# Package ‘Rcpi’

December 22, 2016

**Type**: Package

**Title**: Toolkit for Compound-Protein Interaction in Drug Discovery

**Version**: 1.10.4

**Date**: 2016-11-30

**Description**: Rcpi offers a molecular informatics toolkit with a comprehensive integration of bioinformatics and chemoinformatics tools for drug discovery.

**Author**: Nan Xiao <me@nanx.me>, Dongsheng Cao, Qingsong Xu <qsxu@csu.edu.cn>

**Maintainer**: Nan Xiao <me@nanx.me>

**License**: Artistic-2.0

**URL**: [https://github.com/road2stat/Rcpi](https://github.com/road2stat/Rcpi)

**BugReports**: [https://github.com/road2stat/Rcpi/issues](https://github.com/road2stat/Rcpi/issues)

**LazyData**: yes

**Imports**: stats, utils, methods, RCurl, rjson, foreach, doParallel, Biostrings, GOSemSim, ChemmineR, fmcsR, rcdk (>= 3.3.8)

**Suggests**: RUnit, BiocGenerics

**Enhances**: ChemmineOB

**biocViews**: Software, DataImport, DataRepresentation, FeatureExtraction, Cheminformatics, BiomedicalInformatics, Proteomics, GO, SystemsBiology

**RoxygenNote**: 5.0.1

**NeedsCompilation**: no

AAA2DACOR

Description
2D Autocorrelations Descriptors for 20 Amino Acids calculated by Dragon

Usage
data(AA2DACOR)

Details
This dataset includes the 2D autocorrelations descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

Value
AA2DACOR data

Examples
data(AA2DACOR)
**AA3DMoRSE**

3D-MoRSE Descriptors for 20 Amino Acids calculated by Dragon

**Description**

3D-MoRSE Descriptors for 20 Amino Acids calculated by Dragon

**Usage**

data(AA3DMoRSE)

**Details**

This dataset includes the 3D-MoRSE descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

**Value**

AA3DMoRSE data

**Examples**

data(AA3DMoRSE)

---

**AAACF**

Atom-Centred Fragments Descriptors for 20 Amino Acids calculated by Dragon

**Description**

Atom-Centred Fragments Descriptors for 20 Amino Acids calculated by Dragon

**Usage**

data(AAACF)

**Details**

This dataset includes the atom-centred fragments descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

**Value**

AAACF data

**Examples**

data(AAACF)
Description
BLOSUM100 Matrix for 20 Amino Acids

Usage
data(AABLOSUM100)

Details
BLOSUM100 Matrix for the 20 amino acids. The matrix was extracted from the Biostrings package of Bioconductor.

Value
AABLOSUM100 data

Examples
data(AABLOSUM100)

Description
BLOSUM45 Matrix for 20 Amino Acids

Usage
data(AABLOSUM45)

Details
BLOSUM45 Matrix for the 20 amino acids. The matrix was extracted from the Biostrings package of Bioconductor.

Value
AABLOSUM45 data

Examples
data(AABLOSUM45)
### AABLOSUM50

**BLOSUM50 Matrix for 20 Amino Acids**

**Description**

BLOSUM50 Matrix for 20 Amino Acids

**Usage**

```r
data(AABLOSUM50)
```

**Details**

BLOSUM50 Matrix for the 20 amino acids. The matrix was extracted from the Biostrings package of Bioconductor.

**Value**

AABLOSUM50 data

**Examples**

```r
data(AABLOSUM50)
```

---

### AABLOSUM62

**BLOSUM62 Matrix for 20 Amino Acids**

**Description**

BLOSUM62 Matrix for 20 Amino Acids

**Usage**

```r
data(AABLOSUM62)
```

**Details**

BLOSUM62 Matrix for the 20 amino acids. The matrix was extracted from the Biostrings package of Bioconductor.

**Value**

AABLOSUM62 data

**Examples**

```r
data(AABLOSUM62)```
Description

BLOSUM80 Matrix for 20 Amino Acids

Usage

data(AABLOSUM80)

Details

BLOSUM80 Matrix for the 20 amino acids. The matrix was extracted from the Biostrings package of Bioconductor.

Value

AABLOSUM80 data

Examples

data(AABLOSUM80)

Description

Burden Eigenvalues Descriptors for 20 Amino Acids calculated by Dragon

Usage

data(AABurden)

Details

This dataset includes the Burden eigenvalues descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

Value

AABurden data

Examples

data(AABurden)
### AAConn

**Description**
Connectivity Indices Descriptors for 20 Amino Acids calculated by Dragon

**Usage**
data(AAConn)

**Details**
This dataset includes the connectivity indices descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

**Value**
AAConn data

**Examples**
data(AAConn)

### AAConst

**Description**
Constitutional Descriptors for 20 Amino Acids calculated by Dragon

**Usage**
data(AAConst)

**Details**
This dataset includes the constitutional descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

**Value**
AAConst data

**Examples**
data(AAConst)
CPSA Descriptors for 20 Amino Acids calculated by Discovery Studio

Description
CPSA Descriptors for 20 Amino Acids calculated by Discovery Studio

Usage
data(AACPSA)

Details
This dataset includes the CPSA descriptors of the 20 amino acids calculated by Discovery Studio (version 2.5) used for scales extraction in this package. All amino acid molecules had also been optimized with MOE 2011.10 (semiempirical AM1) before calculating these CPSA descriptors. The SDF file containing the information of the optimized amino acid molecules is included in this package. See OptAA3d for more information.

Value
AACPSA data

Examples
data(AACPSA)

All 2D Descriptors for 20 Amino Acids calculated by Dragon

Description
All 2D Descriptors for 20 Amino Acids calculated by Dragon

Usage
data(AADescAll)

Details
This dataset includes all the 2D descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

Value
AADescAll data

Examples
data(AADescAll)
### AAEigIdx

Description

Eigenvalue-Based Indices Descriptors for 20 Amino Acids calculated by Dragon

Usage

data(AAEigIdx)

Details

This dataset includes the eigenvalue-based indices descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

Value

AAEigIdx data

Examples

data(AAEigIdx)
**Description**

Functional Group Counts Descriptors for 20 Amino Acids calculated by Dragon

**Usage**

data(AAFGC)

**Details**

This dataset includes the functional group counts descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

**Value**

AAFGC data

**Examples**

data(AAFGC)

---

**AAGeom**

*Geometrical Descriptors for 20 Amino Acids calculated by Dragon*

**Description**

Geometrical Descriptors for 20 Amino Acids calculated by Dragon

**Usage**

data(AAGeom)

**Details**

This dataset includes the geometrical descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

**Value**

AAGeom data

**Examples**

data(AAGeom)
AAindex

Description
AAindex Data of 544 Physicochemical and Biological Properties for 20 Amino Acids

Usage
data(AAindex)

Details
The data was extracted from the AAindex1 database ver 9.1 (ftp://ftp.genome.jp/pub/db/community/aaindex/aaindex1) as of November 2012 (Data Last Modified 2006-08-14).
With this data, users could investigate each property’s accession number and other details. Visit http://www.genome.jp/dbget/aaiindex.html for more information.

Value
AAindex data

Examples
data(AAindex)
### AAInfo

**Description**

Information Indices Descriptors for 20 Amino Acids calculated by Dragon

**Usage**

data(AAInfo)

**Details**

This dataset includes the information indices descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

**Value**

AAInfo data

**Examples**

data(AAInfo)

### AAMetaInfo

**Description**

Meta Information for the 20 Amino Acids

**Usage**

data(AAMetaInfo)

**Details**

This dataset includes the meta information of the 20 amino acids used for the 2D and 3D descriptor calculation in this package. Each column represents:

- **AAName** Amino Acid Name
- **Short** One-Letter Representation
- **Abbreviation** Three-Letter Representation
- **mol** SMILE Representation
- **PUBCHEM_COMPOUND_CID** PubChem CID for the Amino Acid
- **PUBCHEM_LINK** PubChem Link for the Amino Acid
Value
AAMetaInfo data

Examples
data(AAMetaInfo)

---

**AAMOE2D**  
*2D Descriptors for 20 Amino Acids calculated by MOE 2011.10*

**Description**
2D Descriptors for 20 Amino Acids calculated by MOE 2011.10

**Usage**
data(AAMOE2D)

**Details**
This dataset includes the 2D descriptors of the 20 amino acids calculated by MOE 2011.10 used for scales extraction in this package.

**Value**
AAMOE2D data

**Examples**
data(AAMOE2D)

---

**AAMOE3D**  
*3D Descriptors for 20 Amino Acids calculated by MOE 2011.10*

**Description**
3D Descriptors for 20 Amino Acids calculated by MOE 2011.10

**Usage**
data(AAMOE3D)

**Details**
This dataset includes the 3D descriptors of the 20 amino acids calculated by MOE 2011.10 used for scales extraction in this package. All amino acid molecules had also been optimized with MOE (semiempirical AM1) before calculating these 3D descriptors. The SDF file containing the information of the optimized amino acid molecules is included in this package. See **OptAA3d** for more information.
**AAMolProp**

**Value**

AAMOE3D data

**Examples**

data(AAMOE3D)

---

| AAMolProp | Molecular Properties Descriptors for 20 Amino Acids calculated by Dragon |

**Description**

Molecular Properties Descriptors for 20 Amino Acids calculated by Dragon

**Usage**

data(AAMolProp)

**Details**

This dataset includes the molecular properties descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

**Value**

AAMolProp data

**Examples**

data(AAMolProp)

---

| AAPAM120 | PAM120 Matrix for 20 Amino Acids |

**Description**

PAM120 Matrix for 20 Amino Acids

**Usage**

data(AAPAM120)

**Details**

PAM120 Matrix for the 20 amino acids. The matrix was extracted from the Biostrings package of Bioconductor.
Value
AAPAM120 data

Examples
data(AAPAM120)

AAPAM250  PAM250 Matrix for 20 Amino Acids

Description
PAM250 Matrix for 20 Amino Acids

Usage
data(AAPAM250)

Details
PAM250 Matrix for the 20 amino acids. The matrix was extracted from the Biostrings package of Bioconductor.

Value
AAPAM250 data

Examples
data(AAPAM250)

AAPAM30  PAM30 Matrix for 20 Amino Acids

Description
PAM30 Matrix for 20 Amino Acids

Usage
data(AAPAM30)

Details
PAM30 Matrix for the 20 amino acids. The matrix was extracted from the Biostrings package of Bioconductor.
**Value**

AAPAM30 data

**Examples**

```r
data(AAPAM30)
```

---

**AAPAM40**  
*PAM40 Matrix for 20 Amino Acids*

**Description**

PAM40 Matrix for 20 Amino Acids

**Usage**

```r
data(AAPAM40)
```

**Details**

PAM40 Matrix for the 20 amino acids. The matrix was extracted from the Biostrings package of Bioconductor.

**Value**

AAPAM40 data

**Examples**

```r
data(AAPAM40)
```

---

**AAPAM70**  
*PAM70 Matrix for 20 Amino Acids*

**Description**

PAM70 Matrix for 20 Amino Acids

**Usage**

```r
data(AAPAM70)
```

**Details**

PAM70 Matrix for the 20 amino acids. The matrix was extracted from the Biostrings package of Bioconductor.
Value
AAPAM70 data

Examples
data(AAPAM70)

<table>
<thead>
<tr>
<th>AARandic</th>
<th>Randic Molecular Profiles Descriptors for 20 Amino Acids calculated by Dragon</th>
</tr>
</thead>
</table>

Description
Randic Molecular Profiles Descriptors for 20 Amino Acids calculated by Dragon

Usage
data(AARandic)

Details
This dataset includes the Randic molecular profiles descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

Value
AARandic data

Examples
data(AARandic)

<table>
<thead>
<tr>
<th>AARDF</th>
<th>RDF Descriptors for 20 Amino Acids calculated by Dragon</th>
</tr>
</thead>
</table>

Description
RDF Descriptors for 20 Amino Acids calculated by Dragon

Usage
data(AARDF)

Details
This dataset includes the RDF descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.
AATopo

Value

AARDF data

Examples

data(AARDF)

AATopo

Topological Descriptors for 20 Amino Acids calculated by Dragon

Description

Topological Descriptors for 20 Amino Acids calculated by Dragon

Usage

data(AATopo)

Details

This dataset includes the topological descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

Value

AATopo data

Examples

data(AATopo)

AATopoChg

Topological Charge Indices Descriptors for 20 Amino Acids calculated by Dragon

Description

Topological Charge Indices Descriptors for 20 Amino Acids calculated by Dragon

Usage

data(AATopoChg)

Details

This dataset includes the topological charge indices descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.
Value
AA topoChg data

Examples
data(AATopoChg)

### AAWalk

| AAWalk | Walk and Path Counts Descriptors for 20 Amino Acids calculated by Dragon |

---

Description
Walk and Path Counts Descriptors for 20 Amino Acids calculated by Dragon

Usage
data(AAWalk)

Details
This dataset includes the walk and path counts descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.

Value
AAWalk data

Examples
data(AAWalk)

---

### AAWHM

| AAWHM | WHIM Descriptors for 20 Amino Acids calculated by Dragon |

---

Description
WHIM Descriptors for 20 Amino Acids calculated by Dragon

Usage
data(AAWHM)

Details
This dataset includes the WHIM descriptors of the 20 amino acids calculated by Dragon (version 5.4) used for scales extraction in this package.
Value
AAWHIM data

Examples
data(AAWHIM)

---

### Description
Auto Cross Covariance (ACC) for Generating Scales-Based Descriptors of the Same Length

#### Usage
```
acc(mat, lag)
```

#### Arguments
- `mat`: A p * n matrix. Each row represents one scale (total p scales), each column represents one amino acid position (total n amino acids).
- `lag`: The lag parameter. Must be less than the amino acids.

#### Details
This function calculates the auto covariance and auto cross covariance for generating scale-based descriptors of the same length.

#### Value
A length lag * p^2 named vector, the element names are constructed by: the scales index (crossed scales index) and lag index.

#### Note
To know more details about auto cross covariance, see the references.

#### Author(s)
Nan Xiao <http://nanx.me>

#### References

calcDrugFPSim

See Also
See extractPCM.Scales for generalized scales-based descriptors. For more details, see extractPCM.Desc.Scales and extractPCM.Prop.Scales.

Examples

def p = 8  # p is the scales number
def n = 200  # n is the amino acid number

def lag = 7  # the lag parameter

def mat = matrix(rnorm(p * n), nrow = p, ncol = n)

def acc(mat, lag)

Description
Calculate Drug Molecule Similarity Derived by Molecular Fingerprints

Usage

calcDrugFPSim(fp1, fp2, fptype = c("compact", "complete"),
metric = c("tanimoto", "euclidean", "cosine", "dice", "hamming"))

Arguments
fp1 The first molecule’s fingerprints, could be extracted by extractDrugMACCS(), extractDrugMACCSClomplete() etc.
fp2 The second molecule’s fingerprints.
fptype The fingerprint type, must be one of “compact” or “complete”.
metric The similarity metric, one of “tanimoto”, “euclidean”, “cosine”, “dice” and “hamming”.

Details
This function calculate drug molecule fingerprints similarity. Define a as the features of object A, b is the features of object B, c is the number of common features to A and B:

- Tanimoto: aka Jaccard - \( c / (a + b + c) \)
- Euclidean: \( \sqrt{(a + b)} \)
- Dice: aka Sorensen, Czekanowski, Hodgkin-Richards - \( c / 0.5[(a + c) + (b + c)] \)
- Cosine: aka Ochiai, Carbo - \( c / \sqrt{(a + c)(b + c)} \)
- Hamming: aka Manhattan, taxi-cab, city-block distance - \( (a + b) \)

Value
The numeric similarity value.
calcDrugMCSSim

Calculate Drug Molecule Similarity Derived by Maximum Common Substructure Search

Description

Calculate Drug Molecule Similarity Derived by Maximum Common Substructure Search

Usage

calcDrugMCSSim(mol1, mol2, type = c("smile", "sdf"), plot = FALSE, a1 = 0, au = 0, bl = 0, bu = 0, matching.mode = "static", ...)

Arguments

mol1 The first molecule. R character string object containing the molecule. See examples.
mol2 The second molecule. R character string object containing the molecule. See examples.
type The input molecule format, 'smile' or 'sdf'.
plot Logical. Should we plot the two molecules and their maximum common substructure?
a1 Lower bound for the number of atom mismatches. Default is 0.
**Details**

This function calculates drug molecule similarity derived by maximum common substructure search. The maximum common substructure search algorithm is provided by the fmcsR package.

**Value**

A list containing the detail MCS information and similarity values. The numeric similarity value includes Tanimoto coefficient and overlap coefficient.

**Author(s)**

Nan Xiao <http://nanx.me>

**References**

**Examples**

```r
mol1 = 'CC(C)CCCCCC(=O)NCC1=CC(=C(C=C1)O)OC'
mol2 = 'O=C(NCc1cc(OC)c(O)cc1)CCCC/C=C/C(C)C'

**CalcParProtGOSim**

Protein Sequence Similarity Calculation based on Gene Ontology (GO) Similarity

**Description**

Protein Sequence Similarity Calculation based on Gene Ontology (GO) Similarity

**Usage**

```r
calcParProtGOSim(golist, type = c("go", "gene"), ont = "MF", organism = "human", measure = "Resnik", combine = "BMA")
```
calcParProtGOSim

Arguments

golist  A character vector, each component contains a character vector of GO terms or one Entrez Gene ID.
type    Input type of golist, 'go' for GO Terms, 'gene' for gene ID.
ton      Default is 'MF', could be one of 'MF', 'BP', or 'CC' subontologies.
organism Default is 'human', could be one of 'anopheles', 'arabidopsis', 'bovine', 'canine', 'chicken', 'chimp', 'coelicolor', 'ecolik12', 'ecsakai', 'fly', 'human', 'malaria', 'mouse', 'pig', 'rat', 'rhesus', 'worm', 'xenopus', 'yeast' or 'zebrafish'.
measure Default is 'Resnik', could be one of 'Resnik', 'Lin', 'Rel', 'Jiang' or 'Wang'.
combine Default is 'BMA', could be one of 'max', 'average', 'rcmax' or 'BMA' for combining semantic similarity scores of multiple GO terms associated with protein.

