Package ‘blima’

March 22, 2017

Type Package

Title Package for the preprocessing and analysis of the Illumina microarrays on the detector (bead) level.

Version 1.8.0

Date 2015-04-01

Author Vojtech Kulvait

Maintainer Vojtech Kulvait <kulvait@gmail.com>

Description Package blima includes several algorithms for the preprocessing of Illumina microarray data. It focuses to the bead level analysis and provides novel approach to the quantile normalization of the vectors of unequal lengths. It provides variety of the methods for background correction including background subtraction, RMA like convolution and background outlier removal. It also implements variance stabilizing transformation on the bead level. There are also implemented methods for data summarization. It also provides the methods for performing T-tests on the detector (bead) level and on the probe level for differential expression testing.

blima-package

Package for the preprocessing and analysis of the Illumina microarrays on the detector (bead) level.

Description

Package blima includes several algorithms for the preprocessing of Illumina microarray data. It focuses to the bead level analysis and provides novel approach to the quantile normalization of the vectors of unequal lengths. It provides variety of the methods for background correction including background subtraction, RMA like convolution and background outlier removal. It also implements variance stabilizing transformation on the bead level. There are also implemented methods for data summarization. It also provides the methods for performing T-tests on the detector (bead) level and on the probe level for differential expression testing.
aggregateAndPreprocess

Aggregate data

Description

This function is not intended to direct use. It helps perform work of doProbeTTests function. For each probe it prints mean and sd of an quality.

Usage

aggregateAndPreprocess(x, quality = "qua", transformation = NULL)

Arguments

- x: Two column matrix to aggregate with columns "ProbeID" and quality.
- quality: Quality to analyze, default is "qua".
- transformation: Function of input data trasformation, default is NULL. Any function which for input value returns transformed value may be supplied. T-test then will be evaluated on transformed data, consider use log2TranformPositive.

Author(s)

Vojtech Kulvait
bacgroundCorrect

Data background correction.

Description

Background correction procedure selecting beads with background Intensity $I_b \text{mean} - I_b \lvert > k \times SD(I_{bs})$ for exclusion.

Usage

bacgroundCorrect(b, normalizationMod = NULL, channelBackground = "GrnB", k = 3, channelBackgroundFilter = "bgf", channelAndVector = NULL)

Arguments

- **b**: List of beadLevelData objects (or single object).
- **normalizationMod**: NULL for normalization of all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b or list of such vectors if b is a list of beadLevelData classes.
- **channelBackground**: Name of channel to normalize.
- **k**: Parameter of method stringency (default is 3).
- **channelBackgroundFilter**: Filtered beads will have weight 0 and non filtered weight 1.
- **channelAndVector**: Represents vector to bitwise multiple to the channelBackgroundFilter vector.

Author(s)

Vojtech Kulvait

Examples

if(require("blimaTestingData") && interactive())
{
  #To perform background correction on blimatesting object for two groups. Background correction is followed by correction for non positive data
  data(blimatesting)
  #Prepare logical vectors corresponding to conditions A and E.
  groups1 = "A";
  groups2 = "E";
  sampleNames = list()
  c = list()
  for(i in 1:length(blimatesting))
  {
    p = pData(blimatesting[[i]]@experimentData$phenoData)
    c[[i]] = p$Group %in% c(groups1, groups2);
    sampleNames[[i]] = p$Name
  }
  #Background correction and quantile normalization followed by testing including log2TransformPositive transformation.
  blimatesting = bacgroundCorrect(blimatesting, normalizationMod=c, channelBackgroundFilter="bgf")
  blimatesting = nonPositiveCorrect(blimatesting, normalizationMod=c, channelCorrect="GrnF", channelBackgroundFilter="bgf")
}
bacgroundCorrectSingleArray

Data background correction.

Description

Background correction procedure selecting beads with background Intensity $I_b | \text{mean} - I_b | > k*\text{SD}(I_b)$ for exclusion, internal.

Usage

bacgroundCorrectSingleArray(b, normalizationMod = NULL, channelBackground = "GrnB", k = 3, channelBackgroundFilter = "bgf", channelAndVector = NULL)

Arguments

b List of beadLevelData objects (or single object).

normalizationMod NULL for normalization of all input $b$. Otherwise specifies logical vector of the length equals to the number of arrays in $b$ or list of such vectors if $b$ is a list of beadLevelData classes.

channelBackground Name of channel to normalize.

k Parameter of method stringency (default is 3).

channelBackgroundFilter Filtered beads will have weight 0 and non filtered weight 1.

channelAndVector Represents vector to bitwise multiple to the channelBackgroundFilter vector.

