Package ‘categoryCompare’

January 27, 2016

Version 1.14.0

Title Meta-analysis of high-throughput experiments using feature annotations

Author Robert M. Flight <rflight79@gmail.com>

Maintainer Robert M. Flight <rflight79@gmail.com>

URL https://github.com/rmflight/categoryCompare

BugReports https://github.com/rmflight/categoryCompare/issues

License GPL-2

Depends R (>= 2.10), Biobase, BiocGenerics (>= 0.13.8),

Suggests knitr, methods, GO.db, KEGG.db, estrogen, org.Hs.eg.db, hgu95av2.db, limma, affy, genefilter

Imports AnnotationDbi, hwriter, GSEABase, Category (>= 2.33.1), GOstats, annotate, colorspace, graph, RCytoscape (>= 1.5.11)

LazyLoad yes

Description Calculates significant annotations (categories) in each of two (or more) feature (i.e. gene) lists, determines the overlap between the annotations, and returns graphical and tabular data about the significant annotations and which combinations of feature lists the annotations were found to be significant. Interactive exploration is facilitated through the use of RCytoscape (heavily suggested).

SystemRequirements Cytoscape (>= 2.8.0) (if used for visualization of results, heavily suggested), CytoscapeRPC plugin (>= 1.8)

TODO Text and HTML output without graphs.

biocViews Annotation, GO, MultipleComparison, Pathways, GeneExpression

VignetteBuilder knitr

NeedsCompilation no

breakEdges

Break Cytoscape (or graphNEL) Network Edges

Description

Removes those edges in a graph network with the edge attribute that is "under" or "over" the cutoff value supplied.

Usage

breakEdges(cwObject, cutoff, edgeAtt='weight', valDir='under', layout='force-directed')

Arguments

cwObject The object returned by ccOutCyt
cutoff What is the cutoff to select edges
breakEdges

edgeAtt Which edge attribute should be used for deciding which edges to select
valDir Select the edge attribute with values "under" (default) or "over" the input value
layout What type of layout should be used after the edges are broken

Details

When viewing annotations returned by ccCompare, unless a hierarchical view is used, the annotations are linked by edges weighted by how many genes are shared between each annotation. The default cutoff is 0.1, any edges above that are kept. This can result in a big hairy mess when viewing the annotation network in Cytoscape. To help clean up the display and encourage finding functionally related sets of annotations, it is very useful to remove edges with low values of overlap, and re-layout the network. breakEdges does just that.

The other option is to break the highly overlapping edges prior to sending the network to Cytoscape, thereby speeding up the process, as the fewer edges one has to "push" to Cytoscape the faster it will go.

Value

The first returns nothing, rather it modifies the network in Cytoscape itself.

The second returns a new ccCompareResult object for use by ccOutCyt

Examples

```r
## Not run:
require(RCytoscape)
g <- makeSimpleGraph()
cw <- CytoscapeWindow('breakEdges',g)
displayGraph(cw)
layout(cw)
redraw(cw)
breakEdges(cw,'score',0,layout=NULL)

## End(Not run)
```
### Description

Methods for function `breakEdges` in package `categoryCompare`

### Methods

**signature**(`cwobject = "ccCompareResult", cutoff = "numeric"`) Allows one to remove edges in the `ccCompareResult` mainGraph slot prior to passing it into Cytoscape for visualization. Given that the number of edges can be rather large (especially for Gene Ontology) this can easily speed up the transfer, without actually losing any information.

**signature**(`cwobject = "CytoscapeWindowClass", cutoff = "numeric"`) Once an annotation graph is in Cytoscape, remove edges above or below the cutoff. Note that this does not affect the original graph in the `ccCompareResult` object.

