Package ‘ToPASeq’

January 31, 2016

Type  Package
Title  Package for Topology-based Pathway Analysis of RNASeq data
Version  1.4.0
Date  2014-27-05
Author  Ivana Ihnatova, Eva Budinska
Maintainer  Ivana Ihnatova <ihnataov@iba.muni.cz>
Description  Implementation of seven methods for topology-based pathway analysis of both RNASeq and microarray data: SPIA, DEGraph, TopologyGSA, TAPPA, PRS, PWEA and a visualization tool for a single pathway.
Depends  graphite (>= 1.14), gRbase, graph, locfit, Rgraphviz
Imports  R.utils, methods, Biobase, parallel, edgeR, DESeq2, GenomicRanges, RBGL, DESeq, fields, limma, TeachingDemos, KEGGgraph, qgraph, clipper, AnnotationDbi, doParallel
Suggests  RUnit, BiocGenerics, gageData, DEGraph, plotrix, org.Hs.eg.db
LinkingTo  Rcpp
LazyData  yes
License  AGPL-3
biocViews  Software, GeneExpression, NetworkEnrichment, GraphAndNetwork, RNASeq, Visualization, Microarray, Pathways, DifferentialExpression,

NeedsCompilation  yes

ToPASeq-package

Package for topology-based pathway analysis of microarray and RNASeq data

Description

The package implements several methods for topology-based pathway analysis of microarray data. The methods present in here are: SPIA, TopologyGSA, DEGraph, Clipper, PWEA, TAPPA, TBS. SPIA, PWEA and TBS were also adapted for RNASeq data.

Details

Package: ToPASeq
Type: Package
Version: 1.0
Date: 2014-03-04
License: AGPL-3

AdjacencyMatrix2Pathway

Function to coerce an adjacency matrix to a Pathway

Description

The function coerces an adjacency matrix to a Pathway. Two types of matrices are allowed. The first one, where 1 denotes an edge between two nodes and 0 otherwise. This matrix is coerced into a simply pathway were type of all edges is set to “process”. The second type of adjacency matrix contains: 1 for an activation, -1 for an inhibition and 0 otherwise (=no edge between two nodes). In this case, activations are set to “process(activation)” and inhibition to “process(inhibition)”. The symetricity of the matrix is used to decide between directed and undirected graph. Symmetric matrix is expected for undirected graph and only the lower triangle of the matrix is used to extract the edges of the graph.

Usage

AdjacencyMatrix2Pathway(adjmat, name = "pathway", ident = "unknown", database = "unknown", species = ""

Arguments

adjmat An adjacency matrix describing the pathway topology
name  
A character, name of the pathway. Defaults to "pathway"

ident  
A character, type of the identifiers, e.g "gene symbol"

database  
A character, the name of the database the topology comes from

species  
A character, the species to which the topology belong

date  
A date, the date the topology was created

Value
An object of class Pathway, id is the same as title - name of the pathway

Author(s)
Ivana Ihnatova

Examples

genes<-paste("gene", 1:10, sep="")
adjmat<-matrix(sample(c(0,0,0,1), 100, TRUE),10,10, dimnames=list(genes,genes))
p<-AdjacencyMatrix2Pathway(adjmat)
head(edges(p))

adjmat<-matrix(sample(c(0,0,0,1,-1), 100, TRUE),10,10, dimnames=list(genes,genes))
p<-AdjacencyMatrix2Pathway(adjmat)
head(edges(p))

clipper  
Function to use clipper method on microarray or RNA-Seq data

Description
clipper is a method for topological gene set analysis. It implements a two-step empirical approach based on the exploitation of graph decomposition into a junction tree to reconstruct the most relevant signal path. In the first step clipper selects significant pathways according to statistical tests on the means and the concentration matrices of the graphs derived from pathway topologies. Then, it "clips" the whole pathway identifying the signal paths having the greatest association with a specific phenotype.

Usage
clipper(x, group, pathways, type, preparePaths=TRUE, norm.method=NULL, test.method=NULL, method="mean", both.directions=TRUE, maxNodes=150, minEdges=0, commonTh=2, filterSPIA=FALSE, convertTo="none", co
**Arguments**

- **x**
  An ExpressionSet object or a gene expression data matrix or count matrix, rows refer to genes, columns to samples.

- **group**
  Name or number of the phenoData column or a character vector or factor that contains required class assignments.

- **pathways**
  A list of pathways in a form from graphite package or created by `preparePathways()`.

- **type**
  Type of the input data, "MA" for microarray and "RNASeq" for RNA-Seq.

- **preparePaths**
  Logical, by default the pathways are transformed with `preparePathways()`. Use `FALSE`, if you have done this transformation separately.