Details

This function calculates protein sequence similarity based on Gene Ontology (GO) similarity.

Value

A n x n similarity matrix.

Author(s)

Nan Xiao <http://nanx.me>

See Also

See calcTwoProtGOSim for calculating the GO semantic similarity between two groups of GO terms or two Entrez gene IDs. See calcParProtSeqSim for paralleled protein similarity calculation based on sequence alignment.

Examples

# by GO Terms
go1 = c('GO:0005215', 'GO:0005488', 'GO:0005515', 'GO:0005625', 'GO:0005802', 'GO:0005905')  # AP4B1
go2 = c('GO:0005515', 'GO:0005634', 'GO:0005681', 'GO:0008380', 'GO:0031202')  # BCAS2
go3 = c('GO:0003735', 'GO:0005622', 'GO:0005840', 'GO:0006412')  # PDE4DIP
glist = list(go1, go2, go3)
gsimmat1 = calcParProtGOSim(glist, type = 'go', ont = 'CC')
print(gsimmat1)

# by Entrez gene id
genelist = list(c(150, 151, 152, 1814, 1815, 1816))
gsimmat2 = calcParProtGOSim(genelist, type = 'gene')
print(gsimmat2)
calcParProtSeqSim

Parallelized Protein Sequence Similarity Calculation based on Sequence Alignment

Description

Parallelized Protein Sequence Similarity Calculation based on Sequence Alignment

Usage

calcParProtSeqSim(protlist, cores = 2, type = "local",
                   submat = "BLOSUM62")

Arguments

- **protlist**: A length \( n \) list containing \( n \) protein sequences, each component of the list is a character string, storing one protein sequence. Unknown sequences should be represented as '\'.
- **cores**: Integer. The number of CPU cores to use for parallel execution, default is 2. Users could use the `detectCores()` function in the `parallel` package to see how many cores they could use.
- **type**: Type of alignment, default is 'local', could be 'global' or 'local', where 'global' represents Needleman-Wunsch global alignment; 'local' represents Smith-Waterman local alignment.
- **submat**: Substitution matrix, default is 'BLOSUM62', could be one of 'BLOSUM45', 'BLOSUM50', 'BLOSUM62', 'BLOSUM80', 'BLOSUM100', 'PAM30', 'PAM40', 'PAM70', 'PAM120', 'PAM250'.

Details

This function implemented the parallellized version for calculating protein sequence similarity based on sequence alignment.

Value

A \( n \times n \) similarity matrix.

Author(s)

Nan Xiao <http://nanx.me>

See `calcTwoProtSeqSim` for protein sequence alignment for two protein sequences. See `calcParProtGOSim` for protein similarity calculation based on Gene Ontology (GO) semantic similarity.
Examples

```r
s1 = readFASTA(system.file('proteins/P00750.fasta', package = 'Rcpp'))[[1]]
s2 = readFASTA(system.file('proteins/P08218.fasta', package = 'Rcpp'))[[1]]
s3 = readFASTA(system.file('proteins/P10323.fasta', package = 'Rcpp'))[[1]]
s4 = readFASTA(system.file('proteins/P20160.fasta', package = 'Rcpp'))[[1]]
s5 = readFASTA(system.file('proteins/Q9NZP8.fasta', package = 'Rcpp'))[[1]]
plist = list(s1, s2, s3, s4, s5)

psimmat = calcParProtSeqSim(plist, cores = 2, type = 'local',
                     submat = 'BLOSUM62')
print(psimmat)
```

calcTwoProtGOSim

Protein Similarity Calculation based on Gene Ontology (GO) Similarity

Description

Protein Similarity Calculation based on Gene Ontology (GO) Similarity

Usage

```r
calcTwoProtGOSim(id1, id2, type = c("go", "gene"), ont = "MF",
                 organism = "human", measure = "Resnik", combine = "BMA")
```

Arguments

- **id1**: A character vector. length > 1: each element is a GO term; length = 1: the Entrez Gene ID.
- **id2**: A character vector. length > 1: each element is a GO term; length = 1: the Entrez Gene ID.
- **type**: Input type of id1 and id2, 'go' for GO Terms, 'gene' for gene ID.
- **ont**: Default is 'MF', could be one of 'MF', 'BP', or 'CC' subontologies.
- **organism**: Default is 'human', could be one of 'anopheles', 'arabidopsis', 'bovine',
  'canine', 'chicken', 'chimp', 'coelicolor', 'ecolik12', 'ecsakai', 'fly',
  'human', 'malaria', 'mouse', 'pig', 'rat', 'rhesus', 'worm', 'xenopus',
  'yeast' or 'zebrafish'.
- **measure**: Default is 'Resnik', could be one of 'Resnik', 'Lin', 'Rel', 'Jiang' or 'Wang'.
- **combine**: Default is 'BMA', could be one of 'max', 'average', 'rcmax' or 'BMA' for combining semantic similarity scores of multiple GO terms associated with protein.

Details

This function calculates the Gene Ontology (GO) similarity between two groups of GO terms or two Entrez gene IDs.

Value

A n x n matrix.
calcTwoProtSeqSim

Protein Sequence Alignment for Two Protein Sequences

Description

Protein Sequence Alignment for Two Protein Sequences

Usage

calcTwoProtSeqSim(seq1, seq2, type = "local", submat = "BLOSUM62")

Arguments

  seq1  A character string, containing one protein sequence.
  seq2  A character string, containing another protein sequence.
  type  Type of alignment, default is 'local', could be 'global' or 'local', where 'global' represents Needleman-Wunsch global alignment; 'local' represents Smith-Waterman local alignment.
  submat  Substitution matrix, default is 'BLOSUM62', could be one of 'BLOSUM45', 'BLOSUM50', 'BLOSUM62', 'BLOSUM80', 'BLOSUM100', 'PAM30', 'PAM40', 'PAM70', 'PAM120', 'PAM250'.

Details

This function implements the sequence alignment between two protein sequences.

Examples

# by GO terms
go1 = c("GO:0004022", "GO:0004024", "GO:0004023")
go2 = c("GO:0009055", "GO:0020037")
gsim1 = calcTwoProtGOSim(go1, go2, type = 'go', ont = 'MF', measure = 'Wang')
print(gsim1)

# by Entrez gene id
gene1 = '241'
gene2 = '251'
gsim2 = calcTwoProtGOSim(gene1, gene2, type = 'gene', ont = 'CC', measure = 'Lin')
print(gsim2)
checkProt

Value

An Biostrings object containing the scores and other alignment information.

Author(s)

Nan Xiao <http://nanx.me>

See Also

See `calcParProtSeqSim` for paralleled pairwise protein similarity calculation based on sequence alignment. See `calcTwoProtGOSim` for calculating the GO semantic similarity between two groups of GO terms or two Entrez gene IDs.

Examples

```r
s1 = readFASTA(system.file('proteins/ProtProtSeq/P00750.fasta', package = 'Rcpp'))[[1]]
s2 = readFASTA(system.file('proteins/ProtProtSeq/P10323.fasta', package = 'Rcpp'))[[1]]
seqalign = calcTwoProtSeqSim(s1, s2)
slot(seqalign, "score")
```

---

class(checkProt) Check if the protein sequence’s amino acid types are the 20 default types

Description

Check if the protein sequence’s amino acid types are the 20 default types

Usage

`checkProt(x)`

Arguments

x A character vector, as the input protein sequence.

Details

This function checks if the protein sequence’s amino acid types are the 20 default types.

Value

Logical. `TRUE` if all of the amino acid types of the sequence are within the 20 default types.

Author(s)

Nan Xiao <http://nanx.me>
convMolFormat

Examples

```r
x = readFASTA(system.file('protseq/P00750.fasta', package = 'Rcpi'))[[1]]
checkProt(x)  # TRUE
cHECK(PASTE(x, 'Z', sep = ' '))  # FALSE
```

convMolFormat  

Chemical File Formats Conversion

Description

Chemical File Formats Conversion

Usage

`convMolFormat(infile, outfile, from, to)`

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>infile</code></td>
<td>A character string. Indicating the input file location.</td>
</tr>
<tr>
<td><code>outfile</code></td>
<td>A character string. Indicating the output file location.</td>
</tr>
<tr>
<td><code>from</code></td>
<td>The format of <code>infile</code>. A character string supported by OpenBabel. See the note section for the supported formats.</td>
</tr>
<tr>
<td><code>to</code></td>
<td>The desired format of <code>outfile</code>. A character string supported by OpenBabel. See the note section for the supported formats.</td>
</tr>
</tbody>
</table>

Details

This function converts between various chemical file formats via OpenBabel. The complete supported file format list could be found at [http://openbabel.org/docs/dev/FileFormats/Overview.html](http://openbabel.org/docs/dev/FileFormats/Overview.html).

Value

`NULL`

Note

The supported formats include:

- `abinit` – ABINIT Output Format [Read-only]
- `acr` – ACR format [Read-only]
- `adf` – ADF cartesian input format [Write-only]
- `adfout` – ADF output format [Read-only]
- `alc` – Alchemy format
- `arc` – Accelrys/MSI Biosym/Insight II CAR format [Read-only]
- `axsf` – XCrySDen Structure Format [Read-only]
- `bgf` – MSI BGF format
- `box` – Dock 3.5 Box format

Examples

def sdf = system.file('sysdata/QptAA3d.sdf', package = 'Rcpi')
# SDF to SMILES

cnvMolFormat(infile = sdf, outfile = 'aa.smi',
             from = 'sdf', to = 'smiles')
# SMILES to MOPAC Cartesian format

cnvMolFormat(infile = 'aa.smi', outfile = 'aa.mop',
             from = 'smiles', to = 'mop')
extractDrugAIO  
**Calculates All the Molecular Descriptors in the Rcpi Package at Once**

**Description**

Calculates All the Molecular Descriptors in the Rcpi Package at Once

**Usage**

```r
extractDrugAIO(molecules, silent = TRUE, warn = TRUE)
```

**Arguments**

- `molecules`  
  Parsed molecule object.

- `silent`  
  Logical. Whether the calculating process should be shown or not, default is `TRUE`.

- `warn`  
  Logical. Whether the warning about some descriptors need the 3D coordinates should be shown or not after the calculation, default is `TRUE`.

**Details**

This function calculates all the molecular descriptors in the Rcpi package at once.

**Value**

A data frame, each row represents one of the molecules, each column represents one descriptor. Currently, this function returns total 293 descriptors composed of 48 descriptor types.

**Note**

Note that we need 3-D coordinates of the molecules to calculate some of the descriptors, if not provided, these descriptors values will be `NA`.

**Author(s)**

Nan Xiao [http://nanx.me](http://nanx.me)

**Examples**

```r
# Load 20 small molecules that have 3D coordinates
sdf = system.file('sysdata/OptAA3d.sdf', package = 'Rcpi')

mol = readMolFromSDF(sdf)
dat = extractDrugAIO(mol, warn = FALSE)
```
extractDrugALOGP  Calculates Atom Additive logP and Molar Refractivity Values Descriptor

Description

Calculates Atom Additive logP and Molar Refractivity Values Descriptor

Usage

extractDrugALOGP(molecules, silent = TRUE)

Arguments

- molecules: Parsed molecule object.
- silent: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Calculates ALOGP (Ghose-Crippen LogKow) and the Ghose-Crippen molar refractivity as described by Ghose, A.K. and Crippen, G.M. Note the underlying code in CDK assumes that aromaticity has been detected before evaluating this descriptor. The code also expects that the molecule will have hydrogens explicitly set. For SD files, this is usually not a problem since hydrogens are explicit. But for the case of molecules obtained from SMILES, hydrogens must be made explicit.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns three columns named ALogP, ALogp2 and AMR.

Author(s)

Nan Xiao <http://nanx.me>

References

Examples

smi = system.file('vignettes/FOAMDD.smi', package = 'Rcpp')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugALOGP(mol)
head(dat)
extractDrugAminoAcidCount

Calculates the Number of Amino Acids Descriptor

Description
Calculates the Number of Amino Acids Descriptor

Usage
extractDrugAminoAcidCount(molecules, silent = TRUE)

Arguments
- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details
Calculates the number of each amino acids (total 20 types) found in the molecules.

Value
A data frame, each row represents one of the molecules, each column represents one feature. This function returns 20 columns named nA, nR, nN, nD, nC, nF, nQ, nE, nG, nH, nI, nP, nL, nK, nM, nS, nT, nY, nV, nW.

Author(s)
Nan Xiao <http://nanx.me>

Examples
```r
smi = system.file('vignettes/Rcpi/vignettes/Var/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugAminoAcidCount(mol)
head(dat)
```

extractDrugApol

Calculates the Sum of the Atomic Polarizabilities Descriptor

Description
Calculates the Sum of the Atomic Polarizabilities Descriptor

Usage
extractDrugApol(molecules, silent = TRUE)
extractDrugAromaticAtomsCount

Arguments

molecules  Parsed molecule object.
silent     Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Calculates the number of aromatic atoms of a molecule.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named apol.

Author(s)

Nan Xiao <http://nanx.me>

Examples

```r
smi = system.file('vignettedata/FOAMDD.smi', package = 'Repi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugAromaticAtomsCount(mol)
head(dat)
```

extractDrugAromaticAtomsCount

*Calculates the Number of Aromatic Atoms Descriptor*

Description

Calculates the Number of Aromatic Atoms Descriptor

Usage

```r
extractDrugAromaticAtomsCount(molecules, silent = TRUE)
```
extractDrugAromaticBondsCount

Value
A data frame, each row represents one of the molecules, each column represents one feature. This
function returns one column named nAromAtom.

Author(s)
Nan Xiao <http://nan.x.me>

Examples
```r
smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugAromaticAtomsCount(mol)
head(dat)
```

extractDrugAromaticBondsCount

*Calculates the Number of Aromatic Bonds Descriptor*

Description
Calculates the Number of Aromatic Bonds Descriptor

Usage
```r
extractDrugAromaticBondsCount(molecules, silent = TRUE)
```

Arguments
- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details
Calculates the number of aromatic bonds of a molecule.

Value
A data frame, each row represents one of the molecules, each column represents one feature. This
function returns one column named nAromBond.

Author(s)
Nan Xiao <http://nan.x.me>

Examples
```r
smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugAromaticBondsCount(mol)
head(dat)
```
**extractDrugAtomCount**  
Calculates the Number of Atom Descriptor

**Description**  
Calculates the Number of Atom Descriptor

**Usage**  
```r  
extRACTDrugAtomCount(molecules, silent = TRUE)  
```

**Arguments**  
molecules: Parsed molecule object.  
silent: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**  
Calculates the number of atoms of a certain element type in a molecule. By default it returns the count of all atoms.

**Value**  
A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named nAtom.

**Author(s)**  
Nan Xiao &lt;http://nanx.me&gt;

**Examples**  
```r  
smi = system.file('vignettes/FDAEDD.smi', package = 'Rcpp')  
mol = readMolFromSmi(smi, type = 'mol')  
dat = extractDrugAtomCount(mol)  
head(dat)  
```

---

**extractDrugAutocorrelationCharge**  
Calculates the Moreau-Broto Autocorrelation Descriptors using Partial Charges

**Description**  
Calculates the Moreau-Broto Autocorrelation Descriptors using Partial Charges

**Usage**  
```r  
extRACTDrugAutocorrelationCharge(molecules, silent = TRUE)  
```

**Examples**  
```r  
smi = system.file('vignettes/FDAEDD.smi', package = 'Rcpp')  
mol = readMolFromSmi(smi, type = 'mol')  
dat = extractDrugAutocorrelationCharge(mol)  
head(dat)  
```
extractDrugAutocorrelationMass

Arguments
molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details
Calculates the ATS autocorrelation descriptor, where the weight equal to the charges.

Value
A data frame, each row represents one of the molecules, each column represents one feature. This function returns 5 columns named ATSc1, ATSc2, ATSc3, ATSc4, ATSc5.

Author(s)
Nan Xiao <http://nanx.me>

Examples
smi = system.file("/vignettes/FOAMDD.smi", package = "Rcpi")
mol = readMolFromSmi(smi, type = "mol")
dat = extractDrugAutocorrelationCharge(mol)
head(dat)

extractDrugAutocorrelationMass
Calculates the Moreau-Broto Autocorrelation Descriptors using Atomic Weight

Description
Calculates the Moreau-Broto Autocorrelation Descriptors using Atomic Weight

Usage
extractDrugAutocorrelationMass(molecules, silent = TRUE)

Arguments
molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details
Calculates the ATS autocorrelation descriptor, where the weight equal to the scaled atomic mass.
extractDrugAutocorrelationPolarizability

Value
A data frame, each row represents one of the molecules, each column represents one feature. This function returns 5 columns named ATSm1, ATSm2, ATSm3, ATSm4, ATSm5.

Author(s)
Nan Xiao <http://nanx.me>

head(dat)

extractDrugAutocorrelationPolarizability

Calculates the Moreau-Broto Autocorrelation Descriptors using Polarizability

Description
Calculates the Moreau-Broto Autocorrelation Descriptors using Polarizability

Usage
extractDrugAutocorrelationPolarizability(molecules, silent = TRUE)

Arguments
molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details
Calculates the ATS autocorrelation descriptor using polarizability.

Value
A data frame, each row represents one of the molecules, each column represents one feature. This function returns 5 columns named ATSp1, ATSp2, ATSp3, ATSp4, ATSp5.