### Examples

```r
data(ccData)

# breaking the edges in a ccCompareResult
ccResults$BP <- breakEdges(ccResults$BP, 0.8)
## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") { (length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0) }
if hasCy {

cwObj <- ccOutCyt(ccResults$BP, ccOpts)
# now breaking them in the CytoscapeWindow object
breakEdges(cwObj, 0.85)
Sys.sleep(10)
RCytoscape::deleteWindow(cwObj)
}

## End(Not run)
```
Comparison of enriched annotations

Description
Takes the results from ccEnrich and compares the enriched annotations based on the settings previously set in ccOptions. Returns a ccCompareResult or ccCompareCollection object, see Details.

Usage
ccCompare(ccEnrichResult, ccOptions)

Arguments
ccEnrichResult  The enriched annotations collection returned from ccEnrich. This can be the ccEnrichCollection, GOccEnrichResult, or KEGGccEnrichResult
ccOptions  A ccOptions object that will determine which lists to actually compare against each other. See details below.

Details
Based on the enrichments found for each gene list, we now want to compare the annotations between lists. ccCompare accesses the annotations for each enrichment performed for each list, and makes the comparisons defined in ccOptions.

Value
ccCompare generates both a graph of the comparisons (to show how the categories are linked to each list and each other) and tabular output. The tabular output is a data frame, with ID for each term that was considered as a candidate annotation for each list, as well as a long description (Desc) of what the term is, and then membership and statistics from each gene list.

For each type of comparison (GO, KEGG, etc) a ccCompareResult is generated, with the following slots:

mainGraph  Annotations arranged as a graph
mainTable  The tabular results from all enrichment calculations combined into one
allAnnotation  A list of lists, where each entry is the annotation identifier, then a list for each comparison, with the genes that are annotated to that term that also belong to each list

The default is to generate an overlap graph for GO and KEGG, where the overlap is a measure of the similarity of the features (genes) annotated to each annotation term (based on a formula from EnrichmentMap). Optionally for GO, one can generate a hierarchical layout where the parent GO terms of the significant terms will also be included in the graph, with term origin saved in the node annotation (see example below to do this).
Only those terms with more than 10 and less than 500 annotated genes (according to the GO annotation file) are included.

When using weighted overlap graphs and **RCytoscape** for viewing, it is recommended to use `breakEdges` and `minNodes` to remove edges with low weights and nodes with only a few genes from the dataset annotated to them.

`ccCompareResult ccCompareCollection ccOutCyt breakEdges outType ccEnrich`

**Examples**

```r
## Not run:
require(GO.db)
require(KEGG.db)
require(org.Hs.eg.db)

## End(Not run)
data(ccData)

# note that enrichLists is generated from ccEnrich
# ccResults <- ccCompare(enrichLists,ccOpts)
ccResults

# use the GO hierarchy tree
graphType(enrichLists$BP) <- "hierarchical"
# ccResultsBPHier <- ccCompare(enrichLists$BP,ccOpts)
ccResultsBPHier
```

**Description**

Holds multiple `ccCompareResult` objects.

**Objects from the Class**

Objects can be created by calls of the form `new("ccCompareCollection", ...)`. These are not normally created by the user, but rather by `ccCompare` while performing the categorical comparisons for each type of category.
Slots

.Data: Object of class "list"

names: Object of class "character"

Extends

Methods

No methods defined with class "ccCompareCollection" in the signature.

Examples

showClass("ccCompareCollection")
ccCompareResult-class  

Class "ccCompareResult"

Description

Holds the results from a single category comparison

Objects from the Class

Objects can be created by calls of the form new("ccCompareResult", ...).

Slots

mainGraph: Object of class "graph". Holds the graph describing the relationships between the annotations

subGraph: Object of class "list". Not currently used

mainTable: Object of class "data.frame". Table of results, with all the various statistics for each annotation in the category

callAnnotation: Object of class "list". For each annotation, which genes from which comparison are annotated to that particular annotation

categoryName: Object of class "character". Which category (e.g. GO, KEGG, etc) was used

ontology: Object of class "character". If GO, which ontology was used

Methods

allAnnotation  signature(object = "ccCompareResult"): ...

mainGraph  signature(object = "ccCompareResult"): ...

mainTable<-  signature(object = "ccCompareResult"): ...