- **norm.method**
  Character, the method to normalize RNAseq data. If `NULL` then TMM-normalization is performed. Possible values are: "TMM", "DESeq2", "rLog", "none".

- **test.method**
  Character, the method for differential expression analysis of RNAseq data. If `NULL` then "voomlimma" is used. Possible values are: "DESeq2", "voomlimma", "vstlimma", "edgeR". This analysis is needed only for the visualization.

- **method**
  Character, "mean" or "var", the kind of test to perform on the cliques.

- **testClique**
  Logical, if `TRUE` then the test is applied also on the cliques of the each pathway. It is a very time consuming calculation, especially for many or big pathways.

- **nperm**
  Number of permutations.

- **alphaV**
  Numeric, the threshold for variance test. The calculation of mean test depends on the result of variance test.

- **b**
  Number of permutations for mean analysis.

- **permute**
  Always performs permutations in the concentration matrix test. If `FALSE`, the test is made using the asymptotic distribution of the log-likelihood ratio. This option should be use only if samples size is >=40 per class.

- **both.directions**, **maxNodes**, **minEdges**, **commonTh**, **filterSPIA**, **convertTo**, **convertBy**
  Arguments for the `preparePathways()`.

**Value**

- **res**
  A list. First slot is a data frame containing p-values and q-values of mean and variance tests on pathways. The second slot is a list containing data.frames of the most affected paths in each pathway. The columns of the data frames contain: 1 - Index of the starting clique 2 - Index of the ending clique 3 - Index of the clique where the maximum value is reached 4 - length of the path 5 - maximum score of the path 6 - average score along the path 7 - percentage of path activation 8 - impact of the path on the entire pathway 9 - clique involved and significant 10 - clique forming the path 11 - genes forming the significant cliques 12 - genes forming the path.

- **topo.sig**
  If `testClique=TRUE`, a list where each slot contains the p-values and a list of cliques in one pathway. `NULL` otherwise.

- **degtest**
  A data.frame of gene-level differential expression statistics.
Note

If there are NA's only in columns 3 to 7, then a junction tree could not be formed.

preparePathways

Examples

```r
if (require(DEGraph)) {
  data("Loi2008_DEGraphVignette")
  pathways<-pathways("hsapiens","kegg")[[1]]
  clipper( exprLoi2008, classLoi2008, pathways,type="MA", convertTo="none")
}

## Not run:
if (require(gageData)) {
  data(hnrnp.cnts)
  hnrnp.cnts<-hnrnp.cnts[rowSums(hnrnp.cnts)>0,]
  group<-c(rep("sample",4), rep("control",4))
  pathways<-pathways("hsapiens","kegg")[[1:3]]
  clipper(hnrnp.cnts, group, pathways, type="RNASeq", norm.method="TMM", convertTo="none")
}
## End(Not run)
```

collectWeightsPRS  Function to calculate gene-level weights for topology-based pathway analysis

Description

The functions calculate gene-level weights defined in various topology-based pathway analysis methods (PRS, SPIA, PWEA). In PRS, it is the number of downstream differentially expressed genes. TIF, the statistic defined in PWEA, is related to the ratio of correlation and distance of genes. SPIA defines the so called net pertubation factors.
**Usage**

collectWeightsPRS(de, all, pathways)
collectWeightsSPIA(de, all, pathways)
prepareTIF(pathways, exprs, alpha)

**Arguments**

- **de**
  Named numeric vector, the log fold-changes of the differentially expressed genes

- **all**
  Character vector of all genes measured in the experiment

- **pathways**
  A list of pathways, each pathway is an object of class Pathway transformed via preparePathways() for the particular method

- **exprs**
  A numeric matrix, gene expression data matrix, rows refer to genes, columns to samples

- **alpha**
  Numeric, a threshold to control the magnitude. In TIF calculation, the effect of a gene on a few nearby and tightly correlated genes can be washed out if the gene influences many other genes weakly. The threshold suppresses this washing-out effect.

**Value**

A list, each slot is a vector of gene-level weights for one pathway

**Author(s)**

Ivana Ihnatova

**Examples**

```r
pathways <- pathways("hsapiens", "kegg")[[1:3]]
de <- setNames(rnorm(30), sample(nodes(pathways[[1]]), 30))
all <- nodes(pathways[[1]])

path <- preparePathways(pathways[[1:3]], method = "SPIA", genes = all, both.direction = TRUE, convertTo = "none")
collectWeightsSPIA(de, all, path)
```

---

**convertIdentifiersByVector**

*Function to convert identifiers in pathways by user specified vector*

**Description**

The function converts identifiers of nodes in a pathway. It uses the user specified named vector for the conversion.

