Package ‘bioDist’

March 22, 2017

Title  Different distance measures
Version  1.46.0
Author  B. Ding, R. Gentleman and Vincent Carey
Description  A collection of software tools for calculating distance measures.
Maintainer  Bioconductor Package Maintainer
            <maintainer@bioconductor.org>
License  Artistic-2.0
Depends  R (>= 2.0), methods, Biobase,KernSmooth
Suggests  locfit
biocViews  Clustering, Classification
NeedsCompilation  no

Index

closest.top  Find the closest genes.

Description

Find the closest genes to the supplied target gene based on the supplied distances.
Usage

closest.top(x, dist.mat, top)

Arguments

- **x**: the name of the gene (feature) to use.
- **dist.mat**: either a dist object or a matrix of distances.
- **top**: the number of closest genes desired.

Details

The feature named `x` must be in the supplied distances. If so, then the `top` closest other features are returned.

Value

A vector of names of the top closest features.

Author(s)

Beiying Ding

See Also

cor.dist, spearman.dist, tau.dist, euc, man, KLdist.matrix, KLD.matrix, mutualInfo

Examples

data(sample.ExpressionSet)
sE <- sample.ExpressionSet[1:100,]
d1 <- KLdist.matrix(sE, sample = FALSE)
closest.top(featureNames(sE)[1], d1, 5)

---

**cor.dist**

*Pearson correlational distance*

Description

Calculate pairwise Pearson correlational distances, i.e. 1-COR or 1-|COR|, and saves as a ‘dist’ object

Usage

cor.dist(x, ...)

---
euc

Arguments

x  n by p matrix or ExpressionSet; if x is an ExpressionSet, then the function uses its 'exprs' slot.

...  arguments passed to cor.dist:

  • absif TRUE, then 1-|COR| else 1-COR, default is TRUE.
  • diagif TRUE, then the diagonal of the distance matrix will be displayed, default is FALSE.
  • upperif TRUE, then the upper triangle of the distance matrix will be displayed, default is FALSE.
  • samplefor objects of classes that extend eSet: if TRUE, then distances are computed between samples(columns), otherwise, they are computed between features(rows).

Details

The cor function is used to compute the pairwise distances between rows of an input matrix, except if the input is an object of a class that extends eSet and sample is TRUE.

Value

Pairwise Pearson correlational distance object

Author(s)

Beiying Ding

See Also

spearman.dist, tau.dist, euc, man, KLdist.matrix, KLD.matrix, mutualInfo

Examples

x <- matrix(rnorm(200), nrow = 5)
cor.dist(x)
KLD.matrix

Arguments

x n by p matrix or an object of a class that extends eSet; if x is a matrix, pairwise distances are calculated between the rows of a matrix. If x is an object of a class that extends eSet, the method makes use of the `exprs` method and pairwise distances are calculated between samples(columns) if `sample` is TRUE.

... arguments passed to `euc`:

- `diag` if TRUE, then the diagonal of the distance matrix will be displayed; default is FALSE.
- `upper` if TRUE, then the upper triangle of the distance matrix will be displayed; default is FALSE.
- `sample` For objects of classes that extends eSet, pairwise distances are calculated between samples(columns) if `sample` is TRUE; default value is TRUE.

Details

The method calculates pairwise euclidean distances, assuming that all samples have the same number of observations.

Value

An object of class `dist` with the pairwise Euclidean distance between rows except in case of objects of class that extend eSet when `sample` is TRUE.

Author(s)

Beiying Ding

Examples

```r
x <- matrix(rnorm(200), nrow = 5)
euc(x)
```

---

KLD.matrix

Continuous version of Kullback-Leibler Distance (KLD)

Description

Calculate KLD by estimating by smoothing \( \log(f(x)/g(x)) \ast f(x) \) and then integrating.

Usage

```r
KLD.matrix(x, ...)
```
Arguments

\( x \)

An \( n \) by \( p \) matrix or list or an object of a class that extends eSet; if \( x \) is an object of a class that extends eSet (e.g., ExpressionSet), then the function works against its 'exprs' slot.

Arguments passed to KLD.matrix:

- `method`: use locfit or density to estimate integrand; default is c("locfit", "density") (i.e., both methods).
- `supp`: upper and lower limits of the integral; default is NULL in which case the limits of the integral are calculated from the range of the data.
- `subdivision`: subdivisions for the integration; default is 1000.
- `diag`: if TRUE, then the diagonal of the distance matrix will be displayed; default is FALSE.
- `upper`: if TRUE, then the upper triangle of the distance matrix will be displayed; default is FALSE.
- `sample`: for ExpressionSet methods: if TRUE, then distances are computed between samples, otherwise, they are computed between genes.

Details

The distance is computed between rows of the input matrix (except if the input is an object of a class that extends eSet and `sample` is TRUE).

The presumption is that all samples have the same number of observations. The list method is meant for use when samples sizes are unequal.

Value

An object of class `dist` with the pairwise, between rows, Kullback-Leibler distances.

Author(s)

Beiying Ding, Vincent Carey

See Also

cor.dist, spearman.dist, tau.dist, dist, KLdist.matrix, mutualInfo

Examples

```r
x <- matrix(rnorm(100), nrow = 5)
KLD.matrix(x, method = "locfit", supp = range(x))
```

KLDist.matriX

Discrete version of Kullback-Leibler Distance (KLD)

Description

Calculate the KLD by binning continuous data.

KL distance is calculated using the formula

\[
KLD(f_1(x), f_2(x)) = \sum_{i=1}^{N} f_1(x_i) \times \log \frac{f_1(x_i)}{f_2(x_i)}
\]
KLdist.matrix

Usage

KLdist.matrix(x, ...)