ccCompare ccCompareCollection

Examples

showClass("ccCompareResult")
Description

Processed data from the estrogen example data set

Usage

data(ccData)

Format

table10: Log-ratio output from \texttt{limma} for the comparison of presence-absence of estrogen at 10 hours

table48: Log-ratio output from \texttt{limma} for the comparison of presence-absence of estrogen at 48 hours

gUniverse: All of the genes measured on the chip

gseaRes: Toy results of GSEA analysis of 3 different tissues

enrichLists: Apply \texttt{ccEnrich} to a ccGeneList from table10 and table48

ccResults: Apply \texttt{ccCompare} to enrichLists

ccResultsBPHier: Modify enrichLists$BP to use a "hierarchical" layout

geneLists: a ccGeneList generated from genes in table10 and table48

ccOpts: a ccOptions object describing what we are going to do as far as feature list comparisons

Author(s)

Robert M Flight

Source

Taken from the \texttt{estrogen} package in Bioconductor, and then processed using the normal \texttt{affy} and \texttt{limma} tools.

\texttt{ccGeneList ccEnrichCollection ccCompareCollection ccEnrich ccCompare}

Examples

data(ccData)
ccEnrich-method

Description

Takes a `ccGeneList` object containing all the information needed to perform enrichment calculations for Gene Ontology.

Usage

`ccEnrich(ccGeneList)`

Arguments

`ccGeneList` A `ccGeneList` object, which is really just a list of lists, with some extra slots to tell us how to examine results. Each entry in the list should be named to allow identification later on. Each sub list should contain a vector `genes` denoting the genes of interest, a vector `universe` denoting the gene background (i.e. all genes on the chip), and an entry `annotation` denoting an organism database package (such as `org.Hs.eg.db`). See `ccGeneList` for more details regarding this object.

Details

This function is essentially a wrapper for `hyperGTestCC` that performs all of the calculations for the many gene lists in one go, returning a list of `HyperGResultCC` objects, one for each of the `cctypes` and each gene list. These various `HyperGResultCC` objects can then be accessed and results compared among the lists for each of the ontologies.

Value

A list of `HyperGResultCC` objects, one for each `cctype` and gene list, returned as `ccEnrichResult` objects for each `cctype`. This can be passed with a `ccOptions` object to `ccCompare` to generate actual annotation comparisons.

Examples

```r
## Not run:
require(GO.db)
require(KEGG.db)
require(org.Hs.eg.db)

## End(Not run)
data(ccData)

g10 <- (unique(table10$Entrez[1:100]))
g48 <- (unique(table48$Entrez[1:100]))

list10 <- list(genes=g10, universe=gUniverse, annotation="org.Hs.eg.db")
list48 <- list(genes=g48, universe=gUniverse, annotation="org.Hs.eg.db")

genelists <- list(T10=list10, T48=list48)
genelists <- new("ccGeneList", genelists, ccType=c("BP","KEGG"))
genelists <- new("ccGeneList", genelists, ccType=c("CC","KEGG"))

# set number of fdr runs to 0 to speed up runtime, not generally recommended.
genelists <- new("ccGeneList", genelists, ccType = c('BP','KEGG'), pvalueCutoff=0.01, fdr=0)
# enrichLists <- ccEnrich(genelists)
```

---

**ccEnrichCollection-class**

*Class "ccEnrichCollection"*

---

**Description**

Holds multiple classes of `ccEnrichResult` in one object to allow `ccCompare` to work on only the one object and generate all of the results of a comparison.

**Objects from the Class**

Objects can be created by calls of the form `new("ccEnrichCollection", ...)`. 