**Usage**

convertIdentifiersByVector(pathway, conv.table, id.type = "unknown")
Arguments

pathway An object of class Pathway
conv.table A named vector in which names correspond to the identifiers present in the pathway and values are the new identifiers to which conversion happens
id.type A character, the type of the identifiers provided e.g. "TAIR" for TAIR numbers. This is for informative purposes only.

Value
A Pathway in which identifiers have been converted

Author(s)
Ivana Ihnatova

See Also
convertIdentifiers

Examples

g<-kegg["Asthma"]
conv<-setNames(paste("gene", 1:length(nodes(g)), sep=""), nodes(g))
gc<-convertIdentifiersByVector(g, conv, "dummy")
nodes(gc)
edges(gc)

DEGraph Function to use DEGraph method on microarray or RNA-Seq data

Description
DEGraph implements recent hypothesis testing methods which directly assess whether a particular gene network is differentially expressed between two conditions. It employs Graph Laplacian, Fourier transformation and multivariate T2-statistic

Usage
DEGraph(x, group, pathways, type, preparePaths=TRUE, norm.method=NULL, test.method=NULL, overall="big", both.directions=TRUE, maxNodes=150, minEdges=0, commonTh=2, filterSPIA=FALSE, convertTo="none", co
**Arguments**

- **x**: An ExpressionSet object or a gene expression data matrix or count matrix, rows refer to genes, columns to samples.
- **group**: Name or number of the phenoData column or a character vector or factor that contains required class assignments.
- **pathways**: A list of pathways in a form from graphite package or created by `preparePathways()`.
- **type**: Type of the data, "MA" for microarray and "RNASeq" for RNA-Seq.
- **preparePaths**: Logical, by default the pathways are transformed with `preparePathways()`. Use FALSE, if you have done this transformation separately.
- **norm.method**: Character, the method to normalize RNAseq data. If NULL then TMM-normalization is performed. Possible values are: "TMM", "DESeq2", "rLog", "none".
- **test.method**: Character, the method for differential expression analysis of RNAseq data. If NULL then "voomlimma" is used. Possible values are: "DESeq2", "voomlimma", "vstlimma", "edgeR". This analysis is needed only for the visualization.
- **overall**: Character, how should the overall p-value for a pathway be calculated. The possible values are: "mean", "min", "biggest". "biggest" returns the p-value of the biggest connected component.
- **useInteractionSigns**: Logical, should types of interaction be included in the analysis?
- **EdgeAttr**: A list containing two data.frames. See `makeDefaultEdgeData()` for the details. The interactions are assigned signs according to the beta column of the second data.frame. The procedure is similar to the SPIA method.

**Value**

A list:

- **res**: Results from analysis of individual pathways. The first column refers to the overall p-value for a pathway. Then groups of four columns follows. One group refers to one connected component and contains a pair of p-values (without and with Fourier transformation), graph and number of Fourier components used in the test. The number of groups is equal to the highest number of components in analysed pathways. Components are sorted in the decreasing order of their nodes number.
- **topo.sig**: NULL, present for the compatibility with outputs from other methods.
- **degtest**: A data.frame of gene-level statistics of all genes in the dataset.

**Author(s)**

Ivana Ihnatova

estimateCF

Function to estimate multi-subunit protein complexes and gene families in a pathway

Description

Function estimates the multi-subunit protein complexes and gene families in a pathway. A protein complex consists of proteins connected by undirected binding interaction. A gene family is a set of nodes with same outgoing and/or incoming edges.

Usage

estimateCF(graph)

Arguments

graph An object of class Pathway

Value

complexes A list of estimated protein complexes
families A list of estimated gene families

The function attempts to assign a representative name to each gene family. The representative name is a common part of the names of individual genes. This approach, however, may lead to ambiguities or missings. Then a general name in a form of family1, family2, etc. All the complexes are named analogously as complex1, complex2.

Author(s)
Ivana Ihnatova

See Also
reduceGraph

Examples
path <- pathways("hsapiens","kegg")[[1]]
estimateCF(path)

graphNEL2Pathway Function to coerce a graphNEL to a Pathway

Description
The function coerces a graphNEL to a Pathway. It attempts to recover the edge types from "edgeType" attribute of edgdata. The result contains only the edge types present in the graph. If the edgdata do not contain this attribute, then "process(indirect effect)" is used in order to preserve directionality.