Arguments

x   n by p matrix or a list or an object of a class that extends eSet. If x is an object of
     a class derived from eSet (ExpressionSet, SnpSet etc), then the values returned
     by the exprs function are used.

... arguments passed to KLdist.matrix:

  gridsize  the number of grid points used to select the optimal bin width of the
            histogram used to estimate density. If no value is supplied, the grid size is
            calculated internally; default is NULL.

  symmetrize if TRUE, then symmetrize; the default is FALSE.

  diag    if TRUE, then the diagonal of the distance matrix will be displayed; the
           default is FALSE.

  upper   if TRUE, then the upper triangle of the distance matrix will be displayed;
           default is FALSE.

  sample  for eSet methods: if TRUE, then the distances are computed between
           samples, otherwise, between features; the default is TRUE.

Details

The data are binned, and then the KL distance between the two discrete distributions is computed
and used. The distance is computed between rows of the input matrix (except if the input is an
object of a class that extends eSet and sample is TRUE).

The presumption is that all samples have the same number of observations. The list method is meant
for use when samples sizes are unequal.

Value

An object of class dist is returned.

cor.dist, spearman.dist, tau.dist.euc, man.KLD.matrix, mutualInfo

Examples

x <- matrix(rnorm(100), nrow = 5)
KLdist.matrix(x, symmetrize = TRUE)
Description

Calculate pairwise Manhattan distances and saves as a dist object.

Usage

\texttt{man(x, \ldots)}

Arguments

\texttt{x} \quad \text{n by p matrix or an object of class that extends eSet. If x is an object of class that extends eSet, (eg ExpressionSet) then the function uses its 'exprs' slot.}

\texttt{\ldots} \quad \text{arguments passed to man:}

\begin{itemize}
  \item \texttt{diagif TRUE}, then the diagonal of the distance matrix will be displayed; default is FALSE.
  \item \texttt{upperif TRUE}, then the upper triangle of the distance matrix will be displayed; default is FALSE.
\end{itemize}

Details

This is just an interface to dist with the right parameters set.

Value

An instance of the dist class with the pairwise Manhattan distances between the rows of \texttt{x} in case of a matrix or between the features (rows) in case of a class that extends eSet.

Examples

\begin{verbatim}
  x <- matrix(rnorm(200), nrow = 5)
  man(x)
\end{verbatim}
mutualInfo  Mutual Information

Description
Calculate mutual information via binning

Usage
mutualInfo(x, ...)
MIdist(x, ...)

Arguments

x
an n by p matrix or ExpressionSet; if x is an ExpressionSet, then the function uses its 'exprs' slot.

... arguments passed to mutualInfo and MIdist:

• nbinnumber of bins to calculate discrete probabilities; default is 10.
• diagif TRUE, then the diagonal of the distance matrix will be displayed; default is FALSE.
• upperif TRUE, then the upper triangle of the distance matrix will be displayed; default is FALSE.
• samplefor ExpressionSet methods, if TRUE, then distances are computed between samples, otherwise, between genes.

Details
For mutualInfo each row of x is divided into nbins groups and then the mutual information is computed, treating the data as if they were discrete.

For MIdist we use the transformation proposed by Joe (1989), \( \delta^* = (1 - \exp(-2\delta))^{1/2} \) where \( \delta \) is the mutual information. The MIdist is then \( 1 = \delta^* \). Joe argues that this measure is then similar to Kendall’s tau, tau.dist.

Value
An object of class dist which contains the pairwise distances.

Author(s)
Robert Gentleman

Examples

```r
x <- matrix(rnorm(100), nrow = 5)
mutualInfo(x, nbin = 2)
```

---

**Spearman correlational distance**

Description

Calculate pairwise Spearman correlational distances, i.e. 1-SPEAR or 1-|SPEAR|, for all rows of a matrix and return a dist object.

Usage

```r
spearman.dist(x, ...)
```

Arguments

- `x`: n by p matrix or ExpressionSet; if x is an ExpressionSet, then the function uses its 'exprs' slot.
- `...`: arguments passed to `spearman.dist`:
  - `absif` TRUE, then 1-|SPEAR| else 1-SPEAR; default is TRUE.
  - `diagif` TRUE, then the diagonal of the distance matrix will be displayed; default is FALSE.
  - `upperif` TRUE, then the upper triangle of the distance matrix will be displayed; default is FALSE.
  - `samplefor the ExpressionSet method: if TRUE (the default), then distances are computed between samples.

Details

We call `cor` with the appropriate arguments to compute the row-wise correlations.

Value

One minus the Spearman correlation, between rows of x, are returned, as an instance of the dist class.

Examples

```r
x <- matrix(rnorm(200), nrow = 5)
spearman.dist(x)
```
tau.dist

Kendall’s tau correlational distance

Description

Calculate pairwise Kendall’s tau correlational distances, i.e. 1-TAU or 1-|TAU|, for all rows of the input matrix and return an instance of the dist class.

Usage

tau.dist(x, ...)

Arguments

x

n by p matrix or ExpressionSet; if x is an ExpressionSet, then the function uses its ‘exprs’ slot.

... arguments passed to tau.dist:

• absif TRUE, then 1-|TAU| else 1-TAU; default is TRUE.
• diagif TRUE, then the diagonal of the distance matrix will be displayed; default is FALSE.
• upperif TRUE, then the upper triangle of the distance matrix will be displayed; default is FALSE.
• samplefor the ExpressionSet method: if TRUE (the default), then distances are computed between samples.

Details

Row-wise correlations are computed by calling the cor function with the appropriate arguments.

Value

One minus the row-wise Kendall’s tau correlations are returned as an instance of the dist class. Note that this can be extremely slow for large data sets.