**Slots**

.data: Object of class "list"

.names: Object of class "character" The names (generally GO ontologies or KEGG, but can be changed) of each set of results

**Extends**

Methods

pvalueCutoff<- signature(r = "ccEnrichCollection"): Changes the pvalueCutoff to be used to decide significant annotations for all of the contained ccEnrichResult objects

pvalueType<- signature(object = "ccEnrichCollection"): Changes whether to use p-values or fdr values to determine those annotations that are significant in all of the contained ccEnrichResult objects

minCount<- signature(object = "ccEnrichCollection"): how many features have to be annotated to a term to be reported as significant

graphType signature(object = "ccEnrichCollection"): Gets the type of graph that should be output for this collection

Author(s)

Robert M Flight

Examples

data(ccData)
enrichLists

ccEnrichResult-class  Class "ccEnrichResult"

Description

Acts as a container object for multiple HyperGResultCC objects.

Objects from the Class

Objects can be created by calls of the form new("ccEnrichResult", ...).

Extends

Methods

- **fdr** signature(object = "ccEnrichResult"): get the number of runs using random feature lists were performed
- **pvalueCutoff** signature(r = "ccEnrichResult"): what is the pvalueCutoff to determine significant annotations
- **pvalueCutoff<-** signature(r = "ccEnrichResult"): change the pvalueCutoff for an annotation to be considered significant
- **pvalueType<-** signature(object = "ccEnrichResult"): change whether p-values used are from “FDR” or raw p-values
- **minCount** signature(object = "ccEnrichResult"): how many features need to belong to an annotation to be reported
- **minCount<-** signature(object = "ccEnrichResult"): adjust the minCount
- **graphType** signature(object = "ccEnrichResult"): what type of graph should be generated (generally set by the class of object)
- **graphType<-** signature(object = "ccEnrichResult"): change the type of graph to generate by ccCompare

Author(s)

Robert M Flight

Examples

```r
data(ccData)
enrichRes <- enrichLists[[1]]
fdr(enrichRes)
pvalueType(enrichRes)
enrichRes
pvalueType(enrichRes) <- 'pval'
enrichRes

pvalueCutoff(enrichRes)
pvalueCutoff(enrichRes) <- 0.01
enrichRes
```

---

**ccGeneList-class**  

Class "ccGeneList"

Description

This stores the actual gene lists and related information that will be used in categoryCompare.

Objects from the Class

Objects can be created by calls of the form `new("ccGeneList", list)`. `ccGeneList` is actually just an extension of R list objects. The input list should be a list of lists. See Details for more information.
Slots

fdr: Object of class "numeric" The number of fdr runs to perform to account for different list sizes and term dependence

pvalueCutoff: Object of class "numeric" Value used to determine whether or not a particular term is significant or not

ccType: Object of class "character" What types of annotations to use. Currently supported ones include "BP", "MF", "CC" (from Gene Ontology) and "KEGG"

testDirection: Object of class "character" Are you interested in "over" or "under" represented annotations

Methods

fdr signature(object = "ccGeneList"): how many random runs to perform

fdr<- signature(object = "ccGeneList"): change the number of random runs

pvalueCutoff signature(object = "ccGeneList"): what is the pvalue to consider significant

pvalueCutoff<- signature(object = "ccGeneList"): change the cutoff for significance

ccType signature(object = "ccGeneList"): what type of annotations are going to be examined

ccType<- signature(object = "ccGeneList"): change the type of annotations to examine

testDirection signature(object = "ccGeneList"): query for "over" or "under" represented annotations

testDirection<- signature(object = "ccGeneList"): change the type of representation ("over" or "under")

listNames signature(object = "ccGeneList"): what are the names of the lists contained

Details

The input list should be a list of lists, with at least three sub-lists.

testList <- list(list1=list(genes='...',universe='...'),annotation='...'), list2=list(...))

genes : These are the gene identifiers of the genes that are of interest (differentially expressed genes)

universe : All of the genes that were measured in this particular experiments (i.e. all the genes on the chip)

annotation : What organism or chip do these ID’s come from (e.g. "org.Hs.eg.db" for Human Entrez gene ID’s, "hgu133a.db" for probe ID’s from the Affymetrix U133A chip)

data : A data-frame that contains extra information about the genes of interest. At the very least, the data-frame must have a column ID that matches the ID’s contained in genes

What actually happens when running ccEnrich is that the appropriate HyperGParamsCC objects are generated for each geneList and each type of annotation (e.g. BP, CC, KEGG), and then the calculations performed on each one.
ccOptions-class

Note

The ccGeneList object is what will undergo all of the enrichment calculations. When the results are combined with the ccOptions object, we can get our results of actual comparisons between experiments.

ccOptions-class

Class "ccOptions"

Description

These objects store the various options required by categoryCompare for actually making comparisons and generating output.