Usage
graphNEL2Pathway(graph, name = "pathway", ident = "unknown", database = "unknown", species = "unknown", date = "unknown")

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>graph</td>
<td>A graphNEL object to be coerced.</td>
</tr>
<tr>
<td>name</td>
<td>A character, name of the pathway. Defaults to &quot;pathway&quot;</td>
</tr>
<tr>
<td>ident</td>
<td>A character, type of the identificators, e.g &quot;gene symbol&quot;</td>
</tr>
<tr>
<td>database</td>
<td>A character, the name of the database the topology comes from</td>
</tr>
<tr>
<td>species</td>
<td>A character, the species to which the topology belong</td>
</tr>
<tr>
<td>date</td>
<td>A date, the date the topology was created</td>
</tr>
</tbody>
</table>

Value
A coerced Pathway
Note
When this function is applied on x as reversed operation to pathwayGraph then the order of the edges may differ as well as the directionality of "process(indirect)" edges as they are set as undirected by graphNEL2Pathway.

Author(s)
Ivana Ihnatova

Examples
```r
c <- pathway("hsapiens","kegg")[[1]]
c <- pathwayGraph(c)
c <- graphNEL2Pathway(c)
set.seed(123)
rg <- randomEGraph(LETTERS[1:20], edges = 30)
p <- graphNEL2Pathway(rg)
head(edges(p))
```

---

### KEGG2Pathway

**Function to parse KEGG KGML file into a Pathway**

#### Description
The function parses a KGML file from KEGG into a Pathway.

#### Usage
```r
KEGG2Pathway(file, expandGenes = TRUE, expandCom = TRUE, nongene = c("keep", "propagate", "discard"),
ident = )
```

#### Arguments
- **file**: Character, the name of the file to be parsed. Download manually or in bulk from KEGG.
- **expandGenes**: Logical, should multi-gene nodes be expanded into separate nodes?
- **expandCom**: Logical, should undirected binding interactions be added between nodes from one group (usually multi-subunit protein complex, which is turned into a clique).
- **nongene**: Character, how should be the non-gene nodes parsed? If "discard" they are removed from the pathway. If "propagate", they are removed but the interactions are preserved (e.g. if gene A interacts with compound c and compound c interacts with gene B, then the interaction between A and B is preserved. Otherwise, they are kept in the pathway topology.
- **ident**: Character, the type of the node identifiers.
**makeDefaultEdgeData**

<table>
<thead>
<tr>
<th>database</th>
<th>Character, the name of the database</th>
</tr>
</thead>
<tbody>
<tr>
<td>species</td>
<td>Character, the three-letter code for the species-specific pathways. If NULL then, the first 3 letters from the file are used.</td>
</tr>
</tbody>
</table>

**Value**

A Pathway

**Author(s)**

Ivana Ihnatova

---

The function **makeDefaultEdgeData** creates auxiliary data needed for SPIA method.

**Description**

This function creates a list containing auxiliary data needed in SPIA method for conversion between edge types and dividing interaction into three categories: positive, negative and neutral.

**Usage**

```r
makeDefaultEdgeData()
```

**Details**

The first slot called `graphite2SPIA` contains a mapping table between edge types in topologies from graphite and edge types which are used in the implementation of SPIA in the `spia` package. All of the edge types present in the topologies must be also covered by this table otherwise the method could not be applied.

The second slot called `beta` divides the 25 interaction types into three categories: positive (beta=1), negative (beta=-1) and neutral (beta=0) in the sense of gene regulation. Only user familiar with all the details of SPIA should change this.

**Value**

A list of two data frames explained in the **Details**

**Examples**

```r
str(makeDefaultEdgeData())
```
Description

This class represents a biological pathway. `changeInteraction` and `changeDirection` are a new generic function designed for `Pathway` class

Methods

```r
edges signature(object = "Pathway"): retrieves the data.frame describing the pathway edges.

nodes signature(object = "Pathway"): retrieves the vector enumerating the identifiers of the pathway nodes.
```

The methods below perform basic topological analysis of a pathway. They were defined as generic in `graph` for `graph` class. They were implemented for `Pathway` in this package

```r
degree signature(object = "Pathway", Nodes = "character") Returns the number of incoming or outgoing edges for nodes in Nodes

degree signature(object = "Pathway", Nodes = "missing") Returns the number of incoming or outgoing edges for all nodes in object

numNoEdges signature(objGraph = "Pathway") Returns the number of nodes without any edge

mostEdges signature(objGraph = "Pathway") Returns the nodes with most edges

acc signature(object = "Pathway", index = "character") Returns the set of nodes accessible from nodes in index. The undirected edges are considered as bidirected (directed in both directions)

connComp signature(object = "Pathway") Returns the connected components present in a pathway. They are returned as list where each slot refers to one component and contains the relevant nodes. The undirected edges are considered as bidirected (directed in both directions)

edges signature(object = "Pathway", which = "character") Returns the edges relevant to node(s) in which

isAdjacent signature(object = "Pathway", from = "character", to = "character") Returns whether nodes in from and to are adjacent (there is an edge starting in from and ending in to

isConnected signature(object = "Pathway") Returns TRUE if a pathway contains only one connected component

isDirected signature(object = "Pathway") Returns TRUE if all edges in a pathway are directed

edgemode signature(object = "Pathway") Returns the type of edges in a pathway: directed, undirected or both

numEdges signature(object = "Pathway") Returns the number of edges in a pathway

numNodes signature(object = "Pathway") Returns the number of nodes in a pathway

edgeNames signature(object = "Pathway") Returns the names of the edges in a following format: starting node ~ ending node
```
preparePathways

