Description

various functionals of ROC (Receiver Operating Characteristic) curves

Usage

AUC(rocobj)
AUCi(rocobj)
pAUC(rocobj,t0)
pAUCi(rocobj,t0)
Arguments

rocobj    element of class rocc

t0        FPR point at which TPR is evaluated or limit in (0,1) to integrate to

Details

AUC, pAUC, AUCi and pAUCi compute the Area Under the Curve.
AUC and pAUC employ the trapezoidal rule. AUCi and pAUCi use integrate().
AUC and AUCi compute the area under the curve from 0 to 1 on the x-axis (i.e., the 1 - specificity axis).
pAUC and pAUCi compute the area under the curve from 0 to argument t0 on the x-axis (i.e., the 1 - specificity axis).
Elements of class rocc can be created by rocdemo.sca() or other constructors you might make using the code of rocdemo.sca() as a template.

rocdemo.sca

Examples

```r
set.seed(123)
R1 <- rocdemo.sca( rbinom(40,1,.3), rnorm(40), dxrule.sca,
caseLabel="new case", markerLabel="demo Marker" )
print(AUC(R1))
print(pAUC(R1,.3))
print(pAUCi(R1,.3))
print(ROC(R1,.3))
```
Methods

\texttt{x = rocc} plots an ROC curve object, with additional parameters available:

- \texttt{show.thresh (logical)}: should marker threshold values be plotted?
- \texttt{jit (logical)}: should plotted points be jittered?
- \texttt{add (logical)}: increment to current plot?
- \texttt{line (logical)}: plot points or lines?
- \texttt{threshCex (numeric)}: if showing threshold values, set character expansion in text call to this value
- \texttt{threshYsh (numeric)}: if showing threshold values, add this quantity to y coordinate of curve to plot the threshold value (should be negative for printing below point)
- \texttt{threshDig (numeric)}: if showing threshold values, use this as the digits parameter to round to display the threshold

... extra parameters passed to base \texttt{plot}, \texttt{lines} or \texttt{points} as needed

Examples

\begin{verbatim}
set.seed(123)
R1 <- rocdemo.sca( rbinom(40,1,.3), rnorm(40), dxrule.sca,
  caseLabel="new case", markerLabel="demo Marker" )
plot(R1, line=TRUE, show.thresh=TRUE, lwd=2, threshDig=2)
R2 <- rocdemo.sca( rbinom(40,1,.3), rnorm(40), dxrule.sca,
  caseLabel="new case", markerLabel="demo Marker" )
plot(R2, line=TRUE, add=TRUE, col="green", lwd=2 )
R3 <- rocdemo.sca( rbinom(40,1,.4), rnorm(40), dxrule.sca,
  caseLabel="new case", markerLabel="demo Marker" )
points(R3, col="red", pch=19)
\end{verbatim}

---

\textbf{rocc-class}

Class \texttt{rocc}, ROC curve representation

Description

object representing ROC curve, typically created using \texttt{rocdemo.sca}

Creating Objects

\begin{verbatim}
new('rocc',
  sens = ...., # Object of class numeric
  spec = ...., # Object of class numeric
  rule = ...., # Object of class function
  cuts = ...., # Object of class numeric
  markerLabel = ...., # Object of class character
  caseLabel = ...., # Object of class character
 )
\end{verbatim}
rocdemo.sca

Slots

sens: Object of class "numeric" sensitivity values
spec: Object of class "numeric" specificity values
rule: Object of class "function" rule to classify objects
cuts: Object of class "numeric" thresholds defining curve
markerLabel: Object of class "character" name of measured marker
caseLabel: Object of class "character" name of condition

Methods

plot (rocc, missing): a plotting function with some additional parameters

Examples

```r
set.seed(123)
R1 <- rocdemo.sca(rbinom(40,1,.3), rnorm(40), dxrule.sca,
                   caseLabel="new case", markerLabel="demo Marker" )
plot( R1, show.thresh=TRUE )
```

Description

rocdemo.sca – demonstrate 'rocc' class construction using a scalar marker and simple functional rule

Usage

```r
rocdemo.sca(truth, data, rule=NULL,
cutpts=NA,
markerLabel="unnamed marker", caseLabel="unnamed diagnosis")
```

Arguments

truth true classification of objects. Must take values 0 or 1.
data quantitative markers used to classify
rule rule: a function with arguments (x, thresh) returning 0 or 1. If no rule is provided or the standard rule dxrule.sca is passed, a faster C-based implementation is used to compute sensitivity and specificity.
cutpts values of thresholds; no NA allowed, or they will be recomputed using smallest gap between data points with distinct values
markerLabel textual label describing marker
caseLabel textual label describing classification

dxrule.sca is function (x, thresh) ifelse(x > thresh, 1, 0)
The default value of argument cutpts is a point less than min(data), points separating the unique values of data and a point greater than max(data).
trapezint

Value

an object of S4 class rocc

AUC

Examples

set.seed(123)
R1 <- rocdemo.sca(rbinom(40,1,.3), rnorm(40), caseLabel="new case", markerLabel="demo Marker")
plot(R1, line=TRUE, show.thresh=TRUE)

truth <- c(0, 1, 0, 1, 0, 1, 1)
data <- c(2, 3, 4, 4, 5, 6, 7, 8)
R2 <- rocdemo.sca(truth, data, dxrule.sca)
plot(R2, line=TRUE, show.thresh=TRUE)
R3 <- rocdemo.sca(truth, data, function(x, thresh) 1 - dxrule.sca(x, thresh))
if (AUC(R2) + AUC(R3) != 1) stop('Sum of AUCs should be 1.' )
# # more involved
#
# set.seed(1234)
x = runif(1000)
w = runif(1000)
z = rbinom(1000, 1, plogis(-2.7+6.2*x + .3*w))
m1 = glm(z~x, fam=binomial)
demorule.glm.clo = function(model) function(w,thresh)
  ifelse(predict(model, newdata=list(x=w), type="response")>thresh, 1, 0)
demorule.glm = demorule.glm.clo(m1)
R4 = rocdemo.sca(z, x, demorule.glm)
plot(R4)

trapezint

trapezoidal rule for AUC

Description

trapezoidal rule for AUC

Usage

trapezint(x, y, a, b)
Arguments

x  x - abscissae
y  y - ordinates
a  a - lower limit of integration
b  b - upper limit of integration

Details

uses approx

Value

estimated AUC

Examples

x <- sort(runif(30))
y <- sin(x)
print(trapezint(x,y,0,1))