Objects from the Class

Objects can be created by calls of the form new("ccOptions", listNames=c('list1','list2',etc)). This is the minimum call required, and will generate a ccOptions object where comparisons are assumed between all the lists supplied. See the examples section for more examples of how to initialize new objects.

Slots

listNames: Object of class "character" The actual names of the various datasets defined in the ccData object
compareNames: Object of class "character" Which lists to compare, each entry should be a comma separated list
compareIndex: Object of class "list" List indices for each of the comparison, not usually set by the user. Generated automatically.

compareColors: Object of class "character" For graphical and tabular output each comparison can be colored. Should be one color for each comparison. Can be either an n by 3 matrix of rgb triples, or a character vector of hexadecimal color codes, or character vector of color names ('red','green','blue', etc)

cssClass: Object of class "character" Classnames used when generating HTML tables to color entries. Generated automatically upon initialization, or modifying compareNames

outType: Object of class "character" Sets the type of output generated by ccTables. Valid types are "html", "text", "cytoscape" or "none", default is "text" when the ccOptions object is initialized without an outType specified.

Methods

compareToColors signature(object = "ccOptions"): ...

compareToColors<- signature(object = "ccOptions"): ...

compareToNames signature(object = "ccOptions"): ...

compareToNames<- signature(object = "ccOptions"): ...

cssClass signature(object = "ccOptions"): ...

listNames signature(object = "ccOptions"): ...

listNames<- signature(object = "ccOptions"): ...

outType signature(object = "ccOptions"): ...

outType<- signature(object = "ccOptions"): ...

Author(s)

Robert M Flight

Examples

showClass("ccOptions")

## A very basic "ccOptions" for a comparison of two sets of data, "list1" and "list2"
c1 <- new("ccOptions", listNames=c('list1','list2'))
c1

## Now lets get a little more complicated
c1 <- new("ccOptions", listNames=c('list1','list2'), compareNames=c('list1,list2','list1,list3'), compareToColors=c('red','blue'))
c1

# set the type of output you want to eventually produce
c1 <- new("ccOptions", listNames=c('list1','list2'), outType='html')
c1

c1 <- new("ccOptions", listNames=c('list1','list2'), outType=c('html','text','none'))
c1
## Using RGB colors

```r
ccCols <- matrix(c(255, 0, 0, 0, 0, 255), nrow=2, ncol=3)
ccCols <- rgb(ccCols, maxColorValue=255)
c1 <- new("ccOptions", listNames=c('list1', 'list2', 'list3'), compareNames=c('list1', 'list2', 'list1', 'list3'), compareColors=ccCols)
```

## Using Hex colors

```r
c1 <- new("ccOptions", listNames=c('list1', 'list2', 'list3'), compareNames=c('list1', 'list2', 'list1', 'list3'), compareColors=ccCols)
```

## or even using a color palette from R. Note that you need at least enough colors to cover all of individual and possible permutations

```r
c1 <- new("ccOptions", listNames=c('list1', 'list2', 'list3'), compareNames=c('list1', 'list2', 'list1', 'list3'), compareColors=ccCols)
```

---

## Methods for Function `ccOutCyt` in Package `categoryCompare`

### Description

Passes a `ccCompareResult` object to Cytoscape for interactive visualization of `ccCompare` results.

### Details

Note that only some basic, required methods have been imported from `RCytoscape` for use with `categoryCompare`, and these are hidden in the functions within `categoryCompare` and are not visible to the user. If access to all the functionality of `RCytoscape` is desired (and trust me, there is a lot of useful stuff in there), then the user should use `library(RCytoscape)` directly.