Function to prepare pathways for topology-based pathway analysis

Description

Functions transforms pathways from graphite package (stored as Pathway-class) into formats required in the particular topology-based method implemented in this package. It also converts identifiers in the pathways and filters pathways according to several criteria.

Usage

preparePathways(pathways, method, both.directions, genes, maxNodes = 150, minEdges = 0, commonTh = 2, convertto = "entrez", convertby = NULL, edgeattrs = NULL)

Arguments

pathways A list of pathways, individual pathways are objects of class Pathway stored in PathwayList
method A character, the pathways will be transformed according to the needs of the particular method. Possible values are: "TAPPA", "PRS", "PWEA", "TopologyGSA", "clipper", "DEGraph"
both.directions Logical, indicates how should be the undirected edges directed. If TRUE, an undirected edge is substituted with two directed edges with opposite directions (e.g. A-B becomes A->B and B->A). If FALSE, then an undirected edge is substituted with one directed edge which preserves the order of nodes (e.g. A-B becomes A->B).

genes Character vector, vector of gene identifiers in the expression data

maxNodes Numeric, maximal number of nodes. Pathways with more nodes are filtered out.

minEdges Numeric, minimal number of edges. Pathways with less edges are filtered out.

commonTh Numeric, threshold for number of nodes present in the data. Pathways with less node-identifiers matching to genes are filtered out.

filterSPIA Logical, if TRUE applies filter defined in the SPIA method (relates to the calculation of inversion matrix).

convertTo Character. If "none" no conversion is performed. Otherwise, the function converts node-identifiers in pathways as in graphite. It uses annotation package for the mapping.

convertBy Named character vector, names of the element must match the node-identifiers and the values are the new identifiers to be replaced. This is a more general option designed for pathways outside graphite.

EdgeAttrs A list of two tables required for the filter from SPIA method. See makeDefaultEdgeData for the details.

Value A list of the transformed pathways

Author(s) Ivana Ihnatova

Examples

#Creating dummy set of genes
set.seed(123)
pathways<-pathways("hsapiens","kegg")[1:3]

genes<unnname(unlist(lapply(pathways[1:3], nodes)))
genesisample(genes, length(genes)*0.9)

#Applying the function
paths<-preparePathways(pathways[1:3], "TAPPA", TRUE, genes, maxNodes=65, convertTo="none")
paths
Function to use PRS method on microarray or RNA-Seq data

Description

A function runs PRS method on a gene expression data matrix or count matrix and vector dividing samples into two groups and a set of pathways from graphite package. The PRS method (please see Reference for the details) was adapted to graphite’s graphs where each node is represented only by one gene.

Usage

Arguments

x An ExpressionSet object or a gene expression data matrix or count matrix, rows refer to genes, columns to samples

group Name or number of the phenoData column or a character vector or factor that contains required class assignments

pathways A list of pathways in a form from graphite package or created by preparepathways()

type Type of the data, "MA" for microarray, "RNASeq" for RNA-Seq, DEtable data.frame from differential expression analysis, or DEGlist a list of: log fold-changes of differentially expressed genes and names of the all genes analyses

preparePaths Logical, by default the pathways are transformed with preparePathways(). Use false, if you have done this transformation separately

normNmethod Character, the method to normalize RNAseq data. If NULL then TMM-normalization is performed. Possible values are: "TMM", "DESeq2", "rLog", "none". Ignored for type: "MA","DEtable", "DElist"

testNmethod Character, the method for differential expression analysis of RNAseq data. If NULL then "voomlimma" is used. Possible values are: "DESeq2", "voomlimma", "vstlimma", "edgeR". Ignored for type: "MA","DEtable", "DElist"

pNth Numeric, threshold for p-values of tests for differential expression of genes. Use 1 if you don’t want any threshold to be applied

logfcNth Numeric, threshold for log fold-change of a gene to identify the gene as differentially expressed. Use negative if you don’t want any threshold to be applied

nperm Numeric, number of permutations

bothNdirections, maxNodes, minEdges, commonTh, filterSPIA, convertTo, convertBy Arguments for the preparePathways()
Value

- **res**: A data frame with normalized score, p-value and FDR-adjusted p-value for each pathway.
- **topo.sig**: A list with log fold-changes and number of downstream differentially expressed nodes for nodes of individual pathways.
- **degtest**: A named vector of statistics from testing the differential expression of genes.

