not work for you unless you have, by chance, installed OpenBabel into the same directory as I have!

Author(s)

Michael Stravs

See Also

RmbSettings
Examples

# Create a standard settings file and load it (unedited)
RmbSettingsTemplate("mysettings.ini")
loadRmbSettings("mysettings.ini")
unlink("mysettings.ini")

<table>
<thead>
<tr>
<th>RmbSettings</th>
<th>RMassBank settings</th>
</tr>
</thead>
</table>

Description

Describes all settings for the RMassBank settings file.

Details

- deprofile Whether and how to deprofile input raw files. Leave the setting empty if your raw files are already in "centroid" mode. If your input files are in profile mode, you have the choice between algorithms deprofile.spline, deprofile.fwhm, deprofile.localMax; refer to the individual manpages for more information.
- rtMargin, rtShift The allowed retention time deviation relative to the values specified in your compound list (see loadList), and the systematic shift (due to the use of, e.g., precolumns or other special equipment.
- babeldir Directory to OpenBabel. Required for creating molfiles for MassBank export. If no OpenBabel directory is given, RMassBank will attempt to use the CACTUS webservice for SDF generation. It is strongly advised to install OpenBabel; the CACTUS structures have explicit hydrogen atoms. The path should point to the directory where babel.exe (or the Linux "babel" equivalent) lies.
- use_version Which MassBank record format to use; version 2 is strongly advised, version 1 is considered outdated and should be used only if for some reason you are running old servers and an upgrade is not feasible.
- use_rean_peaks Whether to include peaks from reanalysis (see reanalyzeFailpeaks) in the MassBank records. Boolean, TRUE or FALSE.
- annotations A list of constant annotations to use in the MassBank records. The entries authors, copyright, license, instrument, instrument_type, compound_class correspond to the MassBank entries AUTHORS, COPYRIGHT, PUBLICATION, LICENSE, AC$INSTRUMENT, AC$INSTRUMENT_TYPE, CH$COMPOUND_CLASS. The entry confidence_comment is added as COMMENT: CONFIDENCE entry.

The entry internal_id_fieldname is used to name the MassBank entry which will keep a reference to the internal compound ID used in the workflow: for internal_id_fieldname = MYID and e.g. compound 1234, an entry will be added to the MassBank record with COMMENT: MYID 1234. The internal fieldname should not be left empty!

The entries lc_gradient, lc_flow, lc_solvent_a, lc_solvent_b, lc_column correspond to the MassBank entries AC$CHROMATOGRAPHY: FLOW_GRADIENT, FLOW_RATE, SOLVENT A, SOLVENT B, COLUMN_NAME. ms_type, ionization correspond to AC$MASS_SPECTROMETRY: MS_TYPE, IONIZATION. entry_prefix is the two-letter prefix used when building MassBank accession codes.

Entries under ms_dataprocessing are added as MS$DATA_PROCESSING: entries, in addition to the default WHOLE: RMassBank.
• annotator For advanced users: option to select your own custom annotator. Check `annotator.default` and the source code for details.

• spectraList This setting describes the experimental annotations for the single data-dependent scans. For every data-dependent scan event, a `spectraList` entry with `mode, ces, ce, res` denoting collision mode, collision energy in short and verbose notation, and FT resolution.

• accessionNumberShifts This denotes the starting points for accession numbers for different ion types. For example, `pH: 0, mH: 50` means that `[M+H]⁺` spectra will start at XX123401 (XX being the entry_prefix and 1234 the compound id) and `[M-H]⁻` will start at XX123451.

• electronicNoise, electronicNoiseWidth Known electronic noise peaks and the window to be used by `cleanElnoise`

• recalibrateBy dpmp or dmz to recalibrate either by delta ppm or by delta mz.

• recalibrateMS1 common or separate to recalibrate MS1 data points together or separately from MS2 data points.

• recalibrator: MS1, MS2 The functions to use for recalibration of MS1 and MS2 data points. Note that the MS1 setting is only meaningful if `recalibrateMS1: separate`, otherwise the MS2 setting is used for a common recalibration curve. See `recalibrate.loess` for details.

• multiplicityFilter Define the multiplicity filtering level. Default is 2, a value of 1 is off (no filtering) and >2 is harsher filtering.