### Methods

```r
signature(ccCompRes = "ccCompareResult", ccOpts = "ccOptions", ...) At a minimum, this method requires a `ccCompareResult` and a `ccOptions` to work.

... may include:

- `layout = "character"` to override the default layout set by `ccCompare`, as well as options

- `postText = "character"` to add a user set string to the Cytoscape window

In addition, any of the arguments to `CytoscapeWindow` may also be set, such as host or port.

### See Also

- `ccCompareResult`
- `ccOptions`
- `ccCompare`
- `CytoscapeWindowClass`
Examples

```r
## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") { (length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0)} else {0})

if hasCy {
  ccResults$BP <- breakEdges(ccResults$BP, 0.8)
  cwObj <- ccOutCyt(ccResults$BP, ccOpts)
  Sys.sleep(10)
  RCytoscape::deleteWindow(cwObj)
}
```

### ccSigList-class

#### Class "ccSigList"

**Description**

Holds a generic list of significant annotations. Allows one to use Bioconductor annotation packages, or when combined into a `GENccEnrichResult`, use custom annotation / gene mappings.

**Objects from the Class**

Objects can be created by calls of the form `new("ccSigList", ...)`.  

**Slots**

- `sigID`: Object of class "character"
- `categoryName`: Object of class "character"
- `ontology`: Object of class "character"
- `annotation`: Object of class "character"

**Methods**

- `annotation` signature(object = "ccSigList"): ...
- `category` signature(object = "ccSigList"): ...
- `ontology` signature(object = "ccSigList"): ...
- `sigID` signature(object = "ccSigList"): ...

**Author(s)**

Robert M Flight

**See Also**

`GENccEnrichResult`, `ccCompareGeneric`
Examples

```r
showClass("ccSigList")
```

---

**Description**

Methods for function `cwReload` in package `categoryCompare`

**Methods**

```r
signature(oldCW = "CytoscapeWindowClass", windowName = "character", ccOpts = "ccOptions")
```

---

**Description**

Takes the `saveObj` generated by `cytOutNodes` and writes the data to a file.

**Value**

A text file with the annotations previously saved using `cytOutNodes`.

**Methods**

```r
signature(saveObj = "list", compareResult = "ccCompareResult", mergedData = "mergedData")
```

- `saveObj` is the list object generated by `cytOutNodes`, `compareResult` is the object from `ccCompare`, and `mergedData` is created using `mergeLists`, but is optional.
- `...`: optional arguments also include: `orgType`, default is "header" where each group is separate; "annotate" pushes all the data into one table with a new column that designates which groups the annotation was found in; `fileName`, the name of a text file to output the results to; `displayFile`, whether or not to display the file (default is "FALSE"))
Examples

```r
## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows")  
  (length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0)

if hasCy {
  data(ccData)
  ccResults$BP <- breakEdges(ccResults$BP, 0.8)
  cwObj <- ccOutCyt(ccResults$BP, ccOptS)
  # user selects some nodes in Cytoscape
  RCytoscape::selectNodes(cwObj, c("GO:0007017", "GO:0000226", "GO:0007051", "GO:0007052"))
  savedNodes <- cytOutNodes("random1", cwObj) # save them
  # and selects some other nodes
  RCytoscape::selectNodes(cwObj, c("GO:0071103", "GO:0034728", "GO:0006323", "GO:0030261", "GO:0006334"), preserveCurrentSelection=FALSE)
  savedNodes <- cytOutNodes("random2", cwObj, savedNodes)

  # now spit results out to a file
  cytOutData(savedNodes, ccResults$BP)
}
## End(Not run)
```

Description

Allows export of currently selected nodes in the Cytoscape window for data export.

Methods

signature(descStr = "character", cwObj = "CytoscapeWindowClass", saveObj = "list")

descStr is a string describing the nodes that are currently selected, cwObj is the CytoscapeWindow that the nodes are in, and then saveObj is a previously generated cytOutNodes list, and is optional.

Examples