Author(s)
Nan Xiao <http://nanx.me>
**extractDrugBCUT**

**Examples**

```r
smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugAutocorrelationPolarizability(mol)
head(dat)
```

**Description**

BCUT – Eigenvalue Based Descriptor

**Usage**

```r
extractDrugBCUT(molecules, silent = TRUE)
```

**Arguments**

- **molecules**: Parsed molecule object.
- **silent**: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

Eigenvalue based descriptor noted for its utility in chemical diversity. Described by Pearlman et al. The descriptor is based on a weighted version of the Burden matrix which takes into account both the connectivity as well as atomic properties of a molecule. The weights are a variety of atom properties placed along the diagonal of the Burden matrix. Currently three weighting schemes are employed:

- Atomic Weight
- Partial Charge (Gasteiger Marsilli)
- Polarizability (Kang et al.)

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 6 columns:

- BCUTw-1l, BCUTw-2l . . . - n high lowest atom weighted BCUTS
- BCUTw-1h, BCUTw-2h . . . - n low highest atom weighted BCUTS
- BCUTc-1l, BCUTc-2l . . . - n high lowest partial charge weighted BCUTS
- BCUTc-1h, BCUTc-2h . . . - n low highest partial charge weighted BCUTS
- BCUTp-1l, BCUTp-2l . . . - n high lowest polarizability weighted BCUTS
- BCUTp-1h, BCUTp-2h . . . - n low highest polarizability weighted BCUTS
extractDrugBondCount

Note

By default, the descriptor will return the highest and lowest eigenvalues for the three classes of descriptor in a single ArrayList (in the order shown above). However it is also possible to supply a parameter list indicating how many of the highest and lowest eigenvalues (for each class of descriptor) are required. The descriptor works with the hydrogen depleted molecule.

A side effect of specifying the number of highest and lowest eigenvalues is that it is possible to get two copies of all the eigenvalues. That is, if a molecule has 5 heavy atoms, then specifying the 5 highest eigenvalues returns all of them, and specifying the 5 lowest eigenvalues returns all of them, resulting in two copies of all the eigenvalues.

Note that it is possible to specify an arbitrarily large number of eigenvalues to be returned. However if the number (i.e., nhigh or nlow) is larger than the number of heavy atoms, the remaining eigenvalues will be NaN.

Given the above description, if the aim is to get all the eigenvalues for a molecule, you should set nlow to 0 and specify the number of heavy atoms (or some large number) for nhigh (or vice versa).

```

extractDrugBondCount  Calculates the Descriptor Based on the Number of Bonds of a Certain Bond Order

Description

Calculates the Descriptor Based on the Number of Bonds of a Certain Bond Order

Usage

```r
extractDrugBondCount(molecules, silent = TRUE)
```
extractDrugBPoL

Arguments

molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Calculates the descriptor based on the number of bonds of a certain bond order.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named nB.

Author(s)

Nan Xiao <http://nanx.me>

Examples

```r
smi = system.file('vignette/data/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugBondCount(mol)
head(dat)
```

extractDrugBPoL  Calculates the Descriptor that Describes the Sum of the Absolute Value of the Difference between Atomic Polarizabilities of All Bonded Atoms in the Molecule

Description

Calculates the Descriptor that Describes the Sum of the Absolute Value of the Difference between Atomic Polarizabilities of All Bonded Atoms in the Molecule

Usage

`extractDrugBPoL(molecules, silent = TRUE)`

Arguments

molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

This descriptor calculates the sum of the absolute value of the difference between atomic polarizabilities of all bonded atoms in the molecule (including implicit hydrogens) with polarizabilities taken from http://www.sunysccc.edu/academic/mst/pTable/p-table2.htm. This descriptor assumes 2-centered bonds.
**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named `bpol`.

**Author(s)**

Nan Xiao <http://nanx.me>

**Examples**

```r
smi = system.file('vignettes/FOAMD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugBPoi(mol)
head(dat)
```

**extractDrugCarbonTypes**

*Topological Descriptor Characterizing the Carbon Connectivity in Terms of Hybridization*

**Description**

Topological Descriptor Characterizing the Carbon Connectivity in Terms of Hybridization

**Usage**

```r
extractDrugCarbonTypes(molecules, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is `TRUE`.

**Details**

Calculates the carbon connectivity in terms of hybridization. The function calculates 9 descriptors in the following order:

- C1SP1 - triply bound carbon bound to one other carbon
- C2SP1 - triply bound carbon bound to two other carbons
- C1SP2 - doubly bound carbon bound to one other carbon
- C2SP2 - doubly bound carbon bound to two other carbons
- C3SP2 - doubly bound carbon bound to three other carbons
- C1SP3 - singly bound carbon bound to one other carbon
- C2SP3 - singly bound carbon bound to two other carbons
- C3SP3 - singly bound carbon bound to three other carbons
- C4SP3 - singly bound carbon bound to four other carbons
Value
A data frame, each row represents one of the molecules, each column represents one feature. This function returns 9 columns named C1SP1, C2SP1, C1SP2, C2SP2, C3SP2, C1SP3, C2SP3, C3SP3 and C4SP3.

Author(s)
Nan Xiao <http://nanx.me>

Examples
```r
smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugCarbonTypes(mol)
head(dat)
```

Description
Calculate the Kier and Hall Chi Chain Indices of Orders 3, 4, 5, 6 and 7

Usage
```r
extractDrugChiChain(molecules, silent = TRUE)
```

Arguments
- **molecules**: Parsed molecule object.
- **silent**: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details
Evaluates chi chain descriptors. The code currently evaluates the simple and valence chi chain descriptors of orders 3, 4, 5, 6 and 7. It utilizes the graph isomorphism code of the CDK to find fragments matching SMILES strings representing the fragments corresponding to each type of chain.

Value
A data frame, each row represents one of the molecules, each column represents one feature. This function returns 10 columns, in the following order:

- **SCH.3**: Simple chain, order 3
- **SCH.4**: Simple chain, order 4
- **SCH.5**: Simple chain, order 5
- **SCH.6**: Simple chain, order 6
- **SCH.7**: Simple chain, order 7
extractDrugChiCluster

- VCH.3 - Valence chain, order 3
- VCH.4 - Valence chain, order 4
- VCH.5 - Valence chain, order 5
- VCH.6 - Valence chain, order 6
- VCH.7 - Valence chain, order 7

Note

These descriptors are calculated using graph isomorphism to identify the various fragments. As a result calculations may be slow. In addition, recent versions of Molconn-Z use simplified fragment definitions (i.e., rings without branches etc.) whereas these descriptors use the older more complex fragment definitions.

Author(s)

Nan Xiao <http://nanx.me>

Examples

```r
smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugChiChain(mol)
head(dat)
```

extractDrugChiCluster  Evaluates the Kier and Hall Chi cluster indices of orders 3, 4, 5 and 6

Description

Evaluates the Kier and Hall Chi cluster indices of orders 3, 4, 5 and 6

Usage

```r
extractDrugChiCluster(molecules, silent = TRUE)
```

Arguments

- `molecules`  Parsed molecule object.
- `silent` Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Evaluates chi cluster descriptors. It utilizes the graph isomorphism code of the CDK to find fragments matching SMILES strings representing the fragments corresponding to each type of chain.
Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 8 columns, the order and names of the columns returned is:

- SC.3 - Simple cluster, order 3
- SC.4 - Simple cluster, order 4
- SC.5 - Simple cluster, order 5
- SC.6 - Simple cluster, order 6
- VC.3 - Valence cluster, order 3
- VC.4 - Valence cluster, order 4
- VC.5 - Valence cluster, order 5
- VC.6 - Valence cluster, order 6

Note

These descriptors are calculated using graph isomorphism to identify the various fragments. As a result calculations may be slow. In addition, recent versions of Molconn-Z use simplified fragment definitions (i.e., rings without branches etc.) whereas these descriptors use the older more complex fragment definitions.

head(dat)
```

extractDrugChiPath

**Calculate the Kier and Hall Chi Path Indices of Orders 0 to 7**

Description

Calculate the Kier and Hall Chi Path Indices of Orders 0 to 7

Usage

`extractDrugChiPath(molecules, silent = TRUE)`

Arguments

- `molecules` Parsed molecule object.
- `silent` Logical. Whether the calculating process should be shown or not, default is TRUE.
Details

Evaluates chi path descriptors. This function utilizes the graph isomorphism code of the CDK to find fragments matching SMILES strings representing the fragments corresponding to each type of chain.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 16 columns. The order and names of the columns returned is:

- SP.0, SP.1, ..., SP.7 - Simple path, orders 0 to 7
- VP.0, VP.1, ..., VP.7 - Valence path, orders 0 to 7

Note

These descriptors are calculated using graph isomorphism to identify the various fragments. As a result calculations may be slow. In addition, recent versions of Molconn-Z use simplified fragment definitions (i.e., rings without branches etc.) whereas these descriptors use the older more complex fragment definitions.

Author(s)

Nan Xiao <http://nanx.me>

Examples

```r
smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')

head(dat)
```

**extractDrugChiPathCluster**

*Calculate the Kier and Hall Chi Path Cluster Indices of Orders 4, 5 and 6*

Description

Calculate the Kier and Hall Chi Path Cluster Indices of Orders 4, 5 and 6

Usage

```r
extractDrugChiPathCluster(molecules, silent = TRUE)
```

Arguments

- **molecules**  
  Parsed molecule object.
- **silent**  
  Logical. Whether the calculating process should be shown or not, default is TRUE.
Details

Evaluates chi path cluster descriptors. The code currently evaluates the simple and valence chi chain descriptors of orders 4, 5 and 6. It utilizes the graph isomorphism code of the CDK to find fragments matching SMILES strings representing the fragments corresponding to each type of chain.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 6 columns named SPC.4, SPC.5, SPC.6, VPC.4, VPC.5, VPC.6:

- SPC.4 - Simple path cluster, order 4
- SPC.5 - Simple path cluster, order 5
- SPC.6 - Simple path cluster, order 6
- VPC.4 - Valence path cluster, order 4
- VPC.5 - Valence path cluster, order 5
- VPC.6 - Valence path cluster, order 6

Note

These descriptors are calculated using graph isomorphism to identify the various fragments. As a result calculations may be slow. ```r
extractDrugCPSA( A Variety of Descriptors Combining Surface Area and Partial Charge Information
```

Description

A Variety of Descriptors Combining Surface Area and Partial Charge Information

Usage

```r
extractDrugCPSA(molecules, silent = TRUE)
```
Arguments

molecules: Parsed molecule object.
silent: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Calculates 29 Charged Partial Surface Area (CPSA) descriptors. The CPSA's were developed by Stanton et al.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 29 columns:

• PPSA.1 - partial positive surface area – sum of surface area on positive parts of molecule
• PPSA.2 - partial positive surface area * total positive charge on the molecule
• PPSA.3 - charge weighted partial positive surface area
• PNSA.1 - partial negative surface area – sum of surface area on negative parts of molecule
• PNSA.2 - partial negative surface area * total negative charge on the molecule
• PNSA.3 - charge weighted partial negative surface area
• DPSA.1 - difference of PPSA.1 and PNSA.1
• DPSA.2 - difference of FPSA.2 and PNSA.2
• DPSA.3 - difference of PPSA.3 and PNSA.3
• FPSA.1 - PPSA.1 / total molecular surface area
• FPSA.2 - PPSA.2 / total molecular surface area
• FPSA.3 - PPSA.3 / total molecular surface area
• FNSA.1 - PNSA.1 / total molecular surface area
• FNSA.2 - PNSA.2 / total molecular surface area
• FNSA.3 - PNSA.3 / total molecular surface area
• WPSA.1 - PPSA.1 * total molecular surface area / 1000
• WPSA.2 - PPSA.2 * total molecular surface area /1000
• WPSA.3 - PPSA.3 * total molecular surface area / 1000
• WNSA.1 - PNSA.1 * total molecular surface area /1000
• WNSA.2 - PNSA.2 * total molecular surface area / 1000
• WNSA.3 - PNSA.3 * total molecular surface area / 1000
• RPCG - relative positive charge – most positive charge / total positive charge
• RNCG - relative negative charge – most negative charge / total negative charge
• RPCS - relative positive charge surface area – most positive surface area * RPCG
• RNCS - relative negative charge surface area – most negative surface area * RNCG
• THSA - sum of solvent accessible surface areas of atoms with absolute value of partial charges less than 0.2
• TPSA - sum of solvent accessible surface areas of atoms with absolute value of partial charges greater than or equal 0.2
• RHSA - THSA / total molecular surface area
• RPSA - TPSA / total molecular surface area
**extractDrugDescOB**

**Author(s)**

Nan Xiao [http://nanx.me](http://nanx.me)

**extractDrugDescOB**  
*Calculate Molecular Descriptors Provided by OpenBabel*

**Description**

Calculate Molecular Descriptors Provided by OpenBabel

**Usage**

```r
extractDrugDescOB(molecules, type = c("smile", "sdf"))
```

**Arguments**

- `molecules` R character string object containing the molecules. See the example section for details.
- `type` 'smile' or 'sdf'.

**Details**

This function calculates 14 types of the *numerical* molecular descriptors provided in OpenBabel.

**Value**

A data frame, each row represents one of the molecules, each column represents one descriptor. This function returns 14 columns named `abonds`, `atoms`, `bonds`, `dbonds`, `HBA1`, `HBA2`, `HBD`, `logP`, `MR`, `MW`, `nF`, `sbonds`, `tbonds`, `TPSA`:

- `abonds` - Number of aromatic bonds
- `atoms` - Number of atoms
- `bonds` - Number of bonds
- `dbonds` - Number of double bonds
- `HBA1` - Number of Hydrogen Bond Acceptors 1
- `HBA2` - Number of Hydrogen Bond Acceptors 2
extractDrugECI

Calculates the Eccentric Connectivity Index Descriptor

Description

Calculates the Eccentric Connectivity Index Descriptor

Usage

extractDrugECI(molecules, silent = TRUE)

Arguments

molecules  Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.
Details

Eccentric Connectivity Index (ECI) is a topological descriptor combining distance and adjacency information. This descriptor is described by Sharma et al. and has been shown to correlate well with a number of physical properties. The descriptor is also reported to have good discriminatory ability. The eccentric connectivity index for a hydrogen suppressed molecular graph is given by

\[
x_i^c = \sum_{i=1}^{n} E(i)V(i)
\]

where \(E(i)\) is the eccentricity of the \(i\)-th atom (path length from the \(i\)-th atom to the atom farthest from it) and \(V(i)\) is the vertex degree of the \(i\)-th atom.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named ECCEN.

extractDrugEstate

Calculate the E-State Molecular Fingerprints (in Compact Format)

Description

Calculate the E-State Molecular Fingerprints (in Compact Format)

Usage

```
extractDrugEstate(molecules, silent = TRUE)
```

Arguments

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.
extractDrugEstateComplete

Details

79 bit fingerprints corresponding to the E-State atom types described by Hall and Kier.

Value

A list, each component represents one of the molecules, each element in the component represents the index of which element in the fingerprint is 1. Each component’s name is the length of the fingerprints.

Author(s)

Nan Xiao <http://nanx.me>

```

---

**extractDrugExtended**  *Calculate the Extended Molecular Fingerprints (in Compact Format)*

**Description**

Calculate the Extended Molecular Fingerprints (in Compact Format)

**Usage**

```
extractDrugExtended(molecules, depth = 6, size = 1024, silent = TRUE)
```

**Arguments**

- `molecules`  Parsed molecule object.
- `depth`  The search depth. Default is 6.
- `size`  The length of the fingerprint bit string. Default is 1024.
- `silent`  Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

Calculate the extended molecular fingerprints. Considers paths of a given length, similar to the standard type, but takes rings and atomic properties into account into account. This is hashed fingerprints, with a default length of 1024.

**Value**

A list, each component represents one of the molecules, each element in the component represents the index of which element in the fingerprint is 1. Each component's name is the length of the fingerprints.

**extractDrugFMF**

*Calculates the FMF Descriptor*

**Examples**

```r
smi = system.file('vignettes/FDA0DD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
fp = extractDrugExtendedComplete(mol)
dim(fp)
```

**Description**

Calculates the FMF Descriptor

**Usage**

```r
extractDrugFMF(molecules, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is `TRUE`.

**Details**

Calculates the FMF descriptor characterizing molecular complexity in terms of its Murcko framework. This descriptor is the ratio of heavy atoms in the framework to the total number of heavy atoms in the molecule. By definition, acyclic molecules which have no frameworks, will have a value of 0. Note that the authors consider an isolated ring system to be a framework (even though there is no linker).

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named `FMF`.

**Author(s)**

Nan Xiao [http://nanx.me](http://nanx.me)

**References**

**Examples**

```r
smi = system.file('vignettes/FDA0DD.smi', package = 'Rcpi')

dat = extractDrugFMF(mol)
head(dat)
```
extractDrugFragmentComplexity

*Calculate Complexity of a System*

**Description**

Calculate Complexity of a System

**Usage**

```r
extractDrugFragmentComplexity(molecules, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

This descriptor calculates the complexity of a system. The complexity is defined in Nilakantan, R. et al. as:

\[
    C = \text{abs}(B^2 - A^2 + A) + \frac{H}{100}
\]

where C is complexity, A is the number of non-hydrogen atoms, B is the number of bonds and H is the number of heteroatoms.

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named `fragC`.

**Author(s)**

Nan Xiao <http://nanx.me>

**References**

**Examples**

head(dat)
```
**extractDrugGraph**

*Calculate the Graph Molecular Fingerprints (in Compact Format)*

**Description**

Calculate the Graph Molecular Fingerprints (in Compact Format)

**Usage**

```r
extractDrugGraph(molecules, depth = 6, size = 1024, silent = TRUE)
```

**Arguments**

- `molecules` Parsed molecule object.
- `depth` The search depth. Default is 6.
- `size` The length of the fingerprint bit string. Default is 1024.
- `silent` Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

Calculate the graph molecular fingerprints. Similar to the standard type by simply considers connectivity. This is hashed fingerprints, with a default length of 1024.