• titleFormat The title of MassBank records is a mini-summary of the record, for example "Dinofuran; LC-ESI-QFT, MS2; CE: 35 By default, the first compound name CH$NAME$, instrument type AC$INSTRUMENT_TYPE$, MS/MS type AC$MASS_SPECTROMETRY: MS_TYPE$, collision energy RECORD_TITLE_CE, resolution AC$MASS_SPECTROMETRY: RESOLUTION$ and precursor MS$FOCUSED_ION: PRECURSOR_TYPE$ are used. If alternative information is relevant to differentiate acquired spectra, the title should be adjusted. For example, many TOFs do not have a resolution setting. See MassBank documentation for more.

• filterSettings A list of settings that affect the MS/MS processing. The entries `ppmHighMass, ppmLowMass, massRangeDivision` set values for pre-processing, prior to recalibration. `ppmHighMass` defines the ppm error for the high mass range (default 10 ppm for Orbitraps), `ppmLowMass` is the error for the low mass range (default 15 ppm for Orbitraps) and `massRangeDivision` is the m/z value defining the split between the high and low mass range (default m/z = 120).

• preliminaryCut, preliminaryCutRatio define the intensity cut-off and cut-off ratio (in the peak selection for the recalibration only. Careful: the default value 1e4 for Orbitrap LTQ positive mode could remove all peaks for TOF data and will remove too many peaks for Orbitrap LTQ negative mode spectra!

• specOKLimit defines the intensity limit to include MS/MS spectra. MS/MS spectra must have at least one peak above this limit to proceed through the workflow.

• dbeMinLimit defines the minimum allowable ring and double bond equivalents (DBE) allowed for assigned formulas. This assumes maximum valences for elements with multiple valence states. The default is -0.5 (accounting for fragments being ions).

• satelliteMzLimit, satelliteIntLimit define the cut-off m/z and intensity values for satellite peak removal (an artefact of Fourier Transform processing). All peaks within the m/z limit (default 0.5) and intensity ratio (default 0.05 or 5 Fourier Transform instruments only (e.g. Orbitrap).

• filterSettings Parameters for adjusting the raw data retrieval. The entry `ppmFine` defines the ppm error to look for the precursor in the MS1 (parent) spectrum. Default is 10 ppm for Orbitrap.
mzCoarse defines the error to search for the precursor specification in the MS2 spectrum. This is often only saved to 2 decimal places and thus can be quite inaccurate. The accuracy also depends on the isolation window used. The default settings (for e.g. Orbitrap) is 0.5 (Da, or Th for m/z).

The entry fillPrecursorScan is largely untested. The default value (FALSE) assumes all necessary precursor information is available in the mzML file. A setting of TRUE tries to fill in the precursor data scan number if it is missing. Only tested on one case study so far - feedback welcome!

loadRmbSettings

**selectPeaks**

`Select peaks from aggregate table`

**Description**

Selects peaks from aggregate table according to different criteria.

**Usage**

```r
selectPeaks(o, ...)
```

```r
## S4 method for signature 'data.frame'
selectPeaks(o, good = FALSE, bad = FALSE, cleaned = FALSE, best = FALSE)
```

```r
## S4 method for signature 'msmsWorkspace'
selectPeaks(o, ...)
```

**Arguments**

- `o` msmsWorkspace or aggregate data.frame from a workspace.
- `...` no additional parameters
- `good` if TRUE, include good (matched within filter criteria) peaks.
- `bad` if TRUE, include bad (not matched within filter criteria) peaks. Note: good and bad can be combined, both are returned in that case.
- `cleaned` if TRUE, return only peaks which passed the noise filter. Note: If the noise filter was not applied, the parameter has no effect. Also, a noise column is in any case added to the output, even if not present before.
- `best` if TRUE, only select the best match for each peak (i.e. the formula with smallest delta ppm). Otherwise multiple matches can be returned.