Author(s)

Vojtech Kulvait

backgroundChannelSubtract

Background channel subtraction

Description

Function to subtract one channel from another producing new channel. Standard graphic subtraction.
backgroundChannelSubtractSingleArray

Background channel subtraction

Description

INTERNAL FUNCTION Correction for positive values only

Usage

backgroundChannelSubtract(b, normalizationMod = NULL, channelSubtractFrom = "GrnF", channelSubtractWhat = "GrnB", channelResult = "Grn")

Arguments

b List of beadLevelData objects (or single object).
normalizationMod NULL for performing on all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b or list of such vectors if b is a list of beadLevelData classes.
channelSubtractFrom Name of channel to subtract from.
channelSubtractWhat Name of channel to subtract.
channelResult Result channel, if this channel exists it will be overwritten.

Author(s)

Vojtech Kulvait

Examples

if(require("blimaTestingData") &amp; interactive())
{
  #To perform background correction on blimatesting object for two groups. Background correction is followed by correction for non positive data. Array spots out of selected groups will not be processed.
  data(blimatesting)
  #Prepare logical vectors corresponding to conditions A and E.
  groups1 = "A"
  groups2 = "E"
  sampleNames = list()
  c = list()
  for(i in 1:length(blimatesting))
  {
    p = pData(blimatesting[[i]]@experimentData$phenoData)
    c[[i]] = p$Group %in% c(groups1, groups2);
    sampleNames[[i]] = p$Name
  }
  #Background correction and quantile normalization followed by testing including log2TransformPositive transformation.
  blimatesting = backgroundCorrect(blimatesting, normalizationMod=c, channelBackgroundFilter="bgf")
  blimatesting = nonPositiveCorrect(blimatesting, normalizationMod=c, channelCorrect="GrnF", channelBackgroundFilter="bgf")
}

else
{
  print("To run this example, please install blimaTestingData package from bioconductor by running biocLite(

backgroundChannelSubtractSingleArray

Background channel subtraction

Description

INTERNAL FUNCTION Correction for positive values only
Usage

```r
backgroundChannelSubtractSingleArray(b, normalizationMod = NULL,
  channelSubtractFrom = "GrnF", channelSubtractWhat = "GrnB",
  channelResult = "Grn")
```

Arguments

- `b`: List of beadLevelData objects (or single object).
- `normalizationMod`: NULL for normalization of all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b or list of such vectors if b is a list of beadLevelData classes.
- `channelSubtractFrom`: Name of channel to subtract from.
- `channelSubtractWhat`: Name of channel to subtract.
- `channelResult`: Result channel, if this channel exists it will be overwritten.

Author(s)

Vojtech Kulvait

---

**channelExistsIntegrityWithLogicalVectorList**

*Internal function*

Description

Test existence of channel slot based on vector list

Usage

```r
channelExistsIntegrityWithLogicalVectorList(b, spotsToCheck = NULL,
  slotToCheck, action = c("returnText", "warn", "error"))
```

Arguments

- `b`: List of beadLevelData objects.
- `spotsToCheck`: NULL for check all spots from b. Otherwise specifies logical vector of the length equals to the number of arrays in b with TRUE for checking.
- `slotToCheck`: Slot name to check
- `action`: What type of action is required in case of invalid object structure. Either return text different from TRUE, warn or error.

Author(s)

Vojtech Kulvait
checkIntegrity

**Description**
Check integrity of the list of beadLevelData objects or single beadLevelData object returns was list.

**Usage**
checkIntegrity(b, action = c("warn", "error"))

**Arguments**
- **b**: List of beadLevelData objects or single.
- **action**: What type of action is required in case of invalid object structure. Either return text different from TRUE, warn or error.

**Value**
Returns value if the object was list or not before calling this function.

**Author(s)**
Vojtech Kulvait

---

checkIntegrityLogical

**Description**
Check integrity of the list of logical objects, internal.

**Usage**
checkIntegrityLogical(xx, b, action = c("returnText", "warn", "error"))

**Arguments**
- **xx**: List of logical objects compatible with a list b.
- **b**: List of beadLevelData objects.
- **action**: What type of action is required in case of invalid object structure. Either return text different from TRUE, warn or error.

**Author(s)**
Vojtech Kulvait
checkIntegrityOfListOfBeadLevelDataObjects

Internal function

Description
Check integrity of the list of beadLevelData objects, internal.

Usage
checkIntegrityOfListOfBeadLevelDataObjects(listb, action = c("returnText", "warn", "error"))

Arguments
- **listb**: List of beadLevelData objects.
- **action**: What type of action is required in case of invalid object structure. Either return text different from TRUE, warn or error.

Author(s)
Vojtech Kulvait

checkIntegrityOfSingleBeadLevelDataObject

Internal function

Description
Check integrity of single beadLevelData object, internal.

Usage
checkIntegrityOfSingleBeadLevelDataObject(b, action = c("returnText", "warn", "error"))

Arguments
- **b**: beadLevelData object.
- **action**: What type of action is required in case of invalid object structure. Either return text different from TRUE, warn or error.