**Value**

A list, each component represents one of the molecules, each element in the component represents the index of which element in the fingerprint is 1. Each component's name is the length of the fingerprints.

dim(fp)
```
**extractDrugGravitationalIndex**

*Descriptor Characterizing the Mass Distribution of the Molecule.*

**Description**

Descriptor characterizing the mass distribution of the molecule described by Katritzky et al. For modelling purposes the value of the descriptor is calculated both with and without H atoms. Furthermore the square and cube roots of the descriptor are also generated as described by Wessel et al.

**Usage**

```r
evaluateDrugGravitationalIndex(molecules, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is `TRUE`.

**Details**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 9 columns:

- `GRAV.1`: Gravitational index of heavy atoms
- `GRAV.2`: Square root of gravitational index of heavy atoms
- `GRAV.3`: Cube root of gravitational index of heavy atoms
- `GRAVH.1`: Gravitational index - hydrogens included
- `GRAVH.2`: Square root of hydrogen-included gravitational index
- `GRAVH.3`: Cube root of hydrogen-included gravitational index
- `GRAV.4`: Grav1 for all pairs of atoms (not just bonded pairs)
- `GRAV.5`: Grav2 for all pairs of atoms (not just bonded pairs)
- `GRAV.6`: Grav3 for all pairs of atoms (not just bonded pairs)

extractDrugHBondAcceptorCount

Descriptor that Calculates the Number of Hydrogen Bond Acceptors

Description

Descriptor that Calculates the Number of Hydrogen Bond Acceptors

Usage

extractDrugHBondAcceptorCount(molecules, silent = TRUE)

Arguments

molecules  Parsed molecule object.
silent  Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

This descriptor calculates the number of hydrogen bond acceptors using a slightly simplified version of the PHACIR atom types. The following groups are counted as hydrogen bond acceptors: any oxygen where the formal charge of the oxygen is non-positive (i.e. formal charge <= 0) except

1. an aromatic ether oxygen (i.e. an ether oxygen that is adjacent to at least one aromatic carbon)
2. an oxygen that is adjacent to a nitrogen

and any nitrogen where the formal charge of the nitrogen is non-positive (i.e. formal charge <= 0) except a nitrogen that is adjacent to an oxygen.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named nHBAcc.
extractDrugHBondDonorCount

Author(s)

Nan Xiao <http://nanx.me>

Examples

```r
smi = system.file('vignetteData/FDAMDD.smi', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugHBondDonorCount(mol)
head(dat)
```

extractDrugHBondDonorCount

*Descriptor that Calculates the Number of Hydrogen Bond Donors*

Description

Descriptor that Calculates the Number of Hydrogen Bond Donors

Usage

```r
extractDrugHBondDonorCount(molecules, silent = TRUE)
```

Arguments

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is `TRUE`.

Details

This descriptor calculates the number of hydrogen bond donors using a slightly simplified version of the PHACIR atom types (http://www.chemie.uni-erlangen.de/model2001/abstracts/rester.html). The following groups are counted as hydrogen bond donors:

- Any-OH where the formal charge of the oxygen is non-negative (i.e. formal charge >= 0)
- Any-NH where the formal charge of the nitrogen is non-negative (i.e. formal charge >= 0)

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named `nHBDon`.

Author(s)

Nan Xiao <http://nanx.me>

Examples

```r
smi = system.file('vignetteData/FDAMDD.smi', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugHBondDonorCount(mol)
head(dat)
```
extractDrugHybridization

**Description**

Calculate the Hybridization Molecular Fingerprints (in Compact Format)

**Usage**

```r
extractDrugHybridization(molecules, depth = 6, size = 1024, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `depth`: The search depth. Default is 6.
- `size`: The length of the fingerprint bit string. Default is 1024.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

Calculate the hybridization molecular fingerprints. Similar to the standard type, but only consider hybridization state. This is hashed fingerprints, with a default length of 1024.

**Value**

A list, each component represents one of the molecules, each element in the component represents the index of which element in the fingerprint is 1. Each component’s name is the length of the fingerprints.

**Author(s)**

Nan Xiao <http://nanx.me>

**See Also**

- `extractDrugHybridizationComplete`

**Examples**

```r
smi = system.file('vignettes/FDEMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
fp = extractDrugHybridization(mol)
head(fp)
```
extractDrugHybridizationComplete

Calculate the Hybridization Molecular Fingerprints (in Complete Format)

Description

Calculate the Hybridization Molecular Fingerprints (in Complete Format)

Usage

extractDrugHybridizationComplete(molecules, depth = 6, size = 1024,
silent = TRUE)

Arguments

molecules  Parsed molecule object.
depth     The search depth. Default is 6.
size      The length of the fingerprint bit string. Default is 1024.
silent    Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Calculate the hybridization molecular fingerprints. Similar to the standard type, but only consider hybridization state. This is hashed fingerprints, with a default length of 1024.

Value

An integer vector or a matrix. Each row represents one molecule, the columns represent the fingerprints.

mol = readMolFromSmi(smi, type = 'mol')
fp  = extractDrugHybridizationComplete(mol)
dim(fp)
extractDrugHybridizationRatio

Descriptor that Characterizing Molecular Complexity in Terms of Carbon Hybridization States

Description

Descriptor that Characterizing Molecular Complexity in Terms of Carbon Hybridization States

Usage

extractDrugHybridizationRatio(molecules, silent = TRUE)

Arguments

- molecules: Parsed molecule object.
- silent: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

This descriptor calculates the fraction of sp3 carbons to sp2 carbons. Note that it only considers carbon atoms and rather than use a simple ratio it reports the value of Nsp3/(Nsp3 + Nsp2). The original form of the descriptor (i.e., simple ratio) has been used to characterize molecular complexity, especially in the are of natural products, which usually have a high value of the sp3 to sp2 ratio.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named HybRatio.

Author(s)

Nan Xiao <http://nanx.me>

Examples

```r
smi = system.file('vignette/data/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugHybridizationRatio(mol)
head(dat)
```
**extractDrugIPMolecularLearning**

*Calculates the Descriptor that Evaluates the Ionization Potential*

**Description**

Calculates the Descriptor that Evaluates the Ionization Potential

**Usage**

```r
evaluateDrugIPMolecularLearning(molecules, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is `TRUE`.

**Details**

Calculate the ionization potential of a molecule. The descriptor assumes that explicit hydrogens have been added to the molecules.

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named `MolIP`.

**Author(s)**

Nan Xiao <http://nanx.me>

**Examples**

```r
smi = system.file('vignettes/Rd/extractDrugIPMolecularLearning.Rd', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')

dat = extractDrugIPMolecularLearning(mol)

head(dat)
```

---

**extractDrugKappaShapeIndices**

*Descriptor that Calculates Kier and Hall Kappa Molecular Shape Indices*

**Description**

Descriptor that Calculates Kier and Hall Kappa Molecular Shape Indices
Usage

extractDrugKappaShapeIndices(molecules, silent = TRUE)

Arguments

molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Kier and Hall Kappa molecular shape indices compare the molecular graph with minimal and maximal molecular graphs; see http://www.chemcomp.com/Journal_of_CCG/Features/descr.htm#KH for details: "they are intended to capture different aspects of molecular shape. Note that hydrogens are ignored. In the following description, n denotes the number of atoms in the hydrogen suppressed graph, m is the number of bonds in the hydrogen suppressed graph. Also, let p2 denote the number of paths of length 2 and let p3 denote the number of paths of length 3".

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 3 columns named Kier1, Kier2 and Kier3:

• Kier1 - First kappa shape index
• Kier2 - Second kappa shape index
• Kier3 - Third kappa shape index

Examples

smi = system.file(path='vignettes/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugKappaShapeIndices(mol)
head(dat)

extractDrugKierHallSmarts

Descriptor that Counts the Number of Occurrences of the E-State Fragments

Description

Descriptor that Counts the Number of Occurrences of the E-State Fragments

Usage

extractDrugKierHallSmarts(molecules, silent = TRUE)
Arguments

- **molecules**: Parsed molecule object.
- **silent**: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

A fragment count descriptor that uses e-state fragments. Traditionally the e-state descriptors identify the relevant fragments and then evaluate the actual e-state value. However it has been shown in Butina et al. that simply using the counts of the e-state fragments can lead to QSAR models that exhibit similar performance to those built using the actual e-state indices.

Atom typing and aromaticity perception should be performed prior to calling this descriptor. The atom type definitions are taken from Hall et al. The SMARTS definitions were obtained from RDKit.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 79 columns:

**extractDrugKR**

*Calculate the KR (Klekota and Roth) Molecular Fingerprints (in Compact Format)*

**Description**

Calculate the KR (Klekota and Roth) Molecular Fingerprints (in Compact Format)

**Usage**

```r
extractDrugKR(molecules, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

Calculate the 4860 bit fingerprint defined by Klekota and Roth.

**Value**

A list, each component represents one of the molecules, each element in the component represents the index of which element in the fingerprint is 1. Each component’s name is the length of the fingerprints.

**Author(s)**

Nan Xiao <http://nanx.me>

**See Also**

head(fp)
```

### extractDrugKRComplete

*Calculate the KR (Klekota and Roth) Molecular Fingerprints (in Complete Format)*

## Description

Calculate the KR (Klekota and Roth) Molecular Fingerprints (in Complete Format)

## Usage

```r
extractDrugKRComplete(molecules, silent = TRUE)
```

## Arguments

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is `TRUE`.

## Details

Calculate the 4860 bit fingerprint defined by Klekota and Roth.

## Value

An integer vector or a matrix. Each row represents one molecule, the columns represent the fingerprints.

## Author(s)

Nan Xiao <http://nanx.me>

## See Also

dim(fp)
```
extractDrugLargestChain

Descriptor that Calculates the Number of Atoms in the Largest Chain

Description

Descriptor that Calculates the Number of Atoms in the Largest Chain

Usage

extractDrugLargestChain(molecules, silent = TRUE)

Arguments

molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

This descriptor calculates the number of atoms in the largest chain. Note that a chain exists if there are two or more atoms. Thus single atom molecules will return 0.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named nAtomLC.

Author(s)

Nan Xiao <http://nanx.me>

Examples

smi = system.file('vignettedata/FDAMDD.smi', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugLargestChain(mol)
head(dat)

extractDrugLargestPiSystem

Descriptor that Calculates the Number of Atoms in the Largest Pi Chain

Description

Descriptor that Calculates the Number of Atoms in the Largest Pi Chain
extractDrugLargestPiSystem

Usage

```
extractDrugLargestPiSystem(molecules, silent = TRUE)
```

Arguments

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

This descriptor calculates the number of atoms in the largest pi chain.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named `nAtomP`.

Author(s)

Nan Xiao <http://nanx.me>

Examples

```
smi = system.file('vignetteData/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugLargestPiSystem(mol)
head(dat)
```

---

extractDrugLengthOverBreadth

*Calculates the Ratio of Length to Breadth Descriptor*

Description

Calculates the Ratio of Length to Breadth Descriptor

Usage

```
extractDrugLengthOverBreadth(molecules, silent = TRUE)
```

Arguments

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Calculates the Ratio of Length to Breadth, as a result it does not perform any orientation and only considers the X & Y extents for a series of rotations about the Z axis (in 10 degree increments).
**extractDrugLongestAliphaticChain**

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns two columns named LOBMAX and LOBMIN:

- LOBMAX - The maximum L/B ratio;
- LOBMIN - The L/B ratio for the rotation that results in the minimum area (defined by the product of the X & Y extents for that orientation).

**Note**

The descriptor assumes that the atoms have been configured.

**Author(s)**

Nan Xiao <http://nanx.me>

**Examples**

```r
sdf = system.file('sysdata/OptAA3d.sdf', package = 'Rcpl')

mol = readMolFromSDF(sdf)
dat = extractDrugLengthOverBreadth(mol)
head(dat)
```

---

**extractDrugLongestAliphaticChain**

Descriptor that Calculates the Number of Atoms in the Longest Aliphatic Chain

**Description**

Descriptor that Calculates the Number of Atoms in the Longest Aliphatic Chain

**Usage**

```r
extractDrugLongestAliphaticChain(molecules, silent = TRUE)
```

**Arguments**

- `molecules` Parsed molecule object.
- `silent` Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

This descriptor calculates the number of atoms in the longest aliphatic chain.

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named nAtomLAC.
**extractDrugMACCS**

*Calculate the MACCS Molecular Fingerprints (in Compact Format)*

**Description**

Calculate the MACCS Molecular Fingerprints (in Compact Format)

**Usage**

```r
extractDrugMACCS(molecules, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

The popular 166 bit MACCS keys described by MDL.

**Value**

A list, each component represents one of the molecules, each element in the component represents the index of which element in the fingerprint is 1. Each component's name is the length of the fingerprints.

**Author(s)**

Nan Xiao [http://nanx.me](http://nanx.me)

head(dat)

fp = extractDrugMACCS(mol)

head(fp)
```
extractDrugMACCSComplete

*Calculate the MACCS Molecular Fingerprints (in Complete Format)*

**Description**

Calculate the MACCS Molecular Fingerprints (in Complete Format)

**Usage**

```r
extractDrugMACCSComplete(molecules, silent = TRUE)
```

**Arguments**

- `molecules` Parsed molecule object.
- `silent` Logical. Whether the calculating process should be shown or not, default is `TRUE`.

**Details**

The popular 166 bit MACCS keys described by MDL.

**Value**

An integer vector or a matrix. Each row represents one molecule, the columns represent the fingerprints.

**Author(s)**

Nan Xiao &lt;[http://nanx.me](http://nanx.me)&gt;

**See Also**

`extractDrugMACCS`

**Examples**

```r
smi = system.file('vignettes/Rcpp/FDAMDD.smi', package = 'Rcpp')

mol = readMolFromSmi(smi, type = 'mol')

fp = extractDrugMACCSComplete(mol)

dim(fp)
```
extractDrugMannholdLogP

Descriptor that Calculates the LogP Based on a Simple Equation Using the Number of Carbons and Hetero Atoms

Description

Descriptor that Calculates the LogP Based on a Simple Equation Using the Number of Carbons and Hetero Atoms

Usage

extractDrugMannholdLogP(molecules, silent = TRUE)

Arguments

molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

This descriptor calculates the LogP based on a simple equation using the number of carbons and hetero atoms. The implemented equation was proposed in Mannhold et al.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named MLogP.

Author(s)

Nan Xiao <http://nanx.me>

References

Examples

smi = system.file('vignettes/FOAMDD.smi', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugMannholdLogP(mol)
head(dat)
extractDrugMDE

Calculate Molecular Distance Edge (MDE) Descriptors for C, N and O

Description

Calculate Molecular Distance Edge (MDE) Descriptors for C, N and O

Usage

extractDrugMDE(molecules, silent = TRUE)

Arguments

molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

This descriptor calculates the 10 molecular distance edge (MDE) descriptor described in Liu, S., Cao, C., & Li, Z, and in addition it calculates variants where O and N are considered.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named nAtomLAC.

Author(s)

Nan Xiao <http://nanx.me>

References

Examples

smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')

dat = extractDrugMDE(mol)
head(dat)
extractDrugMomentOfInertia

**Descriptor that Calculates the Principal Moments of Inertia and Ratios of the Principal Moments**

**Description**

Descriptor that Calculates the Principal Moments of Inertia and Ratios of the Principal Moments

**Usage**

extractDrugMomentOfInertia(molecules, silent = TRUE)

**Arguments**

- **molecules**: Parsed molecule object.
- **silent**: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

A descriptor that calculates the moment of inertia and radius of gyration. Moment of inertia (MI) values characterize the mass distribution of a molecule. Related to the MI values, ratios of the MI values along the three principal axes are also well know modeling variables. This descriptor calculates the MI values along the X, Y and Z axes as well as the ratio’s X/Y, X/Z and Y/Z. Finally it also calculates the radius of gyration of the molecule.

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 7 columns named MOMI.X, MOMI.Y, MOMI.Z, MOMI.XY, MOMI.XZ, MOMI.YZ, MOMI.R:

- MOMI.X - MI along X axis
- MOMI.Y - MI along Y axis
- MOMI.Z - MI along Z axis
- MOMI.XY - X/Y
- MOMI.XZ - X/Z
- MOMI.YZ - Y/Z
- MOMI.R - Radius of gyration

One important aspect of the algorithm is that if the eigenvalues of the MI tensor are below 1e-3, then the ratio’s are set to a default of 1000.

**Author(s)**

Nan Xiao <http://nanx.me>
**Examples**

```r
sdf = system.file('sysdata/OptAA3d.sdf', package = 'Rcpi')

mol = readMolFromSDF(sdf)
dat = extractDrugMomentOfInertia(mol)
head(dat)
```

---

**extractDrugOBFP2**

*Calculate the FP2 Molecular Fingerprints*

**Description**

Calculate the FP2 Molecular Fingerprints

**Usage**

```r
extractDrugOBFP2(molecules, type = c("smile", "sdf"))
```

**Arguments**

- `molecules`: R character string object containing the molecules. See the example section for details.
- `type`: 'smile' or 'sdf'.

**Details**

Calculate the 1024 bit FP2 fingerprints provided by OpenBabel.

**Value**

A matrix. Each row represents one molecule, the columns represent the fingerprints.

**Author(s)**

Nan Xiao <http://nanx.me>

**Examples**