**Value**

Peak dataframe according to the specified criteria.
selectSpectra

Methods (by class)

- `data.frame`: A method to retrieve the specified peaks from the "aggregated" slot (a data.frame object) in an msmsWorkspace
- `msmsWorkspace`: A method to retrieve the specified peaks from an msmsWorkspace

Author(s)

stravsmi

---

selectSpectra  
**Select a subset of spectra matching properties**

Description

From a list of RmbSpectraSets, returns the spectra which match a criterion (found, complete, empty as in checkSpectra). This can be returned either as a TRUE/FALSE vector, as a vector of indices for matching elements, as a vector of RmbSpectraSet objects matching the conditions, or as a vector of RmbSpectraSet objects NOT matching the conditions (sic!).

Usage

```r
selectSpectra(s, property, value = "logical")
## S4 method for signature 'RmbSpectraSetList,character'
selectSpectra(s, property, value = "logical")
## S4 method for signature 'msmsWorkspace,character'
selectSpectra(s, property, value = "logical")
```

Arguments

- `s`  
The RmbSpectraSetList or msmsWorkspace to select RmbSpectraSets from.
- `property`  
The property to check (found, complete or empty)
- `value`  
logical if a TRUE/FALSE list should be returned; index if a vector of matching indices should be returned, object if matching objects should be returned, mismatch if mismatching objects should be returned.

Value

As described above.

Methods (by class)

- `s = RmbSpectraSetList,property = character`: A method for selecting spectra from a spectra set list
- `s = msmsWorkspace,property = character`: A method for selecting spectra from an msmsWorkspace
**setData**

**Author(s)**
stravsmi

**Description**
Sets all slots which are present as columns in the given dataframe. Optionally cleans the object, i.e. empties slots not defined in the data frame.

**Usage**
```r
## S4 method for signature 'RmbSpectrum2,data.frame'
setData(s, df, clean = TRUE)
```

**Arguments**
- `s`: The `RmbSpectrum2` object to modify
- `df`: The data frame with new data
- `clean`: TRUE if slots which aren’t present as columns in the data frame should be cleared.

**Value**
The modified `RmbSpectrum2`.

**Author(s)**
stravsmi

---

**smiles2mass**

*Calculate the mass from a SMILES-String*

**Description**
Uses a SMILES-String to calculate the mass using rcdk-integrated functions.

**Usage**
```r
smiles2mass(SMILES)
```

**Arguments**
- `SMILES`: A String-object representing a SMILES

**Value**
The calculated mass of the given SMILES-Formula
spectraCount

Author(s)
Erik Mueller

Examples

```r
## Not run:
smiles2mass("CC(=O)NC(C(O)1)C(O)C(OC(O2)C(O)C(OC(O3)C(O)C(O)C(C(O)C(CO)2)C(CO)O1")
## End(Not run)
```

---

**spectraCount**

*Count MS2 spectra per compound*

Description

Counts the number of acquired spectra for a compound or multiple compounds

Usage

```r
spectraCount(s)
```

## S4 method for signature 'RmbSpectraSet'

```r
spectraCount(s)
```

## S4 method for signature 'RmbSpectraSetList'

```r
spectraCount(s)
```

## S4 method for signature 'msmsWorkspace'

```r
spectraCount(s)
```

Arguments

- **s**
  The object (RmbSpectraSet, RmbSpectraSetList or msmsWorkspace) to count the spectra in.

Value

For `RmbSpectraSet` objects, a single number counting the spectra in that object. For `RmbSpectraSetList` or `msmsWorkspace`, a vector with spectra counts for all compounds (`RmbSpectraSets`) in the object.

Methods (by class)

- `RmbSpectraSet`: Counts the number of acquired spectra for an `RmbSpectraSet`
- `RmbSpectraSetList`: Counts the number of acquired spectra for an `RmbSpectraSetList`
- `msmsWorkspace`: Counts the number of acquired spectra for an `msmsWorkspace`

to.limits.rcdk  

Convert formula to Rcdk limits

Description

Converts a molecular formula e.g. C15H20 into an upper limit appropriate for use with Rcdk’s generate.formula function’s element argument.

Usage

to.limits.rcdk(formula)

Arguments

formula A molecular formula in string or list representation ("C6H6" or list(C=6,H=6)).

Details

This helper function is used to make the upper limits for generate.formula when finding subformulas to match to a MS2 fragment peak.