Author(s)
Vojtech Kulvait
**chipArrayStatistics**  

**Statistics of beadLevelData**

**Description**

This function returns table with statistics of single beadLevelData object indexed by order of spots. It prints number of beads on each array spot mean foreground intensity and optionally mean background intensity, mean number of beads in probe set and unbiased estimate of standard deviations of these parameters. Optionally you can also obtain percentage of removed beads within excludedOnSDMultiple multiple of standard deviations from the background value.

**Usage**

```r
chipArrayStatistics(b, includeBeadStatistic = TRUE, channelForeground = "GrnF", channelBackground = "GrnB", includeBackground = TRUE, excludedOnSDMultiple = NA)
```

**Arguments**

- `b`: Single beadLevelData object.
- `includeBeadStatistic`: Include number of beads per probe in output.
- `channelForeground`: Name of channel of foreground.
- `channelBackground`: Name of channel of background.
- `includeBackground`: Whether to output background data.
- `excludedOnSDMultiple`: If positive number, print how much percents of the background lies more than excludedOnSDMultiple multipliers of standard deviation estimate away from background mean.

**Author(s)**

Vojtech Kulvait

**Examples**

```r
if(require("blimaTestingData") && interactive()) {
  #To print basic statistic data about blimatesting[[1]] object.
  data(blimatesting)
  array1stats = chipArrayStatistics(blimatesting[[1]], includeBeadStatistic=TRUE, excludedOnSDMultiple=3)
  array1pheno = pData(blimatesting[[1]]@experimentData$phenoData)
  array1stats = data.frame(array1pheno$Name, array1stats)
  colnames(array1stats)[1] <- "Array"
  print(array1stats);
} else {
  print("To run this example, please install blimaTestingData package from bioconductor by running biocLite()");
}
```
createSummarizedMatrix

*Summarized value matrix.*

**Description**

This function creates summarized matrix of values of certain type.

**Usage**

```r
createSummarizedMatrix(b, spotsToProcess = NULL, quality = "qua",
channelInclude = "bgf", annotationTag = NULL)
```

**Arguments**

- `b` List of beadLevelData objects (or single object).
- `spotsToProcess` NULL for processing all spots in `b`. Otherwise specifies logical vector of the length equals to the number of arrays in `b`.
- `quality` Quality to matrize.
- `channelInclude` This field allows user to set channel with weights which have to be from 0,1. All zero weighted items are excluded from summarization. You can turn this off by setting this NULL. This option may be used together with backgroundCorrect method or/and with beadarray QC (defaults to "bgf").
- `annotationTag` Tag from annotation file which to use in resulting matrix as colname.

**Author(s)**

Vojtech Kulvait

**Examples**

```r
if(require("blimaTestingData") && require("illuminaHumanv4.db") && interactive())
{
  #Create summarization of nonnormalized data from GrnF column.
  data(blimatesting)
  blimatesting = bacgroundCorrect(blimatesting, channelBackgroundFilter="bgf")
  blimatesting = nonPositiveCorrect(blimatesting, channelCorrect="GrnF", channelBackgroundFilter="bgf", channelAndVector="bgf")
  #Prepare logical vectors corresponding to conditions A(groups1Mod), E(groups2Mod) and both(processingMod)
  nonnormalized = createSummarizedMatrix(blimatesting, quality="GrnF", channelInclude="bgf",
annotationTag="Name")
  head(nonnormalized)
}
```

```r
}else
{
  print("To run this example, please install blimaTestingData package from bioconductor by running biocLite(

```
doAction

**Description**

Performs action of certain type

**Usage**

```r
doAction(message, action = c("returnText", "warn", "error"))
```

**Arguments**

- `message` Text message.
- `action` What type of action is required in case of invalid object structure. Either return text different from TRUE, warn or error.

**Author(s)**

Vojtech Kulvait

---

doProbeTTests

**Description**

This function does aggregated probe level t-tests on the data provided by the object beadLevelData from package beadarray.

**Usage**

```r
doProbeTTests(b, c1, c2, quality = "qua", channelInclude = "bgf", correction = "BY", transformation = NULL)
```

**Arguments**

- `b` List of beadLevelData objects (or single object).
- `c1` List of logical vectors of data to assign to the first group (or single vector).
- `c2` List of logical vectors of data to assign to the second group (or single vector).
- `quality` Quality to analyze, default is "qua".
- `channelInclude` This field allows user to set channel with weights which have to be 0,1. All zero weighted items are excluded from t-test. You can turn this off by setting this NULL. This option may be used together with backgroundCorrect method or/and with beadarray QC (defaults to "bgf").
- `correction` Multiple testing adjustment method as defined by p.adjust function, default is "BY".
- `transformation` Function of input data trasformation, default is NULL. Any function which for input value returns transformed value may be supplied. T-test then will be evaluated on transformed data, consider use log2TranformPositive.
doProbeTTests