```r
mol1 = 'C1CCC1CC(CN(C)(C))CC=N0)CC'  # one molecule SMILE in a vector
mol2 = c('CCC', 'CCN', 'CCN(C)(C)', 'cccccccc1cc1ccccc1',
        'C1CCC1CC(CN(C)(C))CC=N0)CC')  # multiple SMILES in a vector
mol3 = readChar(system.file('comseq/DB00860.sdf', package = 'Rcpi'),
                 nchars = 1e+6)  # single molecule in a sdf file
mol4 = readChar(system.file('sysdata/OptAA3d.sdf', package = 'Rcpi'),
                 nchars = 1e+6)  # multiple molecules in a sdf file

smifp0 = extractDrugOBFP2(mol1, type = 'smile')
smifp1 = extractDrugOBFP2(mol2, type = 'smile')
sdffp0 = extractDrugOBFP2(mol3, type = 'sdf')
sdffp1 = extractDrugOBFP2(mol4, type = 'sdf')
```
extractDrugOBFP3  Calculate the FP3 Molecular Fingerprints

Description

Calculate the FP3 Molecular Fingerprints

Usage

extractDrugOBFP3(molecules, type = c("smile", "sdf"))

Arguments

molecules  R character string object containing the molecules. See the example section for details.

type  'smile' or 'sdf'.

Details

Calculate the 64 bit FP3 fingerprints provided by OpenBabel.

Value

A matrix. Each row represents one molecule, the columns represent the fingerprints.

Author(s)

Nan Xiao <http://nanx.me>

Examples

mol1 = 'C1CCC1CC(CN(C)(C))CC(=O)CC' # one molecule SMILE in a vector
mol2 = c('CCC', 'CCN', 'CCN(C)(C)', 'c1cccc1Cc1cccc1', 'ClCC1CC(CN(C)(C))CC(=O)CC')  # multiple SMILEs in a vector
mol3 = readChar(system.file('compseq/DB00860.sdf', package = 'Rcpi'), nchars = 1e+6) # single molecule in a sdf file
mol4 = readChar(system.file('sysdata/OptAA3d.sdf', package = 'Rcpi'), nchars = 1e+6) # multiple molecules in a sdf file

smifp0 = extractDrugOBFP3(mol1, type = 'smile')
smifp1 = extractDrugOBFP3(mol2, type = 'smile')
sdffp0 = extractDrugOBFP3(mol3, type = 'sdf')
sdffp1 = extractDrugOBFP3(mol4, type = 'sdf')
**extractDrugOBFP4**

*Calculate the FP4 Molecular Fingerprints*

**Description**

Calculate the FP4 Molecular Fingerprints

**Usage**

```r
evaluateDrugOBFP4(molecules, type = c("smile", "sdf"))
```

**Arguments**

- `molecules`: R character string object containing the molecules. See the example section for details.
- `type`: 'smile' or 'sdf'.

**Details**

Calculate the 512 bit FP4 fingerprints provided by OpenBabel.

**Value**

A matrix. Each row represents one molecule, the columns represent the fingerprints.

**Author(s)**

Nan Xiao [http://nanx.me](http://nanx.me)

**Examples**

```r
mol1 = 'C1CCCCC(C(N(C)(C))CC(=O)CC' # one molecule SMILE in a vector
mol2 = c('CCC', 'CCN', 'CCN(C)(C)', c('CCCCCCCCCCCCCCCCC',
     'CCCCCCCCCCCCCCCCC(=O)CC') # multiple SMILEs in a vector
mol3 = readChar(system.file('compseq/DB00860.sdf', package = 'Rcpi'),
     nchars = 1e+6) # single molecule in a sdf file
mol4 = readChar(system.file('sysdata/OptAA3d.sdf', package = 'Rcpi'),
     nchars = 1e+6) # multiple molecules in a sdf file

smifp0 = evaluateDrugOBFP4(mol1, type = 'smile')
smifp1 = evaluateDrugOBFP4(mol2, type = 'smile')
sdffp0 = evaluateDrugOBFP4(mol3, type = 'sdf')
sdffp1 = evaluateDrugOBFP4(mol4, type = 'sdf')
```
**extractDrugOBMACCS**  
*Calculate the MACCS Molecular Fingerprints*

**Description**

Calculate the MACCS Molecular Fingerprints

**Usage**

```r
extractDrugOBMACCS(molecules, type = c("smile", "sdf"))
```

**Arguments**

- `molecules` R character string object containing the molecules. See the example section for details.
- `type` 'smile' or 'sdf'.

**Details**

Calculate the 256 bit MACCS fingerprints provided by OpenBabel.

**Value**

A matrix. Each row represents one molecule, the columns represent the fingerprints.

**Author(s)**

Nan Xiao [http://nanx.me](http://nanx.me)

**Examples**

```r
mol1 = 'C1CCC1CC(CN(C)(C)CC(=O)CC'  # one molecule SMILE in a vector
mol2 = c('CCC', 'CCN', 'CCN(C)(C)', 'c1ccccc1Cc1ccccc1',
         'C1CCC1CC(CN(C)(C)CC(=O)CC')  # multiple SMILES in a vector
mol3 = readChar(system.file('compseq/DB00860.sdf', package = 'Rcpi'),
                 nchars = 1e+6)  # single molecule in a sdf file
mol4 = readChar(system.file('sysdata/OptAA3d.sdf', package = 'Rcpi'),
                 nchars = 1e+6)  # multiple molecules in a sdf file

# MACCS may not be available in current version of ChemmineOB
smifp0 = extractDrugOBMACCS(mol1, type = 'smile')
smifp1 = extractDrugOBMACCS(mol2, type = 'smile')
sdffp0 = extractDrugOBMACCS(mol3, type = 'sdf')
sdffp1 = extractDrugOBMACCS(mol4, type = 'sdf')
```
Descriptor that Calculates the Petitjean Number of a Molecule

Usage

extractDrugPetitjeanNumber(molecules, silent = TRUE)

Arguments

molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

This descriptor calculates the Petitjean number of a molecule. According to the Petitjean definition, the eccentricity of a vertex corresponds to the distance from that vertex to the most remote vertex in the graph.

The distance is obtained from the distance matrix as the count of edges between the two vertices. If $r(i)$ is the largest matrix entry in row $i$ of the distance matrix $D$, then the radius is defined as the smallest of the $r(i)$. The graph diameter $D$ is defined as the largest vertex eccentricity in the graph.

(http://www.edusoft-1c.com/molconn/manuals/400/chaptwo.html)

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named PetitjeanNumber.

Author(s)

Nan Xiao <http://nanx.me>

Examples

smi = system.file('vignetteData/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugPetitjeanNumber(mol)
head(dat)
extractDrugPetitjeanShapeIndex

Descriptor that Calculates the Petitjean Shape Indices

Usage

extractDrugPetitjeanShapeIndex(molecules, silent = TRUE)

Arguments

molecules  Parsed molecule object.
silent     Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

The topological and geometric shape indices described Petitjean and Bath et al. respectively. Both measure the anisotropy in a molecule.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns two columns named topoShape (Topological Shape Index) and geomShape (Geometric Shape Index).

Author(s)

Nan Xiao <http://nanx.me>

Examples

sdf = system.file('sysdata/OptAA3d.sdf', package = 'Rcpp')

mol = readMolFromSDF(sdf)

dat = extractDrugPetitjeanShapeIndex(mol)

head(dat)
**extractDrugPubChem**

*Calculate the PubChem Molecular Fingerprints (in Compact Format)*

**Description**

Calculate the PubChem Molecular Fingerprints (in Compact Format)

**Usage**

```r
ejectDrugPubChem(molecules, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

Calculate the 881 bit fingerprints defined by PubChem.

**Value**

A list, each component represents one of the molecules, each element in the component represents the index of which element in the fingerprint is 1. Each component’s name is the length of the fingerprints.

**Author(s)**

Nan Xiao &lt;http://nanx.me&gt;

**See Also**

- `extractDrugPubChemComplete`

**Examples**

```r
smi = system.file('vignettes/Rcpi/FDAMDD.smi', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')

fp = extractDrugPubChem(mol)

head(fp)
```
extractDrugPubChemComplete

*Calculate the PubChem Molecular Fingerprints (in Complete Format)*

**Description**

Calculate the PubChem Molecular Fingerprints (in Complete Format)

**Usage**

```r
extractDrugPubChemComplete(molecules, silent = TRUE)
```

**Arguments**

- `molecules` Parsed molecule object.
- `silent` Logical. Whether the calculating process should be shown or not, default is `TRUE`.

**Details**

Calculate the 881 bit fingerprints defined by PubChem.

**Value**

An integer vector or a matrix. Each row represents one molecule, the columns represent the fingerprints.

**Author(s)**

Nan Xiao [http://nanx.me](http://nanx.me)

**See Also**

- `extractDrugPubChem`

**Examples**

```r
smi = system.file('vignettes/R-calcdESI-MS.sm', package = 'RcalcdESI-MS')
mol = readMolFromSmi(smi, type = 'mol')

```

```r
dim(fp)
```
extractDrugRotatableBondsCount

**Descriptor that Calculates the Number of Nonrotatable Bonds on A Molecule**

**Description**

Descriptor that Calculates the Number of Nonrotatable Bonds on A Molecule

**Usage**

```
extractDrugRotatableBondsCount(molecules, silent = TRUE)
```

**Arguments**

- **molecules**: Parsed molecule object.
- **silent**: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

The number of rotatable bonds is given by the SMARTS specified by Daylight on SMARTS tutorial ([http://www.daylight.com/dayhtml_tutorials/languages/smarts/smarts_examples.html#EXMPL](http://www.daylight.com/dayhtml_tutorials/languages/smarts/smarts_examples.html#EXMPL))

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named nRotB.

**Author(s)**

Nan Xiao <http://nanx.me>

**Examples**

```
smi = system.file('vignettes/FOAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugRotatableBondsCount(mol)
head(dat)
```
extractDrugRuleOfFive

Descriptor that Calculates the Number Failures of the Lipinski's Rule Of Five

Usage

extractDrugRuleOfFive(molecules, silent = TRUE)

Arguments

molecules
Parsed molecule object.
silent
Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

This descriptor calculates the number failures of the Lipinski’s Rule Of Five: http://en.wikipedia.org/wiki/Lipinski’s_Rule_of_Five.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named LipinskiFailures.

Author(s)

Nan Xiao <http://nanx.me>

Examples

smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugRuleOfFive(mol)
head(dat)

extractDrugShortestPath

Calculate the Shortest Path Molecular Fingerprints (in Compact Format)

Description

Calculate the Shortest Path Molecular Fingerprints (in Compact Format)
extractDrugShortestPathComplete

Usage

extractDrugShortestPathComplete(molecules, depth = 6, size = 1024, silent = TRUE)

Arguments

molecules Parsed molecule object.
depth The search depth. Default is 6.
size The length of the fingerprint bit string. Default is 1024.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Calculate the fingerprint based on the shortest paths between pairs of atoms and takes into account ring systems, charges etc.

Value

A list, each component represents one of the molecules, each element in the component represents the index of which element in the fingerprint is 1. Each component's name is the length of the fingerprints.

Author(s)

Nan Xiao <http://nanx.me>

See Also

Examples

smi = system.file('vignetteData/VDADDD.smi', package = 'Rcpp')
mol = readMolFromSmi(smi, type = 'mol')
fp = extractDrugShortestPath(mol)
head(fp)

desc = extractDrugShortestPathComplete

Description

Calculate the Shortest Path Molecular Fingerprints (in Complete Format)

Usage

extractDrugShortestPathComplete(molecules, depth = 6, size = 1024, silent = TRUE)
Arguments

molecules  Parsed molecule object.
depth     The search depth. Default is 6.
size      The length of the fingerprint bit string. Default is 1024.
silent    Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Calculate the fingerprint based on the shortest paths between pairs of atoms and takes into account ring systems, charges etc.

Value

An integer vector or a matrix. Each row represents one molecule, the columns represent the fingerprints.

Author(s)

Nan Xiao <http://nanx.me>

```

extractDrugStandard  Calculate the Standard Molecular Fingerprints (in Compact Format)

Description

Calculate the Standard Molecular Fingerprints (in Compact Format)

Usage

```r
extractDrugStandard(molecules, depth = 6, size = 1024, silent = TRUE)
```

Arguments

molecules  Parsed molecule object.
depth     The search depth. Default is 6.
size      The length of the fingerprint bit string. Default is 1024.
silent    Logical. Whether the calculating process should be shown or not, default is TRUE.
extractDrugStandardComplete

Details

Calculate the standard molecular fingerprints. Considers paths of a given length. This is hashed fingerprints, with a default length of 1024.

Value

A list, each component represents one of the molecules, each element in the component represents the index of which element in the fingerprint is 1. Each component's name is the length of the fingerprints.

Author(s)

Nan Xiao <http://nanx.me>

extractDrugStandardComplete

*Calculate the Standard Molecular Fingerprints (in Complete Format)*

Description

Calculate the Standard Molecular Fingerprints (in Complete Format)

Usage

```r
extractDrugStandardComplete(molecules, depth = 6, size = 1024, silent = TRUE)
```

Arguments

- `molecules`: Parsed molecule object.
- `depth`: The search depth. Default is 6.
- `size`: The length of the fingerprint bit string. Default is 1024.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Calculate the standard molecular fingerprints. Considers paths of a given length. This is hashed fingerprints, with a default length of 1024.
Value

An integer vector or a matrix. Each row represents one molecule, the columns represent the fingerprints.

```

---

**extractDrugTPSA**  
Descriptor of Topological Polar Surface Area Based on Fragment Contributions (TPSA)

Description

Descriptor of Topological Polar Surface Area Based on Fragment Contributions (TPSA)

Usage

```r
extractDrugTPSA(molecules, silent = TRUE)
```

Arguments

- **molecules**: Parsed molecule object.
- **silent**: Logical. Whether the calculating process should be shown or not, default is TRUE.

Details

Calculate the descriptor of topological polar surface area based on fragment contributions (TPSA).

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named TopoPSA.

Author(s)

Nan Xiao <http://nanx.me>
**extractDrugVABC**

**References**

**Examples**

```r
smi = system.file('vignetteData/FDAMDD.smi', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugVABC(mol)
head(dat)
```

---

**extractDrugVABC**  
*Descriptor that Calculates the Volume of A Molecule*

**Description**

Descriptor that Calculates the Volume of A Molecule

**Usage**

```r
extractDrugVABC(molecules, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

This descriptor calculates the volume of a molecule.

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named VABC.

**Author(s)**

Nan Xiao <http://nanx.me>

**Examples**

```r
smi = system.file('vignetteData/FDAMDD.smi', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugVABC(mol)
head(dat)
```
---

**extractDrugVAdjMa**  
*Descriptor that Calculates the Vertex Adjacency Information of A Molecule*

**Description**  
Descriptor that Calculates the Vertex Adjacency Information of A Molecule

**Usage**  
```r
extractDrugVAdjMa(molecules, silent = TRUE)
```

**Arguments**
- **molecules**: Parsed molucule object.  
- **silent**: Logical. Whether the calculating process should be shown or not, default is `TRUE`.  

**Details**  
Vertex adjacency information (magnitude):  
\[ 1 + \log_2 m \]  
where \( m \) is the number of heavy-heavy bonds. If \( m \) is zero, then 0 is returned.

**Value**  
A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named `VAdjMat`.

**Author(s)**  
Nan Xiao &lt;[http://nanx.me](http://nanx.me)&gt;

**Examples**
```r
smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugVAdjMa(mol)
head(dat)
```

---

**extractDrugWeight**  
*Descriptor that Calculates the Total Weight of Atoms*

**Description**  
Descriptor that Calculates the Total Weight of Atoms

**Usage**  
```r
extractDrugWeight(molecules, silent = TRUE)
```
extractDrugWeightedPath

**Arguments**

- `molecules` Parsed molecule object.
- `silent` Logical. Whether the calculating process should be shown or not, default is `TRUE`.

**Details**

This descriptor calculates the molecular weight.

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named `MW`.

**Author(s)**

Nan Xiao <http://nanx.me>

**Examples**

```r
smi = system.file('vignettes/FDA/SMILES.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugWeight(mol)
head(dat)
```

---

extractDrugWeightedPath

*Descriptor that Calculates the Weighted Path (Molecular ID)*

**Description**

Descriptor that Calculates the Weighted Path (Molecular ID)

**Usage**

```r
extractDrugWeightedPath(molecules, silent = TRUE)
```

**Arguments**

- `molecules` Parsed molecule object.
- `silent` Logical. Whether the calculating process should be shown or not, default is `TRUE`.

**Details**

This descriptor calculates the weighted path (molecular ID) described by Randic, characterizing molecular branching. Five descriptors are calculated, based on the implementation in the ADAPT software package. Note that the descriptor is based on identifying all paths between pairs of atoms and so is NP-hard. This means that it can take some time for large, complex molecules.
Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 5 columns named WTPT.1, WTPT.2, WTPT.3, WTPT.4, WTPT.5:

- WTPT.1 - molecular ID
- WTPT.2 - molecular ID / number of atoms
- WTPT.3 - sum of path lengths starting from heteroatoms
- WTPT.4 - sum of path lengths starting from oxygens
- WTPT.5 - sum of path lengths starting from nitrogens

Author(s)

Nan Xiao <http://nanx.me>

References

Examples

```r
smi = system.file('vignettes/Rcpi/vignettes/FDAMDD.smi', package = 'Rcpi')
mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugWeightedPath(mol)
head(dat)
```

extractDrugWHIM

Calculate Holistic Descriptors Described by Todeschini et al.

Description

Calculate Holistic Descriptors Described by Todeschini et al.

Usage

```r
extractDrugWHIM(molecules, silent = TRUE)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>molecules</td>
<td>Parsed molecule object.</td>
</tr>
<tr>
<td>silent</td>
<td>Logical. Whether the calculating process should be shown or not, default is TRUE.</td>
</tr>
</tbody>
</table>
Details

Holistic descriptors described by Todeschini et al, the descriptors are based on a number of atom weightings. There are six different possible weightings:

- unit weights
- atomic masses
- van der Waals volumes
- Mulliken atomic electronegativites
- atomic polarizabilities
- E-state values described by Kier and Hall

Currently weighting schemes 1, 2, 3, 4 and 5 are implemented. The weight values are taken from Todeschini et al. and as a result 19 elements are considered. For each weighting scheme we can obtain

- 11 directional WHIM descriptors (\( \lambda_1 .. 3, \, \nu_1 .. 2, \, \gamma_1 .. 3, \, \eta_1 .. 3 \))
- 6 non-directional WHIM descriptors (T, A, V, K, G, D)

Though Todeschini et al. mentions that for planar molecules only 8 directional WHIM descriptors are required the current code will return all 11.