}
```

```r
# Not run:
if (require(gageData)) {

data(hnrnp.cnts)
  hnrnp.cnts<-hnrnp.cnts[rowSums(hnrnp.cnts)>0,]
  group<-c(rep("sample",4), rep("control",4))
  pathways<-pathways("hsapiens","biocarta")[1:10]
  PRS(hnrnp.cnts, group, pathways, type="RNASeq", logFC.th=-1, nperm=100, test="vstlimma")
}
```

```r
# End(Not run)
```
Function to use PWEA method on microarray or RNA-Seq data

Description

The function runs PWEA method (please see References for the details) on gene expression data matrix, vector specifying to which group a sample belongs and a list of pathway graphs. Briefly, it is a weighted GSEA-like method. The weightes are based on the distance and Pearson’s correlation between genes in a pathway.

Usage

PWEA(x, group, pathways, type, preparePaths=TRUE, norm.method=NULL, test.method=NULL, tif=NULL, alpha, both.directions=TRUE, maxNodes=150, minEdges=0, commonTh=2, filterSPIA=FALSE, convertTo="none", convertBy="none")

Arguments

x An ExpressionSet object or a gene expression data matrix or count matrix, rows refer to genes, columns to samples. Or a list of two data.frames: observed and random (after group permutations) of statistics of differential expression of genes

group Name or number of the phenoData column or a character vector or factor that contains required class assigments

pathways A list of pathways in a form from graphite package or created by preparepathways()

type Type of the data, "MA" for microarray, "RNASeq" for RNA-Seq or "Detable" for a list of observed and random gene-level statistics

preparePaths Logical, by default the pathways are transformed with preparepathways(). Use FALSE, if you have done this transformation separately

norm.method Character, the method to normalize RNAseq data. If NULL then TMM-normalization is performed. Possible values are: "TMM", "DESeq2", "rLog", "none"

test.method Character, the method for differential expression analysis of RNAseq data. If NULL then "voomlimma" is used. Possible values are: "DESeq2", "voomlimma", "vstlimma", "edgeR"

tif A list of Topology Influence Factor's. One slot refers to one pathway. Use prepareTIF() to create it. It is required only if type="Detable"

alpha Numeric, a threshold value used during TIF calculation

nperm Numeric, number of permutations. Used only if x %in% c("MA", "RNASeq")

ncores Numeric, number of cores. Used only if x %in% c("MA", "RNASeq"). The permutations are calculated in parallel way

both.directions, maxNodes, minEdges, commonTh, filterSPIA, convertTo, convertBy Arguments for the preparePathways()
Value

A list

res                  A data frame, rows refer to pathways. It contains: Enrichment score for a pathway, p-value and p-value adjusted for multiple hypothesis testing by Benjamini-Hochberg’s FDR method. NA's if less than 2 nodes are present in the data

topo.sig            A list, topology influence factors for the genes in individual pathways. NULL if less than 2 nodes are present in the data

degtest             A named vector of statistics from testing the differential expression

## End(Not run)
**reduceGraph**  
*Function to reduce the pathway graph*

---

### Description

Function simplifies a pathway graph topology. It merges a user specified nodes into a one. The specified set of nodes must be either a gene family or a protein complex. By a gene family we mean a set of genes with same outgoing or incoming edges. On the other hand, a protein complex is a set of nodes with only undirected binding edges between them and the number of edges is equal to the complex size.

### Usage

```r
reduceGraph(graph, reduction)
```

### Arguments

- `graph`  
  An object of class `pathway`, a pathway to be reduced

- `reduction`  
  A named list of reductions to be made.

### Value

A `pathway`

### Author(s)

Ivana Ihnatova

### Examples