Author(s)

Vojtech Kulvait

Examples

```r
if(require("blimaTestingData") && require("illuminaHumanv4.db") && interactive()) {
  #To perform background correction, variance stabilization and quantile normalization then test on probe level and bead level.
  data(blimatesting)
  #Prepare logical vectors corresponding to conditions A(groups1Mod), E(groups2Mod) and both(processingMod).
  groups1 = "A"
  groups2 = "E"
  sampleNames = list()
  groups1Mod = list()
  groups2Mod = list()

  probeTop10 = tocmp[sortPL[1:10],]
  print(beadTop10)
}
```
doTTests

T-test for bead (detector) level data.

Description
This function does t-tests on the data provided by the object beadLevelData from package beadarray.

Usage
doTTests(b, c1, c2, quality = "qua", channelInclude = "bgf", correction = "BY", transformation = NULL)

Arguments
b
List of beadLevelData objects (or single object).
c1
List of logical vectors of data to assign to the first group (or single vector).
c2
List of logical vectors of data to assign to the second group (or single vector).
quality
Quality to analyze, default is "qua".
channelInclude
This field allows user to set channel with weights which have to be 0,1. All zero weighted items are excluded from t-test. You can turn this off by setting this NULL. This option may be used together with backgroundCorrect method or/and with beadarray QC (defaults to "bgf").
correction
Multiple testing adjustment method as defined by p.adjust function, default is "BY".
transformation
Function of input data transformation, default is NULL. Any function which for input value returns transformed value may be supplied. T-test then will be evaluated on transformed data, consider use log2TransformPositive.

filterBg

Bg correct vector

Description

Background correction procedure selecting beads with background Intensity I_b |mean - I_b | > k*SD(I_bs) for exclusion, internal.
Usage

filterBg(x, k = 3)

Arguments

x Vector to correct
k Parameter of method stringency (default is 3).

Author(s)

Vojtech Kulvait

g getNextVector  Support probe and bead level testing.

Description

Internal function supporting probe and bead level testing.

Usage

g getNextVector(what, from, length)

Arguments

what Two column sorted matrix with probe values.
from Index to start on
length nrow(what)

Author(s)

Vojtech Kulvait

initMeanDistribution

Description

This is internal function not intended to direct use which initializes mean distribution.

Usage

initMeanDistribution(srt, prvku)

Arguments

srt vector of sorted values
prvku number of items in meanDistribution

Author(s)

Vojtech Kulvait
**insertColumn**

*Internal function to support chipArrayStatistics*

**Description**

Internal

**Usage**

```
insertColumn(matrix, column, name)
```

**Arguments**

- `matrix`: Object to insert column to
- `column`: Column to insert
- `name`: Name of column to assign.

**Author(s)**

Vojtech Kulvait

---

**log2TransformPositive**  
*Log2 transform of numbers >1.*

**Description**

Transformation function are popular in beadarray package. Here this is similar concept. This function allow user to perform log transformation before doing t-tests.

**Usage**

```
log2TransformPositive(x)
```

**Arguments**

- `x`: Number to transform.

**Value**

This function returns logarithm of base 2 for numbers >=1 and zero for numbers <1.

**Author(s)**

Vojtech Kulvait
meanDistribution

Produce sorted double vector with mean distribution.

Description

This function processes arrays in the object beadLevelData from package beadarray and returns sorted double vector. The vector has length prvku. And the distribution of this vector is a "mean" of all distributions of distributionChannel quantity in arrays. In case that probe numbers are different from prvku it does some averaging.
Usage

meanDistribution(b, normalizationMod = NULL, distributionChannel = "Grn", channelInclude = NULL, prvku)

Arguments

b Object beadLevelData from package beadarray or list of these objects

normalizationMod NULL for normalization of all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b or list of such vectors if b is a list of beadLevelData classes (defaults to NULL).

distributionChannel Channel to do mean distribution from (defaults to "Grn").

channelInclude This field allows user to set channel with weights which have to be in 0,1. All zero weighted items are excluded from quantile normalization and the value assigned to such probes is a close to value which would be assigned to them if not being excluded. You can turn this off by setting this NULL. This option may be used together with bacgroundCorrect method or/and with beadarray QC (defaults to NULL).

prvku Number of items in a resulting double vector. Prvku must not be more than minimal number of included items in any distributionChannel.

Author(s)

Vojtech Kulvait

nonParametricEstimator

INTERNAL FUNCTION Xie background correct.

Description

INTERNAL This function is not intended for direct use. Background correction according to non parametric estimator in Xie, Yang, Xinlei Wang, and Michael Story. "Statistical Methods of Background Correction for Illumina BeadArray Data." Bioinformatics 25, no. 6 (March 15, 2009): 751-57. doi:10.1093/bioinformatics/btp040. The method is applied on the bead level.