Value

A data frame, each row represents one of the molecules, each column represents one feature. This function returns 17 columns:

- \( W_{\lambda_1} \)
- \( W_{\lambda_2} \)
- \( w_{\lambda_3} \)
- \( W_{\nu_1} \)
- \( W_{\nu_2} \)
- \( W_{\gamma_1} \)
- \( W_{\gamma_2} \)
- \( W_{\gamma_3} \)
- \( W_{\eta_1} \)
- \( W_{\eta_2} \)
- \( W_{\eta_3} \)
- \( W_T \)
- \( W_A \)
- \( W_V \)
- \( W_K \)
- \( W_G \)
- \( W_D \)

Each name will have a suffix of the form \(.X\) where \(X\) indicates the weighting scheme used. Possible values of \(X\) are

- unity
extractDrugWienerNumbers

- mass
- volume
- eneg
- polar

extractDrugWienerNumbers

Descriptor that Calculates Wiener Path Number and Wiener Polarity Number

Usage
extractDrugWienerNumbers(molecules, silent = TRUE)

Arguments
molecules Parsed molecule object.
silent Logical. Whether the calculating process should be shown or not, default is TRUE.

Details
This descriptor calculates the Wiener numbers, including the Wiener Path number and the Wiener Polarity Number. Wiener path number: half the sum of all the distance matrix entries; Wiener polarity number: half the sum of all the distance matrix entries with a value of 3.

Value
A data frame, each row represents one of the molecules, each column represents one feature. This function returns two columns named WPATH (weiner path number) and WPOL (weiner polarity number).
Author(s)
Nan Xiao <http://nanx.me>

References

Examples

```r
smi = system.file('vignettes/dd/FOAMDD.smi', package = 'Rcpp')
mol = readMolFromSmi(smi, type = 'mol')

```

### extractDrugXLogP

**Descriptor that Calculates the Prediction of logP Based on the Atom-Type Method Called XLogP**

**Usage**

```r
extractDrugXLogP(molecules, silent = TRUE)
```

**Arguments**

- `molecules`: Parsed molecule object.
- `silent`: Logical. Whether the calculating process should be shown or not, default is `TRUE`.

**Details**

Prediction of logP based on the atom-type method called XLogP.

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named `XLogP`.

**Author(s)**

Nan Xiao <http://nanx.me>

**References**

Examples

```r
smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugXLogP(mol)
head(dat)
```

---

**extractDrugZagrebIndex**

*Descriptor that Calculates the Sum of the Squared Atom Degrees of All Heavy Atoms*

**Description**

Descriptor that Calculates the Sum of the Squared Atom Degrees of All Heavy Atoms

**Usage**

```r
extractDrugZagrebIndex(molecules, silent = TRUE)
```

**Arguments**

- **molecules**: Parsed molecule object.
- **silent**: Logical. Whether the calculating process should be shown or not, default is TRUE.

**Details**

Zagreb index: the sum of the squares of atom degree over all heavy atoms

**Value**

A data frame, each row represents one of the molecules, each column represents one feature. This function returns one column named Zagreb.

**Author(s)**

Nan Xiao <http://nanx.me>

**Examples**

```r
smi = system.file('vignettes/FDAMDD.smi', package = 'Rcpi')

mol = readMolFromSmi(smi, type = 'mol')
dat = extractDrugZagrebIndex(mol)
head(dat)
```
extractPCMBLOSUM  Generalized BLOSUM and PAM Matrix-Derived Descriptors

Description

Generalized BLOSUM and PAM Matrix-Derived Descriptors

Usage

extractPCMBLOSUM(x, submat = "AABLOSUM62", k, lag, scale = TRUE, silent = TRUE)

Arguments

x A character vector, as the input protein sequence.
submat Substitution matrix for the 20 amino acids. Should be one of AABLOSUM45, AABLOSUM50, AABLOSUM62, AABLOSUM80, AABLOSUM100, AAPAM30, AAPAM40, AAPAM70, AAPAM120, AAPAM250. Default is 'AABLOSUM62'.
k Integer. The number of selected scales (i.e. the first k scales) derived by the substitution matrix. This could be selected according to the printed relative importance values.
lag The lag parameter. Must be less than the amino acids.
scale Logical. Should we auto-scale the substitution matrix (submat) before doing eigen decomposition? Default is TRUE.
silent Logical. Whether we print the relative importance of each scales (diagonal value of the eigen decomposition result matrix B) or not. Default is TRUE.

Details

This function calculates the generalized BLOSUM matrix-derived descriptors. For users' convenience, Rcpi provides the BLOSUM45, BLOSUM50, BLOSUM62, BLOSUM80, BLOSUM100, PAM30, PAM40, PAM70, PAM120, and PAM250 matrices for the 20 amino acids to select.

Value

A length lag * p^2 named vector, p is the number of scales selected.

Author(s)

Nan Xiao <http://nanx.me>

References

Examples

x = readFASTA(system.file('protseq/P00750.fasta', package = 'Rcpi'))[[1]]
blosum = extractPCMBLOSUM(x, submat = 'AABLOSUM62', k = 5, lag = 7, scale = TRUE, silent = FALSE)
extractPCMDescScales  Scales-Based Descriptors with 20+ classes of Molecular Descriptors

Description
Scales-Based Descriptors with 20+ classes of Molecular Descriptors

Usage
extractPCMDescScales(x, propmat, index = NULL, pc, lag, scale = TRUE, silent = TRUE)

Arguments
x A character vector, as the input protein sequence.
propmat The matrix containing the descriptor set for the amino acids, which could be chosen from AAMOE2D, AAMOE3D, AACPSA, AADescAll, AA2DACOR, AA3DMoRSE, AAACF, AABurden, AACConn, AAConst, AAEdgeAdj, AAEigIdx, AAFGC, AAGeom, AAGETAWAY, AAInfo, AMolProp, AARandic, AARD, AA topo, AATopoChg, AAWalk, AAWHIM.
index Integer vector or character vector. Specify which molecular descriptors to select from one of these descriptor sets by specify the numerical or character index of the molecular descriptors in the descriptor set. Default is NULL, means selecting all the molecular descriptors in this descriptor set.
pc Integer. The maximum dimension of the space which the data are to be represented in. Must be no greater than the number of AA properties provided.
lag The lag parameter. Must be less than the amino acids.
scale Logical. Should we auto-scale the property matrix (propmat) before doing MDS? Default is TRUE.
silent Logical. Whether we print the standard deviation, proportion of variance and the cumulative proportion of the selected principal components or not. Default is TRUE.

Details
This function calculates the scales-based descriptors with molecular descriptors sets calculated by Dragon, Discovery Studio and MOE. Users could specify which molecular descriptors to select from one of these descriptor sets by specify the numerical or character index of the molecular descriptors in the descriptor set.

Value
A length lag * p^2 named vector, p is the number of scales selected.

Author(s)
Nan Xiao <http://nanx.me>

See Also
See extractPCMScales for generalized AA-descriptor based scales descriptors.
Examples

```r
x = readFASTA(system.file('protseq/P00750.fasta', package = 'Rcpi'))[[1]]
descscales = extractPCMFAScales(x, propmat = 'AA topo', index = c(37:41, 43:47),
                                pc = 5, lag = 7, silent = FALSE)
```

Description

Generalized Scales-Based Descriptors derived by Factor Analysis

Usage

```r
extractPCMFAScales(x, propmat, factors, scores = "regression", lag,
                    scale = TRUE, silent = TRUE)
```

Arguments

- `x`: A character vector, as the input protein sequence.
- `propmat`: A matrix containing the properties for the amino acids. Each row represent one amino acid type, each column represents one property. Note that the one-letter row names must be provided for we need them to seek the properties for each AA type.
- `factors`: Integer. The number of factors to be fitted. Must be no greater than the number of AA properties provided.
- `scores`: Type of scores to produce. The default is "regression", which gives Thompson’s scores, "Bartlett" given Bartlett’s weighted least-squares scores.
- `lag`: The lag parameter. Must be less than the amino acids number in the protein sequence.
- `scale`: Logical. Should we auto-scale the property matrix (propmat) before doing Factor Analysis? Default is TRUE.
- `silent`: Logical. Whether we print the SS loadings, proportion of variance and the cumulative proportion of the selected factors or not. Default is TRUE.

Details

This function calculates the generalized scales-based descriptors derived by Factor Analysis (FA). Users could provide customized amino acid property matrices.

Value

A length lag * p^2 named vector, p is the number of scales (factors) selected.

Author(s)

Nan Xiao <http://nanx.me>

Examples

```r
x = readFASTA(system.file('protseq/P00750.fasta', package = 'Rcpi'))[[1]]
data(AATopo)
tprops = AATopo[, c(37:41, 43:47)] # select a set of topological descriptors
fa = extractPCMFAScales(x, propmat = tprops, factors = 5, lag = 7, silent = FALSE)
```

### extractPCMDSScales

**Generalized Scales-Based Descriptors derived by Multidimensional Scaling**

**Description**

Generalized Scales-Based Descriptors derived by Multidimensional Scaling

**Usage**

```r
extractPCMDSScales(x, propmat, k, lag, scale = TRUE, silent = TRUE)
```

**Arguments**

- `x`: A character vector, as the input protein sequence.
- `propmat`: A matrix containing the properties for the amino acids. Each row represents one amino acid type, each column represents one property. Note that the one-letter row names must be provided for we need them to seek the properties for each AA type.
- `k`: Integer. The maximum dimension of the space which the data are to be represented in. Must be no greater than the number of AA properties provided.
- `lag`: The lag parameter. Must be less than the amino acids.
- `scale`: Logical. Should we auto-scale the property matrix (`propmat`) before doing MDS? Default is `TRUE`.
- `silent`: Logical. Whether we print the `k` eigenvalues computed during the scaling process or not. Default is `TRUE`.

**Details**

This function calculates the generalized scales-based descriptors derived by Multidimensional Scaling (MDS). Users could provide customized amino acid property matrices.

**Value**

A length `lag * p^2` named vector, `p` is the number of scales (dimensionality) selected.

data(AATopo)
tprops = AATopo[, c(37:41, 43:47)] # select a set of topological descriptors
mds = extractPCMDSScales(x, propmat = tprops, k = 5, lag = 7, silent = FALSE)
```

extractPCMPropScales Generalized AA-Properties Based Scales Descriptors

Description
Generalized AA-Properties Based Scales Descriptors

Usage

```
extractPCMPropScales(x, index = NULL, pc, lag, scale = TRUE, silent = TRUE)
```

Arguments

- `x`: A character vector, as the input protein sequence.
- `index`: Integer vector or character vector. Specify which AAindex properties to select from the AAindex database by specify the numerical or character index of the properties in the AAindex database. Default is NULL, means selecting all the AA properties in the AAindex database.
- `pc`: Integer. Use the first pc principal components as the scales. Must be no greater than the number of AA properties provided.
- `lag`: The lag parameter. Must be less than the amino acids.
- `scale`: Logical. Should we auto-scale the property matrix before PCA? Default is TRUE.
- `silent`: Logical. Whether we print the standard deviation, proportion of variance and the cumulative proportion of the selected principal components or not. Default is TRUE.
This function calculates the generalized amino acid properties based scales descriptors. Users could specify which AAindex properties to select from the AAindex database by specify the numerical or character index of the properties in the AAindex database.

Value
A length $\text{lag} \times p^2$ named vector, $p$ is the number of scales (principal components) selected.

Author(s)
Nan Xiao <http://nanx.me>

See Also
See `extractPCMScales` for generalized scales-based descriptors.

Examples
```r
x = readFASTA(system.file('protseq/P00750.fasta', package = 'Rcpp'))[[1]]
propscales = extractPCMPropScales(x, index = c(160:165, 258:296), pc = 5, lag = 7, silent = FALSE)
```

---

**Description**

Generalized Scales-Based Descriptors derived by Principal Components Analysis

**Usage**

```r
extractPCMScales(x, propmat, pc, lag, scale = TRUE, silent = TRUE)
```

**Arguments**

- `x` A character vector, as the input protein sequence.
- `propmat` A matrix containing the properties for the amino acids. Each row represent one amino acid type, each column represents one property. Note that the one-letter row names must be provided for we need them to seek the properties for each AA type.
- `pc` Integer. Use the first `pc` principal components as the scales. Must be no greater than the number of AA properties provided.
- `lag` The lag parameter. Must be less than the amino acids.
- `scale` Logical. Should we auto-scale the property matrix (`propmat`) before PCA? Default is `TRUE`.
- `silent` Logical. Whether we print the standard deviation, proportion of variance and the cumulative proportion of the selected principal components or not. Default is `TRUE`. 
**extractProtAAC**

This function calculates the generalized scales-based descriptors derived by Principal Components Analysis (PCA). Users could provide customized amino acid property matrices. This function implements the core computation procedure needed for the generalized scales-based descriptors derived by AA-Properties (AAindex) and generalized scales-based descriptors derived by 20+ classes of 2D and 3D molecular descriptors (Topological, WHIM, VHSE, etc.).

**Value**

A length $\text{l}ag \times p^2$ named vector, $p$ is the number of scales (principal components) selected.

**Author(s)**

Nan Xiao <http://nanx.me>

**See Also**

See `extractPCMDescScales` for generalized AA property based scales descriptors, and `extractPCMPropScales` for (19 classes) AA descriptor based scales descriptors.

**Examples**

```r
x = readFASTA(system.file('/Var/protseq/P00750.fasta', package = 'Rcpi'))[[1]]
data(AAindex)
AAidxmat = t(na.omit(as.matrix(AAindex[, 7:26])))
scales = extractPCMScales(x, propmat = AAidxmat, pc = 5, lag = 7, silent = FALSE)
```

---

**Description**

Amino Acid Composition Descriptor

**Usage**

`extractProtAAC(x)`

**Arguments**

- `x` A character vector, as the input protein sequence.

**Details**

This function calculates the Amino Acid Composition descriptor (Dim: 20).

**Value**

A length 20 named vector
Amphiphilic Pseudo Amino Acid Composition Descriptor

Usage

```r
extractProtAPAAC(x, props = c("Hydrophobicity", "Hydrophilicity"),
lambda = 30, w = 0.05, customprops = NULL)
```

Arguments

- `x` A character vector, as the input protein sequence.
- `props` A character vector, specifying the properties used. 2 properties are used by default, as listed below:
  - 'Hydrophobicity' Hydrophobicity value of the 20 amino acids
  - 'Hydrophilicity' Hydrophilicity value of the 20 amino acids
- `lambda` The lambda parameter for the APAAC descriptors, default is 30.
- `w` The weighting factor, default is 0.05.
- `customprops` An n x 21 named data frame contains n customize property. Each row contains one property. The column order for different amino acid types is 'AccNo', 'A', 'R', 'N', 'D', 'C', 'E', 'Q', 'G', 'H', 'I', 'L', 'K', 'M', 'F', 'P', 'S', 'T', 'W', 'Y', 'V', and the columns should also be exactly named like this. The AccNo column contains the properties' names. Then users should explicitly specify these properties with these names in the argument `props`. See the examples below for a demonstration. The default value for customprops is NULL.
extractProtAPAAC

Details

This function calculates the Amphiphilic Pseudo Amino Acid Composition (APAAC) descriptor (Dim: \(20 + (n \times \lambda)\), \(n\) is the number of properties selected, default is 80).

Value

A length \(20 + n \times \lambda\) named vector, \(n\) is the number of properties selected.

Note

Note the default \(20 \times 2\) prop values have been already independently given in the function. Users could also specify other (up to 544) properties with the Accession Number in the AAindex data, with or without the default three properties, which means users should explicitly specify the properties to use.

**extractProtGeary**  
*Geary Autocorrelation Descriptor*

**Description**

Geary Autocorrelation Descriptor

**Usage**