```r
cp <- convertIdentifiers(pathways[[1]], "SBID")
cp <- as(cp, "pathway")
cp <- reduceGraph(cp, list("RAS", "KRAS", "HRAS"))
cp <- convertIdentifiers(cp, c("SHC1", "SHC4", "SHC2", "SHC3"))
# this throws an error, "RELA", "FOS", "NFKB1" is not correct set of genes
```
pathways<-convertIdentifiers(pathways[[1]], "SYMBOL")

gr<-convertIdentifiers(kegg[["Prolactin signaling pathway"]],"SYMBOL")
red<-list(RAS=c("NRAS","KRAS","HRAS"), SHC=c("RELA","FOS","NFKB1"))
reduced<-reduceGraph(pathways, red)

## End(Not run)

---

**res**  
*Function to extract parts of object*

**Description**

Function extracts part of an object named "res", "topo.sig", "degtable"

**Usage**

res(object)  
topo.sig(object)  
degtable(object)

**Arguments**

object  
Object of defined class. Methods for topResult are available in this package

**Value**

Extracted parts of an object. Data type varies between parts and the origin of the object

**Author(s)**

Ivana Ihnatova

---

**SPIA**  
*Function to use SPIA method on microarray or RNA-Seq data*

**Description**

The function runs SPIA method on microarray or RNA-Seq data. The implementation includes the identification of differentially expressed genes and transformation of pathways’ topologies to an appropriate form. The SPIA method combines two independent p-values. One p-value comes from overrepresentation analysis and the other is so called perturbation factor.
Usage
SPIA(x, group, pathways, type, preparePaths=TRUE, norm.method=NULL, test.method=NULL, p.th=0.05, logFcth=0, both.directions=TRUE, maxNodes=150, minEdges=0, commonTh=2, filterSPIA=FALSE, convertTo="none", convertBy=NULL)

Arguments

x An ExpressionSet object or a gene expression data matrix or count matrix, rows refer to genes, columns to samples

Group Name or number of the phenoData column or a character vector or factor that contains required class assignments

Pathways A list of pathways in a form from graphite package or created by preparePathways()

Type Type of the data, "MA" for microarray, "RNASeq" for RNA-Seq, DEtable data.frame from differential expression analysis, or DEGlist a list of: log fold-changes of differentially expressed genes and names of the all genes analyses

PreparePaths Logical, by default the pathways are transformed with preparePathways(). Use FALSE, if you have done this transformation separately

Norm.method Character, the method to normalize RNASeq data. If NULL then TMM-normalization is performed. Possible values are: "TMM", "DEseq2", "rLog", "none". Ignored for type: "MA", "DEtable", "DElist"

Test.method Character, the method for differential expression analysis of RNASeq data. If NULL then "voomlimma" is used. Possible values are: "DEseq2", "voomlimma", "vstlimma", "edgeR", Ignored for type: "MA", "DEtable", "DElist"

P.th Numeric, threshold for p-values of tests for differential expression of genes. Use 1 if you don't want any threshold to be applied

LogFC.th Numeric, threshold for log fold-change of a gene to identify the gene as differentially expressed. Use negative if you don't want any threshold to be applied

Nperm Numeric, number of permutations

Combine Character, the method to combine p-values. Defaults to "fisher" for Fisher's method. The other possible value is "norminv" for the normal inversion method.

Both.directions, maxNodes, minEdges, commonTh, filterSPIA, convertTo, convertBy Arguments for the preparePathways()

Value
A list:

Res A matrix with columns as described below: pSize - Pathway size, number of genes, NDE - Number of differentially expressed genes, pNDE - P-value of the overrepresentation part of the method, tA - The observed total perturbation accumulation in the pathway, pPERT - P-value of the perturbation part of the method, p - Combined p-value (overrepresentation and perturbation), pFdr - False discovery rate adjusted p, pFWER - FWER adjusted p, Status - If a pathway was identified as Activated or Inhibited

Topo.sig A list of accumulated perturbation factors and log fold-changes for genes in individual pathways

Degtest A numeric vector of gene-level differential expression statistics of all genes in the dataset
TAPPA

Function to use TAPPA method on microarray or RNA-Seq data

Description

The function analyses the differential expression of pathways via TAPPA method. Expression is compared between two groups of samples by Mann-Whitney test. P-values are later adjusted for multiple hypothesis testing by Benjamini-Hochberg’s FDR method.

preparePathways

Examples