Usage

nonParametricEstimator(toCorrectAll, toCorrectNeg)

Arguments

toCorrectAll

toCorrectNeg

Author(s)

Vojtech Kulvait
nonPositiveCorrect  
Correct non positive

Description
Correction for positive values only

Usage
nonPositiveCorrect(b, normalizationMod = NULL, channelCorrect = "GrnF", channelBackgroundFilter = "bgf", channelAndVector = NULL)

Arguments
- **b**: List of beadLevelData objects (or single object).
- **normalizationMod**: NULL for normalization of all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b or list of such vectors if b is a list of beadLevelData classes.
- **channelCorrect**: Name of channel to correct.
- **channelBackgroundFilter**: Filtered beads will have weight 0 and non filtered weight 1.
- **channelAndVector**: Represents vector to bitwise multiple to the channelBackgroundFilter vector.

Author(s)
Vojtech Kulvait

Examples
if(require("blimaTestingData") & interactive())
{
  #To perform background correction on blimatesting object for two groups. Background correction is followed by quantile normalization followed by testing including log2TransformPositive transformation.
  blimatesting = backgroundCorrect(blimatesting, normalizationMod=c, channelBackgroundFilter="bgf")
  blimatesting = nonPositiveCorrect(blimatesting, normalizationMod=c, channelCorrect="GrnF", channelAndVector=c)
} else
{
  print("To run this example, please install blimaTestingData package from bioconductor by running biocLite()")
}
**nonPositiveCorrectSingleArray**

*Correct non positive*

**Description**

INTERNAL FUNCTION Correction for positive values only

**Usage**

```r
nonPositiveCorrectSingleArray(b, normalizationMod = NULL, channelCorrect = "GrnF", channelBackgroundFilter = "bgf", channelAndVector = NULL)
```

**Arguments**

- **b** List of beadLevelData objects (or single object).
- **normalizationMod** NULL for normalization of all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b or list of such vectors if b is a list of beadLevelData classes.
- **channelCorrect** Name of channel to correct.
- **channelBackgroundFilter** Filtered beads will have weight 0 and non filtered weight 1.
- **channelAndVector** Represents vector to bitwise multiple to the channelBackgroundFilter vector.

**Author(s)**

Vojtech Kulvait

---

**numberOfDistributionElements**

*Internal*

**Description**

Internal function

**Usage**

```r
numberOfDistributionElements(b, normalizationMod = NULL, channelInclude = NULL)
```

**Arguments**

- **b** Object beadLevelData from package beadarray or list of these objects
- **normalizationMod** NULL for normalization of all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b or list of such vectors if b is a list of beadLevelData classes.
- **channelInclude**
**Description**

INTERNAL This function is not intended for direct use. Background correction according to non parametric estimator in Xie, Yang, Xinlei Wang, and Michael Story. "Statistical Methods of Background Correction for Illumina BeadArray Data." Bioinformatics 25, no. 6 (March 15, 2009): 751-57. doi:10.1093/bioinformatics/btp040. ###The method is applied on the bead level.

**Usage**

performXieCorrection(value, alpha, mu, sigma)

**Arguments**

- value
- alpha
- mu
- sigma

**Author(s)**

Vojtech Kulvait

---

**Description**

Plot background image after correction

**Usage**

plotBackgroundImageAfterCorrection(b, index, channelForeground = "GrnF", channelBackground = "GrnB", SDMultiple = 3, includePearson = FALSE)
Arguments

b  Single beadLevelData object.
index Index of spot to generate.
channelForeground  Name of channel of foreground.
channelBackground  Name of channel of background.
SDMultiple  Correct on this level.
includePearson  Include Pearson correlation.

Author(s)

Vojtech Kulvait

Examples

```r
if(require("blimaTestingData") && interactive())
{
  #Write background images after correction. This function prints graph for condition D4. Call dev.off() to close.
  data(blimatesting)
  p = pData(blimatesting[[2]]@experimentData$phenoData)
  index = base::match("D4", p$Name)
  plotBackgroundImageAfterCorrection(blimatesting[[2]], index)
} else
{
  print("To run this example, please install blimaTestingData package from bioconductor by running biocLite(
  }
```

plotBackgroundImageBeforeCorrection

Plot background image before correction

Description

This function plots image of background distribution versus to foreground before background subtraction.

Usage

```r
plotBackgroundImageBeforeCorrection(b, index, channelForeground = "GrnF", channelBackground = "GrnB", includePearson = FALSE)
```

Arguments

b  Single beadLevelData object.
index Index of spot to generate.
channelForeground  Name of channel of foreground.
channelBackground  Name of channel of background.
includePearson  Include Pearson correlation.
quantileNormalize

**Bead level quantile normalization.**

**Description**

This function does quantile normalization of object beadLevelData from package beadarray.