```r
extractProtGeary(x, props = c("CIDH920105", "BHAR880101", "CHAM820101",  
"CHAM820102", "CHO870101", "BIGC670101", "CHAM810101", "DAYM780201"),  
nlag = 30L, customprops = NULL)
```
extractProtGeary

Arguments

x  A character vector, as the input protein sequence.
props  A character vector, specifying the Accession Number of the target properties. 8 properties are used by default, as listed below:
  AccNo. CIDH920105 Normalized average hydrophobicity scales (Cid et al., 1992)
  AccNo. BHAR88080101 Average flexibility indices (Bhaskaran-Ponnuswamy, 1988)
  AccNo. CHAM820201 Polarizability parameter (Charton-Charton, 1982)
  AccNo. CHAM8202012 Free energy of solution in water, kcal/mole (Charton-Charton, 1982)
  AccNo. CHOC760101 Residue accessible surface area in tripeptide (Chothia, 1976)
  AccNo. BIGC670101 Residue volume (Bigelow, 1967)
  AccNo. CHAM810101 Steric parameter (Charton, 1981)
  AccNo. DAYM780201 Relative mutability (Dayhoff et al., 1978b)
nlag  Maximum value of the lag parameter. Default is 30.
customprops  A n x 21 named data frame contains n customize property. Each row contains one property. The column order for different amino acid types is 'AccNo', 'A', 'R', 'N', 'D', 'C', 'E', 'Q', 'G', 'H', 'I', 'L', 'K', 'M', 'F', 'P', 'S', 'T', 'W', 'Y', 'V', and the columns should also be exactly named like this. The AccNo column contains the properties’ names. Then users should explicitly specify these properties with these names in the argument props. See the examples below for a demonstration. The default value for customprops is NULL.

Details

This function calculates the Geary autocorrelation descriptor (Dim: length(props) * nlag).

Value

A length nlag named vector

                          "MYProp1", "MYProp2", "MYProp3"))

extractProtMoran

Moran Autocorrelation Descriptor

Description

Moran Autocorrelation Descriptor

Usage

extractProtMoran(x, props = c("CIDH920105", "BHAR880101", "CHAM820101",
                             "CHAM820102", "CHOC760101", "BIGC670101", "CHAM810101",
                             "DAYM780201"),
                nlag = 30L, customprops = NULL)

Arguments

x       A character vector, as the input protein sequence.

props   A character vector, specifying the Accession Number of the target properties. 8 properties are used by default, as listed below:
          AccNo. CIDH920105 Normalized average hydrophobicity scales (Cid et al., 1992)
          AccNo. BHAR880101 Average flexibility indices (Bhaskaran-Ponnuswamy, 1988)
          AccNo. CHAM820101 Polarizability parameter (Charton-Charton, 1982)
          AccNo. CHAM820102 Free energy of solution in water, kcal/mole (Charton-Charton, 1982)
          AccNo. CHOC760101 Residue accessible surface area in tripeptide (Chothia, 1976)
          AccNo. BIGC670101 Residue volume (Bigelow, 1967)
          AccNo. CHAM810101 Steric parameter (Charton, 1981)
AccNo. DAYM780201  Relative mutability (Dayhoff et al., 1978b)

nlag
Maximum value of the lag parameter. Default is 30.

customprops
A \text{n x 21} named data frame contains \text{n} customize property. Each row contains one property. The column order for different amino acid types is 'AccNo', 'A', 'R', 'N', 'D', 'C', 'E', 'Q', 'G', 'H', 'I', 'L', 'K', 'M', 'F', 'P', 'S', 'T', 'W', 'Y', 'V', and the columns should also be exactly named like this. The AccNo column contains the properties' names. Then users should explicitly specify these properties with these names in the argument \text{props}. See the examples below for a demonstration. The default value for customprops is NULL.

Details
This function calculates the Moran autocorrelation descriptor (Dim: \text{length(props) \times nlag}).

Value
A length \text{nlag} named vector

extractProtMoreauBroto

Normalized Moreau-Broto Autocorrelation Descriptor

Description

Normalized Moreau-Broto Autocorrelation Descriptor

Usage

extractProtMoreauBroto(x, props = c("CIDH920105", "BHAR880101", "CHAM820101", "CHAM820102", "CHOC760101", "BIGC670101", "CHAM810101", "DAYM780201"), nlag = 30L, customprops = NULL)

Arguments

x
A character vector, as the input protein sequence.

customprops
A character vector, specifying the Accession Number of the target properties. 8 properties are used by default, as listed below:

- **AccNo. CIDH920105**: Normalized average hydrophobicity scales (Cid et al., 1992)
- **AccNo. BHAR880101**: Average flexibility indices (Bhaskaran-Ponnuswamy, 1988)
- **AccNo. CHAM820101**: Polarizability parameter (Charton-Charton, 1982)
- **AccNo. CHAM820102**: Free energy of solution in water, kcal/mole (Charton-Charton, 1982)
- **AccNo. CHOC760101**: Residue accessible surface area in tripeptide (Chothia, 1976)
- **AccNo. BIGC670101**: Residue volume (Bigelow, 1967)
- **AccNo. CHAM810101**: Steric parameter (Charton, 1981)
- **AccNo. DAYM780201**: Relative mutability (Dayhoff et al., 1978b)

nlag
Maximum value of the lag parameter. Default is 30.

customprops
A n x 21 named data frame contains n customize property. Each row contains one property. The column order for different amino acid types is 'AccNo', 'A', 'R', 'N', 'D', 'C', 'E', 'Q', 'G', 'H', 'I', 'L', 'K', 'M', 'F', 'P', 'S', 'T', 'W', 'Y', 'V', and the columns should also be *exactly* named like this. The AccNo column contains the properties' names. Then users should explicitly specify these properties with these names in the argument props. See the examples below for a demonstration. The default value for customprops is NULL.

Details

This function calculates the normalized Moreau-Broto autocorrelation descriptor (Dim: length(props) * nlag).

# Use 4 properties in the AAindex database, and 3 customized properties
extractProtMoreauBroto(x, customprops = myprops,
props = c("CIDH920105", "BHAR880101", "CHAM820101", "CHAM820102",
"MyProp1", "MyProp2", "MyProp3"))
Pseudo Amino Acid Composition Descriptor

Usage

extractProtPAAC(x, props = c("Hydrophobicity", "Hydrophilicity", "SideChainMass"), lambda = 30, w = 0.05, customprops = NULL)

Arguments

- x: A character vector, as the input protein sequence.
- props: A character vector, specifying the properties used. 3 properties are used by default, as listed below:
  - 'Hydrophobicity': Hydrophobicity value of the 20 amino acids
  - 'Hydrophilicity': Hydrophilicity value of the 20 amino acids
  - 'SideChainMass': Side-chain mass of the 20 amino acids
- lambda: The lambda parameter for the PAAC descriptors, default is 30.
- w: The weighting factor, default is 0.05.
- customprops: A n x 21 named data frame contains n customize property. Each row contains one property. The column order for different amino acid types is 'AccNo', 'A', 'R', 'N', 'D', 'C', 'E', 'Q', 'G', 'H', 'I', 'L', 'K', 'M', 'F', 'P', 'S', 'T', 'W', 'Y', 'V', and the columns should also be exactly named like this. The AccNo column contains the properties’ names. Then users should explicitly specify these properties with these names in the argument props. See the examples below for a demonstration. The default value for customprops is NULL.

Details

This function calculates the Pseudo Amino Acid Composition (PAAC) descriptor (Dim: 20 + lambda, default is 50).

Value

A length 20 + lambda named vector

Note

Note the default 20 * 3 prop values have been already independently given in the function. Users could also specify other (up to 544) properties with the Accession Number in the AAindex data, with or without the default three properties, which means users should explicitly specify the properties to use.

```

`extractProtPSSM`  
**Compute PSSM (Position-Specific Scoring Matrix) for given protein sequence**

Description

Compute PSSM (Position-Specific Scoring Matrix) for given protein sequence
extractProtPSSM

Usage

extractProtPSSM(seq, start.pos = 1L, end.pos = nchar(seq),
  psiblast.path = NULL, makeblastdb.path = NULL, database.path = NULL,
  iter = 5, silent = TRUE, evalue = 10L, word.size = NULL,
  gapopen = NULL, gapextend = NULL, matrix = "BLOSUM62",
  threshold = NULL, seg = "no", soft.masking = FALSE,
  culling.limit = NULL, best.hit.overhang = NULL,
  best.hit.score.edge = NULL, xdrop.ungap = NULL, xdrop.gap = NULL,
  xdrop.gap.final = NULL, window.size = NULL, gap.trigger = 22L,
  num.threads = 1L, pseudocount = 0L, inclusion.ethresh = 0.002)

Arguments

seq Character vector, as the input protein sequence.
start.pos Optional integer denoting the start position of the fragment window. Default is
  1, i.e. the first amino acid of the given sequence.
end.pos Optional integer denoting the end position of the fragment window. Default is
  nchar(seq), i.e. the last amino acid of the given sequence.
psiblast.path Character string indicating the path of the psiblast program. If NCBI Blast+
  was previously installed in the operation system, the path will be automatically
detected.
makeblastdb.path Character string indicating the path of the makeblastdb program. If NCBI
  Blast+ was previously installed in the system, the path will be automatically
detected.
database.path Character string indicating the path of a reference database (a FASTA file).
iter Number of iterations to perform for PSI-Blast.
silent Logical. Whether the PSI-Blast running output should be shown or not (May
  not work on some Windows versions and PSI-Blast versions), default is TRUE.
evalue Expectation value (E) threshold for saving hits. Default is 10.
word.size Word size for wordfinder algorithm. An integer >= 2.
gapopen Integer. Cost to open a gap.
gapextend Integer. Cost to extend a gap.
matrix Character string. The scoring matrix name (default is 'BLOSUM62').
threshold Minimum word score such that the word is added to the BLAST lookup table.
  A real value >= 0.
seg Character string. Filter query sequence with SEG ('yes', 'window locut hicut',
  or 'no' to disable) Default is 'no'.
soft.masking Logical. Apply filtering locations as soft masks? Default is FALSE.
culling.limit An integer >= 0. If the query range of a hit is enveloped by that of at least this
  many higher-scoring hits, delete the hit. Incompatible with best.hit.overhang
  and best_hit_score_edge.
best.hit.overhang Best Hit algorithm overhang value (A real value >= 0 and <= 0.5, recommended
  value: 0.1). Incompatible with culling.limit.
best.hit.score.edge Best Hit algorithm score edge value (A real value >=0 and <= 0.5, recommended
  value: 0.1). Incompatible with culling.limit.
**extractProtPSSM**

- **xdrop.ungap**: X-dropoff value (in bits) for ungapped extensions.
- **xdrop.gap**: X-dropoff value (in bits) for preliminary gapped extensions.
- **xdrop.gap.final**: X-dropoff value (in bits) for final gapped alignment.
- **window.size**: An integer >= 0. Multiple hits window size. To specify 1-hit algorithm, use 0.
- **gap.trigger**: Number of bits to trigger gapping. Default is 22.
- **num.threads**: Integer. Number of threads (CPUs) to use in the BLAST search. Default is 1.
- **pseudocount**: Integer. Pseudo-count value used when constructing PSSM. Default is 0.
- **inclusion.ethresh**: E-value inclusion threshold for pairwise alignments. Default is 0.002.

**Details**

This function calculates the PSSM (Position-Specific Scoring Matrix) derived by PSI-Blast for given protein sequence or peptides. For given protein sequences or peptides, PSSM represents the log-likelihood of the substitution of the 20 types of amino acids at that position in the sequence. Note that the output value is not normalized.

**Value**

The original PSSM, a numeric matrix which has end.pos – start.pos + 1 columns and 20 named rows.

**Note**

The function requires the makeblastdb and psiblast programs to be properly installed in the operation system or their paths provided.

The two command-line programs are included in the NCBI-BLAST+ software package. To install NCBI Blast+, just open the NCBI FTP site using web browser or FTP software: ftp://anonymous@ftp.ncbi.nlm.nih.gov:21/blast/executables/blast+/LATEST/ then download the executable version of BLAST+ according to your operation system, and compile or install the downloaded source code or executable program.

Ubuntu/Debian users can directly use the command sudo apt-get install ncbi-blast+ to install NCBI Blast+. For OS X users, download ncbi-blast- ... .dmg then install. For Windows users, download ncbi-blast- ... .exe then install.

```

---

**extractProtPSSMAcc**

Profile-based protein representation derived by PSSM (Position-Specific Scoring Matrix) and auto cross covariance

### Description

Profile-based protein representation derived by PSSM (Position-Specific Scoring Matrix) and auto cross covariance

### Usage

`extractProtPSSMAcc(pssmmat, lag)`

### Arguments

- `pssmmat`: The PSSM computed by `extractProtPSSM`.
- `lag`: The lag parameter. Must be less than the number of amino acids in the sequence (i.e. the number of columns in the PSSM matrix).

### Details

This function calculates the feature vector based on the PSSM by running PSI-Blast and auto cross covariance transformation.

### Value

A length `lag * 20^2` named numeric vector, the element names are derived by the amino acid name abbreviation (crossed amino acid name abbreviation) and lag index.

### Author(s)

Nan Xiao [http://nanx.me](http://nanx.me)

pssmmat = extractProtPSSM(seq = x, database.path = dbpath)
pssmacc = extractProtPSSMAcc(pssmmat, lag = 3)
tail(pssmacc)
```

**Description**

Profile-based protein representation derived by PSSM (Position-Specific Scoring Matrix)

**Usage**

`extractProtPSSMFeature(pssmmat)`

**Arguments**

- `pssmmat`: The PSSM computed by `extractProtPSSM`.

**Details**

This function calculates the profile-based protein representation derived by PSSM. The feature vector is based on the PSSM computed by `extractProtPSSM`. For a given sequence, the PSSM feature represents the log-likelihood of the substitution of the 20 types of amino acids at that position in the sequence. Each PSSM feature value in the vector represents the degree of conservation of a given amino acid type. The value is normalized to interval (0, 1) by the transformation $1/(1+e^{-x})$.

**Value**

A numeric vector which has $20 \times N$ named elements, where $N$ is the size of the window (number of rows of the PSSM).

**Author(s)**

Nan Xiao <http://nanx.me>

Quasi-Sequence-Order (QSO) Descriptor

Usage

```r
extractProtQSO(x, nlag = 30, w = 0.1)
```

Arguments

- `x`: A character vector, as the input protein sequence.
- `nlag`: The maximum lag, default is 30.
- `w`: The weighting factor, default is 0.1.

Details

This function calculates the Quasi-Sequence-Order (QSO) descriptor (Dim: 20 + 20 + (2 * nlag), default is 100).

Value

A length $20 + 20 + (2 \times nlag)$ named vector

Author(s)

Nan Xiao <http://nanx.me>

References

**extractProtSOCN**

**See Also**

See `extractProtSOCN` for sequence-order-coupling numbers.

```

---

**Sequence-Order-Coupling Numbers**

**Description**

Sequence-Order-Coupling Numbers

**Usage**

```r
extractProtSOCN(x, nlag = 30)
```

**Arguments**

- `x`: A character vector, as the input protein sequence.
- `nlag`: The maximum lag, default is 30.

**Details**

This function calculates the Sequence-Order-Coupling Numbers (Dim: nlag * 2, default is 60).

**Value**

A length nlag * 2 named vector

**Author(s)**

Nan Xiao <http://nanx.me>

**extractProtTC**

### Description

Tripeptide Composition Descriptor

### Usage

```r
extractProtTC(x)
```

### Arguments

- `x` A character vector, as the input protein sequence.

### Details

This function calculates the Tripeptide Composition descriptor (Dim: 8000).

### Value

A length 8000 named vector

### Author(s)

Nan Xiao &lt;http://nanx.me&gt;

### References

### See Also

See `extractProtAAC` and `extractProtDC` for Amino Acid Composition and Dipeptide Composition descriptors.

### Examples

```r
x = readFASTA(system.file('protseq/P00750.fasta', package = 'Rcpi'))[[1]]
extractProtTC(x)
```
**getCPI**

Generating Compound-Protein Interaction Descriptors

**Description**

Generating Compound-Protein Interaction Descriptors

**Usage**

```r
ggetCPI(drugmat, protmat, type = c("combine", "tensorprod"))
```

**Arguments**

- `drugmat`: The compound descriptor matrix.
- `protmat`: The protein descriptor matrix.
- `type`: The interaction type, one or two of "combine" and "tensorprod".

**Details**

This function calculates the compound-protein interaction descriptors by three types of interaction:

- `combine`: combine the two descriptor matrix, result has \((p1 + p2)\) columns
- `tensorprod`: calculate column-by-column (pseudo)-tensor product type interactions, result has \((p1 \times p2)\) columns

**Value**

A matrix containing the compound-protein interaction descriptors

**Author(s)**

Nan Xiao [http://nanx.me](http://nanx.me)

**See Also**

See `getPPI` for generating protein-protein interaction descriptors.

**Examples**

```r
x = matrix(1:10, ncol = 2)
y = matrix(1:15, ncol = 3)

getCPI(x, y, 'combine')
getCPI(x, y, 'tensorprod')
getCPI(x, y, type = c('combine', 'tensorprod'))
```

```r
```
### Description

Retrieve Drug Molecules in MOL and SMILES Format from Databases

### Usage

```r
getDrug(id, from = c("pubchem", "chembl", "cas", "kegg", "drugbank"),
        type = c("mol", "smile"), parallel = 5)
```

### Arguments

- **id**: A character vector, as the drug ID(s).
- **from**: The database, one of 'pubchem', 'chembl', 'cas', 'kegg', 'drugbank'.
- **type**: The returned molecule format, mol or smile.
- **parallel**: An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

### Details

This function retrieves drug molecules in MOL and SMILES format from five databases.

### Value

A length of id character vector, each element containing the corresponding drug molecule.

### Author(s)

Nan Xiao [http://nanx.me](http://nanx.me)

### See Also

See `getProt` for retrieving protein sequences from three databases.

### Examples

```r
id = c("DB00859", "DB00860")

getDrug(id, "drugbank", "smile")
```
getFASTAFromKEGG

Retrieve Protein Sequence in FASTA Format from the KEGG Database

Description

Retrieve Protein Sequence in FASTA Format from the KEGG Database

Usage

getFASTAFromKEGG(id, parallel = 5)

Arguments

id A character vector, as the protein ID.
parallel An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details

This function retrieves protein sequences in FASTA format from the KEGG database.

Value

A list, each component contains one of the protein sequences in FASTA format.

Author(s)

Nan Xiao <http://nanx.me>

See Also

See getSeqFromKEGG for retrieving protein represented by amino acid sequence from the KEGG database. See readFASTA for reading FASTA format files.

Examples