```r
if (require(DEGraph)) {
  data("Loi2008_DEGraphVignette")
  pathways<-pathways("hsapiens","biocarta")[1:10]  
  SPIA(exprLoi2008, classLoi2008,pathways, type="MA", logFC.th=-1)
}
## Not run:
if (require(gageData)) {
  data(hnrrnp.cnts)
  hnrrnp.cnts<-hnrrnp.cnts[rowSums(hnrrnp.cnts)>0,]
  group<-c(rep("sample",4), rep("control",4))
  pathways<-pathways("hsapiens","biocarta")[1:10]  
  SPIA(hnrrnp.cnts, group, pathways, type="RNASeq", logFC.th=-1, IDs="entrez", test="vstlimma")
}
## End(Not run)
```
TAPPA

Usage

TAPPA(x, group, pathways, type, preparePaths=TRUE, norm.method=NULL, test.method=NULL, test=t.test, n.test=NULL, test.method=NULL, maxNodes=150, minEdges=0, commonTh=2, filterSPIA=FALSE, convertTo="none", convertBy=NULL)

Arguments

x  An ExpressionSet object or a gene expression data matrix or count matrix, rows refer to genes, columns to samples

group  Name or number of the phenoData column or a character vector or factor that contains required class assignments

pathways  A list of pathways in a form from graphite package or created by preparePathways()

type  Type of the input data, "MA" for microarray and "RNASeq" for RNA-Seq

preparePaths  Logical, by default the pathways are transformed with preparePathways(). Use FALSE, if you have done this transformation separately

norm.method  Character, the method to normalize RNAseq data. If NULL then TMM-normalization is performed. Possible values are: "TMM", "DESeq2", "rLog", "none"

test.method  Character, the method for differential expression analysis of RNAseq data. If NULL then "voomlimma" is used. Possible values are: "DESeq2", "voomlimma", "vstlimma", "edgeR". This analysis is needed only for the visualization.

test  Function implementing a statistical test comparing PCI scores between groups. It is employed as test(PCI~group)$p.value, where PCI is a numeric vector of the same length as group

normalize  Logical, should data be normalized?

verbose  Logical, if TRUE names of the pathways are printed as they are analysed

both.directions, maxNodes, minEdges, commonTh, filterSPIA, convertTo, convertBy Arguments for the preparePathways()

Value

A list,

res  A data frame, rows refer to pathways. Columns contain: number of valid PCI-scores, median, min and max of the PCI scores for each group of samples, p-value of the test (p.val) and adjusted p-value (p.adj). If less than two nodes are present in the data, the function puts NA's in all columns.

topo.sig  NULL, it is preserved for the compatibility with other methods implemented in this package

degtest  A numeric vector of gene-level differential expression statistics

  TAPPA( hnrnp.cnts, group, pathways, type="RNASeq", norm.method="TMM")
}

## End(Not run)
```

ToPASeq-deprecated

**Deprecated functions in package ‘ToPASeq’**

Description

These functions are provided for compatibility with older versions of ‘ToPASeq’ only, and will be defunct at the next release.

Details

The following functions are deprecated and will be made defunct; use the replacement indicated below:

- AdjacencyMatrix2pathway: `AdjacencyMatrix2Pathway`
- graphNEL2pathway: `graphNEL2Pathway`
- KEGG2pathway: `KEGG2Pathway`
Function to use TopologyGSA method on microarray or RNA-Seq data

Description

TopologyGSA method uses graphical models to test the differential expression of a pathway. It also highlights pathway components involved in the deregulation.

Usage

TopologyGSA(x, group, pathways, type, preparePaths=TRUE, norm.method=NULL, test.method=NULL, method=both.directions=TRUE, maxNodes=150, minEdges=0, commonTh=2, filterSPIA=FALSE, convertTo="none", conf=0.95)

Arguments

x An ExpressionSet object or a gene expression data matrix or count matrix, rows refer to genes, columns to samples

group Name or number of the phenoData column or a character vector or factor that contains required class assignments

pathways A list of pathways in a form from graphite package or created by preparePathways()

type Type of the input data, "MA" for microarray and "RNASeq" for RNA-Seq

preparePaths Logical, by default the pathways are transformed with preparePathways(). Use FALSE, if you have done this transformation separately

norm.method Character, the method to normalize RNAseq data. If NULL then TMM-normalization is performed. Possible values are: "TMM", "DESeq2", "rLog", "none"

test.method Character, the method for differential expression analysis of RNAseq data. If NULL then "voomlimma" is used. Possible values are: "DESeq2", "voomlimma", "vstlimma", "edgeR". This analysis is needed only for the visualization.

method Either "var" and "mean". Determine the type of test used by topologyGSA.

alpha Numeric, threshold for statistical significance of variance test. It influences the method for the mean test

testClique Logical, if TRUE, then the test is also performed on individual cliques. It can be very computationally complex.

... Other arguments to be passed to the method. See details for better explanation

both.directions, maxNodes, minEdges, commonTh, filterSPIA, convertTo, convertBy Arguments for the preparePathways()

Details

The method requires a Directed Acyclic Graph (DAG). Therefore if a pathway contain also undirected or bidirected edges and error is thrown.

The user can further specify for the mean test:

1. **perms** number of permutations of the test,
2. **paired** logical flag. If TRUE Hotelling test for paired samples is calculated and the test on the variances is not performed.

Or for the variance test:

1. **variance** logical flag. If TRUE the estimates of the covariance matrices are included in the result.
2. **s1** First group covariance matrix estimation.
3. **s2** Second group covariance matrix estimation.

**Value**

A list

- **res** a list with one entry for each successfully analyzed pathway
- **topo.sig** if `testcliques=TRUE`, a list where each slot contains the pvalues and a list of cliques in one pathway. NULL otherwise
- **degtest** A numeric vector of gene-level differential expression statistics