Value

An array in the form c( c("C", "0", "12"), c("H", "0", "12")) (for input of "C12H12").

Author(s)

Michael Stravs

See Also

generate.formula, add.formula

Examples

```r
# to.limits.rcdk("C6H6")
to.limits.rcdk(add.formula("C6H12O6", "H"))
```
toMassbank  

Write MassBank record into character array

Description

Writes a MassBank record in list format to a text array.

Usage

toMassbank(mbdata)

Arguments

mbdata  
A MassBank record in list format.

Details

The function is a general conversion tool for the MassBank format; i.e. the field names are not fixed. mbdata must be a named list, and the entries can be as follows:

- A single text line:
  
  'CH$EXACT_MASS' = '329.1023'

  is written as
  
  CH$EXACT_MASS: 329.1023

- A character array:
  
  'CH$NAME' = c('2-Aminobenzimidazole', '1H-Benzimidazol-2-amine')

  is written as
  
  CH$NAME: 2-Aminobenzimidazole
  CH$NAME: 1H-Benzimidazol-2-amine

- A named list of strings:
  
  'CH$LINK' = list('CHEBI' = "27822", "KEGG" = "C10901")

  is written as
  
  CH$LINK: CHEBI 27822
  CH$LINK: KEGG C10901

- A data frame (e.g. the peak table) is written as specified in the MassBank record format (Section 2.6.3): the column names are used as headers for the first line, all data rows are printed space-separated.

Value

The result is a text array, which is ready to be written to the disk as a file.

Note

The function iterates over the list item names. **This means that duplicate entries in mbdata are (partially) discarded!** The correct way to add them is by making a character array (as specified above): Instead of 'CH$NAME' = 'bla', 'CH$NAME' = 'blub' specify 'CH$NAME' = c('bla', 'blub').
## toRMB

### Conversion of XCMS-pseudospectra into RMassBank-spectra

#### Description

Converts a pseudospectrum extracted from XCMS using CAMERA into the `msmsWorkspace` spectrum-format that RMassBank uses.

#### Usage

```r
toRMB(msmsXCMSspecs, cpdID, mode, MS1spec)
```

#### Arguments

- `msmsXCMSspecs`: The compoundID of the compound that has been used for the peaklist
- `cpdID`: The compound ID of the substance of the given spectrum
- `mode`: The ionization mode that has been used for the spectrum
- `MS1spec`: The MS1-spectrum from XCMS, which can be optionally supplied

#### Value

One list element of the (at)specs-entry from an `msmsWorkspace`

#### Author(s)

Erik Mueller
updateSettings

Update settings to current version

Description

Checks if all necessary fields are present in the current settings and fills in default values from the R_mbDefaultSettings if required.

Usage

updateSettings(settings, warn = TRUE)

Arguments

settings  The set of settings to check and update.

warn  Whether to update parameters quietly (FALSE) or to notify the user of the changed parameters (TRUE, default.) This serves to make the user aware that standard parameters are filled in!

Value

The updated set of settings.

Note

Important: There is a change in behaviour of RMassBank in certain cases when filterSettings is not present in the old settings! The default pre-recalibration cutoff from R_mbDefaultSettings is 10000. Formerly the pre-recalibration cutoff was set to be 10000 for positive spectra but 0 for negative spectra.

Updating the settings files is preferred to using the updateSettings function.

Author(s)

Stravs MA, Eawag <michael.stravs@eawag.ch>

Examples

## Not run:
w@settings <- updateSettings(w@settings)

## End(Not run)
validate

Validate MassBank records with a set of Unit tests

Description

Validates a plain text MassBank record, or recursively all records within a directory. The Unit Tests to be used are installed in RMassBank/inst/validationTests and currently include checks for NAs, peaks versus precursor, precursor mz, precursor type, SMILES vs exact mass, total intensities and title versus type. The validation report is saved as "report.html" in the working directory.

Usage

validate(path, simple = TRUE)

Arguments

path The filepath to a single record, or a directory to search recursively
simple If TRUE the function creates a simpler form of the RUnit .html report, better readable for humans. If FALSE it returns the unchanged RUnit report.

Examples

## Not run:
validate("/tmp/MassBank/OpenData/record/")

## End(Not run)