**Usage**

```r
quantileNormalize(b, normalizationMod = NULL, channelNormalize = "Grn", channelOutput = "qua", channelInclude = NULL, dst)
```

**Arguments**

- `b` Object beadLevelData from package beadarray or list of these objects
- `normalizationMod` NULL for normalization of all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b or list of such vectors if b is a list of beadLevelData classes.
- `channelNormalize` Name of channel to normalize.
- `channelOutput` Name of output normalized channel.
- `channelInclude` This field allows user to set channel with weights which have to be in 0,1. All zero weighted items are excluded from quantile normalization and the value assigned to such probes is a close to value which would be assigned to them if not being excluded. You can turn this off by setting this NULL. This option may be used together with backgroundCorrect method or/and with beadarray QC (defaults to NULL).
- `dst` User can specify sorted vector which represents distribution that should be assigned to items.

**Author(s)**

Vojtech Kulvait
Examples

```r
if(require("blimaTestingData") && interactive())
{
    # To perform background correction, variance stabilization and quantile normalization.
    data(blimatesting)
    # Prepare logical vectors corresponding to conditions A(groups1Mod), E(groups2Mod) and both(c).
    groups1 = "A";
    groups2 = "E";
    sampleNames = list()
    processingMod = list()
    for(i in 1:length(blimatesting))
    {
        p = pData(blimatesting[[i]]@experimentData$phenoData)
        processingMod[[i]] = p$Group %in% c(groups1, groups2);
        sampleNames[[i]] = p$Name
    }
    # Background correction and quantile normalization followed by testing including log2TransformPositive transformation.
    blimatesting = backgroundCorrect(blimatesting, normalizationMod = processingMod, channelBackgroundFilter="bgf")
    blimatesting = nonPositiveCorrect(blimatesting, normalizationMod = processingMod, channelCorrect="GrnF", channelBackgroundFilter="bgf")
    blimatesting = varianceBeadStabilise(blimatesting, normalizationMod = processingMod, quality="GrnF", channelInclude="bgf", channelOutput="vst")
    blimatesting = quantileNormalize(blimatesting, normalizationMod = processingMod, channelNormalize="vst", channelInclude="bgf", channelOutput="qua")
} else {
    print("To run this example, please install blimaTestingData package from bioconductor by running biocLite()");
}
```

readToVector

**Support doTTests function.**

**Description**

Internal function supporting doTTests function.

**Usage**

`readToVector(what, from, length, quality)`

**Arguments**

- `what`: Item to read.
- `from`: From index.
- `length`: Length of vector.
- `quality`: Column.

**Author(s)**

Vojtech Kulvait
selectedChannelTransform

Channel transformation

Description

Function to transform channel data.

Usage

```r
selectedChannelTransform(b, normalizationMod = NULL, channelTransformFrom,
channelResult, transformation = NULL)
```

Arguments

- `b`: List of beadLevelData objects (or single object).
- `normalizationMod`: NULL for performing on all input `b`. Otherwise specifies logical vector of the length equals to the number of arrays in `b` or list of such vectors if `b` is a list of beadLevelData classes.
- `channelTransformFrom`: Name of channel to transform.
- `channelResult`: Result channel, if this channel exists it will be overwritten.
- `transformation`: Function of input data transformation, default is NULL. Any function which for input value returns transformed value may be supplied. T-test then will be evaluated on transformed data, consider use log2TranformPositive.

Author(s)

Vojtech Kulvait

Examples

```r
if(require("blimaTestingData") && interactive()){
  #To perform background correction on blimatesting object for two groups. Background correction is followed by quantile normalization and correction for non positive data.
  data(blimatesting)
  #Prepare logical vectors corresponding to conditions A and E.
  groups1 = "A";
  groups2 = "E";
  sampleNames = list()
  c = list()
  for(i in 1:length(blimatesting)) {
    p = pData(blimatesting[[i]]@experimentData$phenoData)
    c[[i]] = p$Group %in% c(groups1, groups2);
    sampleNames[[i]] = p$Name
  }
  #Background correction and quantile normalization followed by testing including log2TransformPositive transformation.
  blimatesting = backgroundCorrect(blimatesting, normalizationMod=c, channelBackgroundFilter="bgf")
  blimatesting = nonPositiveCorrect(blimatesting, normalizationMod=c, channelCorrect="GrnF", channelBackgroundFilter="bgf")
}
```
selectedChannelTransformSingleArray

Channel transformation

Description

Function to transform channel data.