```r
## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows")  
  (length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0)

if hasCy {
  ccResults$BP <- breakEdges(ccResults$BP, 0.8)
  cwObj <- ccOutCyt(ccResults$BP, ccOptS)
  # user selects some nodes in Cytoscape
  RCytoscape::selectNodes(cwObj, c("GO:0007017", "GO:0000226", "GO:0007051", "GO:0007052"))
  savedNodes <- cytOutNodes("random1", cwObj) # save them
  # and selects some other nodes
  RCytoscape::selectNodes(cwObj, c("GO:0071103", "GO:0034728", "GO:0006323", "GO:0030261", "GO:0006334"), preserveCurrentSelection=FALSE)
  savedNodes <- cytOutNodes("random2", cwObj, savedNodes)
```
fdr

Number of FDR runs to perform

Description

Queries or sets the number of random runs to perform to generate an estimate of the false discovery rate. Defaults to 50

Usage

fdr(object)

Arguments

object Can be ccGeneList, HyperGParamsCC, HyperGResultCC, ccEnrichResult. See Details for more information.

Details

fdr(object) gets the number of fdr runs for ccGeneList, HyperGParamsCC, HyperGResultCC, ccEnrichResult

fdr(object)<- will set the number of fdr runs to be used by ccEnrich and HyperGTestCC when performing calculations on either a ccGeneList or HyperGParamsCC, respectively

Author(s)

Robert M Flight

HyperGResultCC ccEnrichResult ccGeneList HyperGParamsCC
GENccEnrichResult-class

Class "GENccEnrichResult"

Description

Holds generic ccEnrich type results

Objects from the Class

Objects can be created by calls of the form new("GENccEnrichResult", ...).

Slots

.data: Object of class "list" The actual list containing the ccEnrichResults
categoryName: Object of class "character"
onontology: Object of class "character"
geneAnnMapping: Object of class "namedList"
graphType: Object of class "character"
names: Object of class "character"

Extends

Methods

[ signature(x = "GENccEnrichResult", i = "ANY", j = "ANY"): Subsets the object to just those lists that are desired
categoryName signature(object = "GENccEnrichResult"): ...
ccCompareGeneric signature(gccResult = "GENccEnrichResult", ccOptions = "ccOptions"): ...

geneAnnMapping signature(object = "GENccEnrichResult"): ...
graphType signature(object = "GENccEnrichResult"): ...
graphType<- signature(object = "GENccEnrichResult"): ...
onontology signature(object = "GENccEnrichResult"): ...

Author(s)

Robert M Flight

getGeneSymbol

Examples

data(ccData)
locA <- grep("A", gseaRes$Tissues)
locL <- grep("L", gseaRes$Tissues)
locM <- grep("M", gseaRes$Tissues)

A <- new("ccSigList", sigID=gseaRes$KEGGID[locA], categoryName="KEGG", annotation="org.Mm.e3")
L <- new("ccSigList", sigID=gseaRes$KEGGID[locL], categoryName="KEGG", annotation="org.Mm.e3")
M <- new("ccSigList", sigID=gseaRes$KEGGID[locM], categoryName="KEGG", annotation="org.Mm.e3")
ccEnrichCol <- list(A=A, L=L, M=M)
ccEnrichCol <- new("GENccEnrichResult", ccEnrichCol, categoryName="KEGG")

getGeneSymbol  Entrez to name, symbol, GO and path conversion, as well as general ID to ID conversion.

Description
Get different attributes for the Entrez gene IDs

Usage

geneSymbol(id, annPackage)
geneName(id, annPackage)
geneGO2ALLEGES(id, annPackage)
genePATH2EG(id, annPackage)
geneAnnotation(id, annPackage, mapID, doUnlist=TRUE)

Arguments

id  The IDs one wants to get information for.
annPackage  Which annotation package to use.
mapID  Which mapping to use
doUnlist  should the results be unlisted or not?

Details
The type of ID will change depending on the function. For getGene... the ID should be Entrez IDs. For getGO2ALLEGES Gene Ontology IDs should be used, and for getPATH2EG KEGG pathways IDs should be used. For getAnnotation, any ID can be used.

Value
Returns the requested information.

Note