```r
id = c('hsa:10161', 'hsa:10162')
getFASTAFromKEGG(id)
```
getFASTAFromUniProt

Retrieve Protein Sequence in FASTA Format from the UniProt Database

Description
Retrieve Protein Sequence in FASTA Format from the UniProt Database

Usage
getFASTAFromUniProt(id, parallel = 5)

Arguments
id A character vector, as the protein ID.
parallel An integer, the parallel parameter, indicates how many processes the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details
This function retrieves protein sequences in FASTA format from the UniProt database.

Value
A list, each component contains one of the protein sequences in FASTA format.

Author(s)
Nan Xiao <http://nanx.me>

References

See Also
See getSeqFromUniProt for retrieving protein represented by amino acid sequence from the UniProt database. See readFASTA for reading FASTA format files.

Examples
id = c('P00750', 'P00751', 'P00752')

getFASTAFromUniProt(id)
getMolFromCAS

Retrieve Drug Molecules in InChI Format from the CAS Database

Description
Retrieve Drug Molecules in InChI Format from the CAS Database

Usage
getMolFromCAS(id, parallel = 5)

Arguments
- **id**: A character vector, as the CAS drug ID.
- **parallel**: An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details
This function retrieves drug molecules in InChI format from the CAS database. CAS database only provides InChI data, so here we return the molecule in InChI format, users could convert them to SMILES format using Open Babel (http://openbabel.org/) or other third-party tools.

Value
A length of `id` character vector, each element containing the corresponding drug molecule.

Author(s)
Nan Xiao <http://nanx.me>

See Also
See `getDrug` for retrieving drug molecules in MOL and SMILES Format from other databases.

Examples
```
id = '52-67-5'  # Penicillamine
getMolFromCAS(id)
```
getMolFromChEMBL  Retrieve Drug Molecules in MOL Format from the ChEMBL Database

Description
Retrieve Drug Molecules in MOL Format from the ChEMBL Database

Usage
getMolFromChEMBL(id, parallel = 5)

Arguments
id    A character vector, as the ChEMBL drug ID.
parallel An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details
This function retrieves drug molecules in MOL format from the ChEMBL database.

Value
A length of id character vector, each element containing the corresponding drug molecule.

Author(s)
Nan Xiao <http://nanx.me>

See Also
See getSmifFromChEMBL for retrieving drug molecules in SMILES format from the ChEMBL database.

Examples
id = 'CHEMBL1430'  # Penicillamine
getMolFromChEMBL(id)
getMolFromDrugBank

Get drug molecules in MOL format from the DrugBank database.

Usage

getAddressMolFromDrugBank(id, parallel = 5)

Arguments

id
A character vector, as the DrugBank drug ID.

parallel
An integer, the parallel parameter, indicates how many processes the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details

This function retrieves drug molecules in MOL format from the DrugBank database.

Value

A length of id character vector, each element containing the corresponding drug molecule.

Author(s)

Nan Xiao <http://nanx.me>

See Also

See `getSmiFromDrugBank` for retrieving drug molecules in SMILES format from the DrugBank database.

Examples

id = 'DB00859'  # Penicillamine

getMolFromKEGG

Retrieve Drug Molecules in MOL Format from the KEGG Database

Description
Retrieve Drug Molecules in MOL Format from the KEGG Database

Usage
getMolFromKEGG(id, parallel = 5)

Arguments
id A character vector, as the KEGG drug ID.
parallel An integer, the parallel parameter, indicates how many processes the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details
This function retrieves drug molecules in MOL format from the KEGG database.

Value
A length of id character vector, each element containing the corresponding drug molecule.

Author(s)
Nan Xiao <http://nanx.me>

See Also
See getSmiFromKEGG for retrieving drug molecules in SMILES format from the KEGG database.

Examples
id = 'D00496'  # Penicillamine
getMolFromKEGG(id)
getMolFromPubChem

Retrieve Drug Molecules in MOL Format from the PubChem Database

Description

Retrieve Drug Molecules in MOL Format from the PubChem Database

Usage

getMolFromPubChem(id, parallel = 5)

Arguments

id A character vector, as the PubChem drug ID.
parallel An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details

This function retrieves drug molecules in MOL format from the PubChem database.

Value

A length of id character vector, each element containing the corresponding drug molecule.

Author(s)

Nan Xiao <http://nanx.me>

See Also

See getSmiFromPubChem for retrieving drug molecules in SMILES format from the PubChem database.

Examples

id = c(‘7847562’, ’7847563’) # Penicillamine
getMolFromPubChem(id)
getPDBFromRCSBPDB

Retrieve Protein Sequence in PDB Format from RCSB PDB

Description

Retrieve Protein Sequence in PDB Format from RCSB PDB

Usage

getPDBFromRCSBPDB(id, parallel = 5)

Arguments

- **id**: A character vector, as the protein ID.
- **parallel**: An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details

This function retrieves protein sequences in PDB format from RCSB PDB.

Value

A list, each component contains one of the protein sequences in PDB format.

Author(s)

Nan Xiao <http://nanx.me>

See Also

See `getSeqFromRCSBPDB` for retrieving protein represented by amino acid sequence from the RCSB PDB database.

Examples

```r
id = c('4HBB', '4FF9')
getPDBFromRCSBPDB(id)
```
getPPI

Generating Protein-Protein Interaction Descriptors

Usage

getPPI(protmat1, protmat2, type = c("combine", "tensorprod", "entrywise"))

Arguments

protmat1 The first protein descriptor matrix, must have the same ncol with protmat2.
protmat2 The second protein descriptor matrix, must have the same ncol with protmat1.
type The interaction type, one or more of "combine", "tensorprod", and "entrywise".

Details

This function calculates the protein-protein interaction descriptors by three types of interaction:

- combine - combine the two descriptor matrix, result has \( p + p \) columns
- tensorprod - calculate column-by-column (pseudo)-tensor product type interactions, result has \( p \times p \) columns
- entrywise - calculate entrywise product and entrywise sum of the two matrices, then combine them, result has \( p + p \) columns

Value

A matrix containing the protein-protein interaction descriptors

Author(s)

Nan Xiao <http://nanx.me>

See Also

See getCPI for generating compound-protein interaction descriptors.

Examples

x = matrix(1:10, ncol = 2)
y = matrix(5:14, ncol = 2)

getPPI(x, y, type = 'combine')
getPPI(x, y, type = 'tensorprod')
getPPI(x, y, type = 'entrywise')
getPPI(x, y, type = c('combine', 'tensorprod'))
getPPI(x, y, type = c('combine', 'entrywise'))
getPPI(x, y, type = c('entrywise', 'tensorprod'))
getPPI(x, y, type = c('combine', 'entrywise', 'tensorprod'))
getProt

Retrieve Protein Sequence in various Formats from Databases

Description
Retrieve Protein Sequence in various Formats from Databases

Usage
getProt(id, from = c("uniprot", "kegg", "pdb"), type = c("fasta", "pdb", "aaseq"), parallel = 5)

Arguments
- id: A character vector, as the protein ID(s).
- from: The database, one of ‘uniprot’, ‘kegg’, or ‘pdb’.
- type: The returned protein format, one of ‘fasta’, ‘pdb’, or ‘aaseq’.
- parallel: An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details
This function retrieves protein sequence in various formats from three databases.

Value
A length of id character list, each element containing the corresponding protein sequence(s) or file(s).

Author(s)
Nan Xiao <http://nanx.me>

See Also
See getDrug for retrieving drug molecules from five databases.

Examples
id = c("P00750", "P00751", "P00752")
getProt(id, from = "uniprot", type = "aaseq")
getSeqFromKEGG

Retrieve Protein Sequence from the KEGG Database

Description

Retrieve Protein Sequence from the KEGG Database

Usage

getSeqFromKEGG(id, parallel = 5)

Arguments

id A character vector, as the protein ID.
parallel An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details

This function retrieves protein represented by amino acid sequence from the KEGG database.

Value

A list, each component contains one of the protein represented by amino acid sequence(s).

Author(s)

Nan Xiao <http://nanx.me>

See Also

See getFASTAFromKEGG for retrieving protein sequence in FASTA format from the KEGG database.

Examples

id = c('hsa:10161', 'hsa:10162')

Retrieve Protein Sequence from the UniProt Database

Description
Retrieve Protein Sequence from the UniProt Database

Usage
getSeqFromUniProt(id, parallel = 5)

Arguments
id
A character vector, as the protein ID.

parallel
An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details
This function retrieves protein represented by amino acid sequence from the UniProt database.

Value
A list, each component contains one of the protein represented by amino acid sequence(s).

Author(s)
Nan Xiao <http://nanx.me>

References

See Also

getSmiFromChEMBL

Retrieve Drug Molecules in SMILES Format from the ChEMBL Database

Description

Retrieve Drug Molecules in SMILES Format from the ChEMBL Database

Usage

getSmiFromChEMBL(id, parallel = 5)

Arguments

- id: A character vector, as the ChEMBL drug ID.
- parallel: An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details

This function retrieves drug molecules in SMILES format from the ChEMBL database.

Value

A length of id character vector, each element containing the corresponding drug molecule.

Author(s)

Nan Xiao <http://nanx.me>

See Also

See getMolFromChEMBL for retrieving drug molecules in MOL format from the ChEMBL database.

Examples

id = 'CHEMBL1430'  # Penicillamine
getSmiFromChEMBL(id)
Description

Retrieve Drug Molecules in SMILES Format from the DrugBank Database

Usage

getsmiFromDrugBank(id, parallel = 5)

Arguments

id A character vector, as the DrugBank drug ID.
parallel An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details

This function retrieves drug molecules in SMILES format from the DrugBank database.

Value

A length of id character vector, each element containing the corresponding drug molecule.

Author(s)

Nan Xiao <http://nanx.me>

See Also

See getsmolFromDrugBank for retrieving drug molecules in MOL format from the DrugBank database.

Examples

id = 'DB00859' # Penicillamine

getsmiFromDrugBank(id)
getSmiFromKEGG

Retrieve Drug Molecules in SMILES Format from the KEGG Database

Description
Retrieve Drug Molecules in SMILES Format from the KEGG Database

Usage
getSmiFromKEGG(id, parallel = 5)

Arguments
- **id**: A character vector, as the KEGG drug ID.
- **parallel**: An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details
This function retrieves drug molecules in SMILES format from the KEGG database.

Value
A length of id character vector, each element containing the corresponding drug molecule.

Author(s)
Nan Xiao <http://nanx.me>

See Also
See `getMolFromKEGG` for retrieving drug molecules in MOL format from the KEGG database.

Examples
```r
id = 'D00496'  # Penicillamine
getSmiFromKEGG(id)
```
getSmiFromPubChem

Retrieve Drug Molecules in SMILES Format from the PubChem Database

Description

Retrieve Drug Molecules in SMILES Format from the PubChem Database

Usage

getSmiFromPubChem(id, parallel = 5)

Arguments

id A character vector, as the PubChem drug ID.
parallel An integer, the parallel parameter, indicates how many process the user would like to use for retrieving the data (using RCurl), default is 5. For regular cases, we recommend a number less than 20.

Details

This function retrieves drug molecules in SMILES format from the PubChem database.

Value

A length of id character vector, each element containing the corresponding drug molecule.

Author(s)

Nan Xiao <http://nanx.me>

OptAA3d

OptAA3d.sdf - 20 Amino Acids Optimized with MOE 2011.10 (Semiempirical AM1)

**Description**

OptAA3d.sdf - 20 Amino Acids Optimized with MOE 2011.10 (Semiempirical AM1)

**Details**

OptAA3d.sdf - 20 Amino Acids Optimized with MOE 2011.10 (Semiempirical AM1)

**Value**

OptAA3d data

**Examples**

```r
# This example requires the rcdk package
# library('rcdk')
# optaa3d = load.molecules(system.file('sysdata/OptAA3d.sdf', package = 'Rcpi'))
# view.molecule.2d(optaa3d[[1]]) # view the first amino acid
```

---

**readFASTA**

Read Protein Sequences in FASTA Format

**Description**

Read Protein Sequences in FASTA Format

**Usage**

```r
readFASTA(file = system.file("protseq/P00750.fasta", package = "Rcpi"),
legacy.mode = TRUE, seqonly = FALSE)
```

**Arguments**

- `file` The name of the file which the sequences in fasta format are to be read from. If it does not contain an absolute or relative path, the file name is relative to the current working directory, `getwd`. The default here is to read the `P00750.fasta` file which is present in the `protseq` directory of the Rcpi package.
- `legacy.mode` If set to `TRUE`, lines starting with a semicolon `;` are ignored. Default value is `TRUE`.
- `seqonly` If set to `TRUE`, only sequences as returned without attempt to modify them or to get their names and annotations (execution time is divided approximately by a factor 3). Default value is `FALSE`.

**Details**

This function reads protein sequences in FASTA format.
readMolFromSDF

Value

The result character vector

Note

Note that any different sets of instances (chunklets), e.g. 1, 3, 7 and 4, 6, might belong to the same class and might belong to different classes.

Author(s)

Nan Xiao <http://nanx.me>

References

See Also

See readPDB for reading protein sequences in PDB format.

Examples

P00750 = readFASTA(system.file('protseq/P00750.fasta', package = 'Rcpi'))
P00750

readMolFromSDF  Read Molecules from SDF Files and Return Parsed Java Molecular Object

Description

Read Molecules from SDF Files and Return Parsed Java Molecular Object

Usage

readMolFromSDF(sdffile)

Arguments

sdffile  Character vector, containing SDF file location(s).

Details

This function reads molecules from SDF files and return parsed Java molecular object needed by extractDrug... functions.

Value

A list, containing parsed Java molecular object.
Author(s)
Nan Xiao <http://nanx.me>

See Also
See `readMolFromSmi` for reading molecules by SMILES string and returning parsed Java molecular object.

Examples
```r
sdf = system.file("compseq/DB00859.sdf", package = "Rcpi")
sdfs = c(system.file("compseq/DB00859.sdf", package = "Rcpi"),
        system.file("compseq/DB00860.sdf", package = "Rcpi"))
mol = readMolFromSDF(sdf)
mols = readMolFromSDF(sdfs)
```

Description
Read Molecules from SMILES Files and Return Parsed Java Molecular Object or Plain Text List

Usage
```r
readMolFromSmi(smifile, type = c("mol", "text"))
```

Arguments
- `smifile` Character vector, containing SMILES file location(s).
- `type` 'mol' or 'text'. 'mol' returns parsed Java molecular object, used for 'text' returns (plain-text) character string list. For common molecular descriptors and fingerprints, use 'mol'. For descriptors and fingerprints calculated by OpenBabel, i.e. functions named `extractDrugOB...()`, use 'text'.

Details
This function reads molecules from SMILES strings and return parsed Java molecular object or plain text list needed by `extractDrug...()` functions.

Value
A list, containing parsed Java molecular object or character strings.

Author(s)
Nan Xiao <http://nanx.me>
readPDB

See Also

See readMolFromSDF for reading molecules from SDF files and returning parsed Java molecular object.

Examples

```r
smi = system.file('vignettes/4HHB.smi', package = 'Rcpi')
mol1 = readMolFromSmi(smi, type = 'mol')
mol2 = readMolFromSmi(smi, type = 'text')
```

Description

Read Protein Sequences in PDB Format

Usage

```r
readPDB(file = system.file("protseq/4HHB.pdb", package = "Rcpi"))
```

Arguments

- **file**: The name of the file which the sequences in PDB format are to be read from. If it does not contain an absolute or relative path, the file name is relative to the current working directory, `getwd`. The default here is to read the 4HHB.pdb file which is present in the protseq directory of the Rcpi package.

Details

This function reads protein sequences in PDB (Protein Data Bank) format, and return the amino acid sequences represented by single-letter code.

Value

A character vector, representing the amino acid sequence of the single-letter code.

Author(s)

Nan Xiao <http://nanx.me>

References

See Also

See readFASTA for reading protein sequences in FASTA format.
Examples

Seq4HHB = readPDB(system.file('protseq/4HHB.pdb', package = 'Rcpi'))
Seq4HHB

searchDrug  Parallelized Drug Molecule Similarity Search by Molecular Fingerprints Similarity or Maximum Common Substructure Search

Description

Parallelized Drug Molecule Similarity Search by Molecular Fingerprints Similarity or Maximum Common Substructure Search

Usage

searchDrug(mol, moldb, cores = 2, method = c("fp", "mcs"),
  fptype = c("standard", "extended", "graph", "hybrid", "maccs", "estate",
    "pubchem", "kr", "shortestpath", "fp2", "fp3", "fp4", "obmaccs"),
  fpsim = c("tanimoto", "euclidian", "cosine", "dice", "hamming"),
  mcssim = c("tanimoto", "overlap"), ...)

Arguments

mol  The query molecule. The location of a sdf file containing one molecule.
moldb  The molecule database. The location of a sdf file containing all the molecules to be searched with.
cores  Integer. The number of CPU cores to use for parallel search, default is 2. Users could use the detectCores() function in the parallel package to see how many cores they could use.
method  ‘fp’ or ‘mcs’. Search by molecular fingerprints or by maximum common substructure searching.
mcssim  Similarity measure type for maximum common substructure search, only available when method = ‘mcs’. Including ‘tanimoto’ and ‘overlap’.
...  Other possible parameter for maximum common substructure search, see calcDrugMCSSim for available options.

Details

This function does compound similarity search derived by various molecular fingerprints with various similarity measures or derived by maximum common substructure search. This function runs for a query compound against a set of molecules.
Value

Named numerical vector. With the decreasing similarity value of the molecules in the database.

Author(s)

Nan Xiao <http://nanx.me>

Examples

```r
mol = system.file('compseq/DB00530.sdf', package = 'Rcpi')
# DrugBank ID DB00530: Erlotinib
moldb = system.file('compseq/tyrphostin.sdf', package = 'Rcpi')
# Database composed by searching 'tyrphostin' in PubChem and filtered by Lipinski's Rule of Five
searchDrug(mol, moldb, cores = 4, method = 'fp', fptype = 'maccs', fpsim = 'hamming')
searchDrug(mol, moldb, cores = 4, method = 'fp', fptype = 'fp2', fpsim = 'tanimoto')
searchDrug(mol, moldb, cores = 4, method = 'mcs', mcssim = 'tanimoto')
```

segProt

| Protein Sequence Segmentation |

Description

Protein Sequence Segmentation

Usage

```r
```

Arguments

- `x` A character vector, as the input protein sequence.
- `k` A positive integer, specifies the window size (half of the window), default is 7.

Details

This function extracts the segmentations from the protein sequence.

Value

A named list, each component contains one of the segmentations (a character string), names of the list components are the positions of the specified amino acid in the sequence.

Author(s)

Nan Xiao <http://nanx.me>
Examples

```
x = readFASTA(system.file('protseq/P00750.fasta', package = 'Rcpi'))[[1]]
segProt(x, aa = 'R', k = 5)
```