Usage

```r
selectedChannelTransformSingleArray(b, normalizationMod = NULL,
  channelTransformFrom, channelResult, transformation)
```

Arguments

- `b` List of beadLevelData objects (or single object).
- `normalizationMod` NULL for performing on all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b or list of such vectors if b is a list of beadLevelData classes.
- `channelTransformFrom` Name of channel to transform.
- `channelResult` Result channel, if this channel exists it will be overwritten.
- `transformation` Function of input data trasformation, default is NULL. Any function which for input value returns transformed value may be supplied. T-test then will be evaluated on transformed data, consider use log2TranformPositive.

singleArrayNormalize

Bead level quantile normalization.

Description

This function does quantile normalization of object beadLevelData from package beadarray. Internal function not intended to direct use. Please use quantileNormalize.

Usage

```r
singleArrayNormalize(b, normalizationMod = NULL, channelNormalize = "Grn",
  channelOutput = "qua", channelInclude = NULL, dst)
```
singleChannelExistsIntegrityWithLogicalVector

Arguments

b Object beadLevelData from package beadarray

normalizationMod NULL for normalization of all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b.

channelNormalize Name of channel to normalize.

channelOutput Name of output normalized channel.

channelInclude This field allows user to set channel with weights which have to be in 0,1. All zero weighted items are excluded from quantile normalization and the value assigned to such probes is a close to value which would be assigned to them if not being excluded. You can turn this off by setting this NULL. This option may be used together with backgroundCorrect method or/and with beadarray QC (defaults to NULL).

dst This field must be sorted. It is a distribution of values to assign to ports. By default this distribution is computed using meanDistribution function.

Author(s)

Vojtech Kulvait

Description

Test existence of channel slot based on logical list

Usage

singleChannelExistsIntegrityWithLogicalVector(b, spotsToCheck = NULL, slotToCheck, action = c("returnText", "warn", "error"))

Arguments

b single beadLevelData object

spotsToCheck NULL for check all spots from b. Otherwise specifies logical vector of the length equals to the number of arrays in b with TRUE for checking.

slotToCheck Slot name to check

action What type of action is required in case of invalid object structure. Either return text different from TRUE, warn or error.

Author(s)

Vojtech Kulvait
**singleCheckIntegrityLogicalVector**  
*Internal function*

**Description**
Check integrity of the logical object, internal.

**Usage**
singleCheckIntegrityLogicalVector(xx, b, action = c("returnText", "warn", "error"))

**Arguments**
- **xx**: Logical object compatible with b.
- **b**: Single beadLevelData object.
- **action**: What type of action is required in case of invalid object structure. Either return text different from TRUE, warn or error.

**Author(s)**
Vojtech Kulvait

---

**singleNumberOfDistributionElements**  
*Internal*

**Description**
Internal function

**Usage**
singleNumberOfDistributionElements(b, normalizationMod = NULL, channelInclude = NULL)

**Arguments**
- **b**: Object beadLevelData from package beadarray
- **normalizationMod**: NULL for normalization of all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b or list of such vectors if b is a list of beadLevelData classes.
- **channelInclude**:

**Author(s)**
Vojtech Kulvait
updateMeanDistribution

Description

This is internal function not intended to direct use. Updates mean distribution.

Usage

updateMeanDistribution(meanDistribution, srt, arraysUsed)

Arguments

meanDistribution

srt vector of sorted values

arraysUsed number of arrays allready used to create distribution

Author(s)

Vojtech Kulvait

varianceBeadStabilise  Bead level VST.

Description

This function does variance stabilising step on bead level.

Usage

varianceBeadStabilise(b, normalizationMod = NULL, quality = "qua",
channelInclude = "bgf", channelOutput = "vst")

Arguments

b List of beadLevelData objects (or single object).

normalizationMod NULL for normalization of all input b. Otherwise specifies logical vector of the
length equal to the number of arrays in b or list of such vectors if b is a list of
beadLevelData classes.

quality Quality to analyze, default is "qua".

channelInclude This field allows user to set channel with weights which have to be in 0,1. All
zero weighted items are excluded from t-test. You can turn this off by setting
this NULL. This option may be used together with backgroundCorrect method
or/and with beadarray QC (defaults to "bgf").

channelOutput Output from VST.
Author(s)
Vojtech Kulvait

Examples

```r
if(require("blimaTestingData") && interactive()) {
  #To perform background correction, variance stabilization and quantile normalization.
  data(blimatesting)
  #Prepare logical vectors corresponding to conditions A(groups1Mod), E(groups2Mod) and both(c).
  groups1 = "A";
  groups2 = "E";
  sampleNames = list()
  processingMod = list()
  for(i in 1:length(blimatesting)) {
    p = pData(blimatesting[[i]]@experimentData$phenoData)
    processingMod[[i]] = p$Group %in% c(groups1, groups2);
    sampleNames[[i]] = p$Name
  }
  #Background correction and quantile normalization followed by testing including log2TransformPositive transformation.
  blimatesting = backgroundCorrect(blimatesting, normalizationMod = processingMod, channelBackgroundFilter="bgf")
  blimatesting = nonPositiveCorrect(blimatesting, normalizationMod = processingMod, channelCorrect="GrnF", channelBackgroundFilter="bgf")
  blimatesting = varianceBeadStabilise(blimatesting, normalizationMod = processingMod, quality="GrnF", channelInclude="bgf", channelOutput="vst")
  blimatesting = quantileNormalize(blimatesting, normalizationMod = processingMod, channelNormalize="vst", channelOutput="qua", channelInclude="bgf")
} else {
  print("To run this example, please install blimaTestingData package from bioconductor by running biocLite("")
}
```

varianceBeadStabiliseSingleArray

Bead level VST.

Description

This function is not intended to direct use it takes single beadLevelData object and do bead level variance stabilisation.

Usage

```r
varianceBeadStabiliseSingleArray(b, normalizationMod = NULL, quality = "qua", channelInclude = "bgf", channelOutput = "vst")
```

Arguments

- **b**: Object beadLevelData.
- **normalizationMod**: NULL for normalization of all input b. Otherwise specifies logical vector of the length equals to the number of arrays in b.
- **quality**: Quality to analyze, default is "qua".
channelInclude This field allows user to set channel with weights which have to be in 0,1. All zero weighted items are excluded from t-test. You can turn this off by setting this NULL. This option may be used together with backgroundCorrect method or/and with beadarray QC (defaults to "bgf").

channelOutput Output from VST.

vstFromLumi Function from LGPL lumi package 2.16.0

Description

This function is derived from copy and paste of lumi::vst function. Since lumi package has extensive imports I decided to hardcode this function to the blima instead of importing lumi package.

Usage

vstFromLumi(u, std, nSupport = min(length(u), 500), backgroundStd = NULL, lowCutoff = 1/3)

Arguments

u The mean of probe beads
std The standard deviation of the probe beads
nSupport Something for c3 guess.
backgroundStd Estimate the background variance c3. Input should be variance according to article, not SD.
lowCutoff Something for c3 guess.

Author(s)

authors are Pan Du, Simon Lin, the function was edited by Vojtech Kulvait

References

writeBackgroundImages  Write Background Images

Description

This function writes images with background distribution according to foreground before and after background subtraction.

Usage

writeBackgroundImages(b, spotsToGenerate = NULL, imageType = c("jpg", "png", "eps"), channelForeground = "GrnF", channelBackground = "GrnB", SDMultiple = 3, includePearson = FALSE, outputDir = getwd(), width = 505, height = 505)

Arguments

b Single beadLevelData object.
spotsToGenerate NULL for generate images for all spots from b. Otherwise specifies logical vector of the length equals to the number of arrays in b with TRUE for images to generate.
imageType Type of images produced, either jpg, png or eps
channelForeground Name of channel of foreground.
channelBackground Name of channel of background.
SDMultiple Correct on this level.
includePearson Include Pearson correlation.
outputDir Directory where to output images.
width Width of image (default 505 fits well for 86mm 150dpi illustration in Bioinformatics journal:)
height Height of image

Author(s)

Vojtech Kulvait

Examples

if(require("blimaTestingData") & interactive())
{
  #Write background images before and after correction for background into /tmp directory. This function creates
data(blimaTesting)
p = pData(blimaTesting[[2]]@experimentData$phenoData)
  spotsToGenerate = p$Group %in% "D";
  writeBackgroundImages(blimaTesting[[2]], imageType="jpg", spotsToGenerate=spotsToGenerate, includePearson=FALSE, outputDir="/tmp")
}
else
{
  print("To run this example, please install blimaTestingData package from bioconductor by running biocLite("");
}
xieBacgroundCorrect  Xie background correct.

Description
Background correction according to non parametric estimator in Xie, Yang, Xinlei Wang, and Michael Story. "Statistical Methods of Background Correction for Illumina BeadArray Data." Bioinformatics 25, no. 6 (March 15, 2009): 751-57. doi:10.1093/bioinformatics/btp040. The method is applied on the bead level.

Usage
xieBacgroundCorrect(b, normalizationMod = NULL, negativeArrayAddresses, channelCorrect, channelResult, channelInclude = NULL)

Arguments
- **b** List of beadLevelData objects (or single object).
- **normalizationMod** NULL for processing all spots in b. Otherwise specifies logical vector of the length equals to the number of arrays in b.
- **negativeArrayAddresses** Vector of addresses of negative control probes on array
- **channelCorrect** Slot to perform convolution correction.
- **channelResult** Result channel, if this channel exists it will be overwritten.
- **channelInclude** This field allows user to set channel with weights which have to be from 0,1. All zero weighted items are excluded from summarization. You can turn this off by setting this NULL. This option may be used together with backgroundCorrect method or/and with beadarray QC (defaults to NULL).