These functions are generally called internally for mapping between genes and various objects.
Author(s)
Robert M Flight

Description

Gets and sets the graphType for a couple of different ccEnrichResults objects

Methods

signature(object = "ccEnrichResult")
signature(object = "GENccEnrichResult")

See Also
ccEnrichResult GENccEnrichResult

HyperGParamsCC-class

Class "HyperGParamsCC"

Description

This class extends the HyperGParams class in Category by providing options for multiple testing and the storing of extra data in addition to the gene list of interest (not currently used, but might be in the future).

Objects from the Class

Objects can be created by calls of the form new("HyperGParamsCC", ...). In general the user will not create these directly, but they are created and used by to carry out the enrichment calculations.

Slots

fdr: Object of class "numeric" The number of FDR runs to perform
data: Object of class "data.frame" Extra data stored in the object
geneIds: Object of class "ANY" The genes of interest
universeGeneIds: Object of class "ANY" The gene universe or background used (all the genes on the chip)
annotation: Object of class "character" The annotation package used to get information about the geneIds
datPkg: Object of class "DatPkg" Generated automatically from the annotation slot
categorySubsetIds: Object of class "ANY" A specific set of category IDs that one wants to restrict the testing to

categoryName: Object of class "character" What type of category to use, currently either "GO" or "KEGG"

pvalueCutoff: Object of class "numeric" What should be the p-value to decide significance

testDirection: Object of class "character" "over" or "under" represented annotation terms

Extends

Class "GOHyperGParams", directly.

Methods

No methods defined with class "HyperGParamsCC" in the signature.

Author(s)

Robert M Flight

See Also

HyperGResultCC ccEnrich Category-package

Examples

showClass("HyperGParamsCC")
oddsRatios: Object of class "numeric"
expectedCounts: Object of class "numeric"
catToGeneId: Object of class "list"
organism: Object of class "character"
annotation: Object of class "character"
geneIds: Object of class "ANY"
testName: Object of class "character"
pvalueCutoff: Object of class "numeric"
testDirection: Object of class "character"

Extends

Class "HyperGResult", directly. Class "HyperGResultBase", by class "HyperGResult", distance 2.

Methods

fdr signature(object = "HyperGResultCC"): ...
fdrvalues signature(object = "HyperGResultCC"): ...
pCC signature(object = "HyperGResultCC"): ...
pvalueCutoff<- signature(r = "HyperGResultCC"): ...
pvalueType signature(object = "HyperGResultCC"): ...
pvalueType<- signature(object = "HyperGResultCC"): ...
minCount signature(object = "HyperGResultCC"): ...
minCount<- signature(object = "HyperGResultCC"): ...

Examples

showClass("HyperGResultCC")
hyperGTestCC

Hypergeometric testing with false discovery rate

Description

Performs the hypergeometric testing for HyperGParamsCC objects.

Usage

hyperGTestCC(p)

Arguments

p  A HyperGParamsCC object

Details

This is the heart of categoryCompare, the function that calculates the HyperGeometric statistics for the given categories of annotation for each gene list.

Value

Returns a HyperGResultCC object

Author(s)

Robert M Flight

See Also

HyperGParamsCC HyperGResultCC GOHyperGParamsCC KEGGHyperGParamsCC GOHyperGResultCC KEGGHyperGResultCC

Examples

```r
require(GO.db)
require(org.Hs.eg.db)
data(ccData)
g10 <- unique(table10$Entrez)
# new("GOHyperGParamsCC", geneIds=g10, universeGeneIds=gUniverse, annotation="org.Hs.eg.db", ontology="CC", conditional=FALSE, testDirection="over", fdr=0, pvalueCutoff = 0.01)
# summary(ccHypRes <- hyperGTestCC(testGO))
```
listNames

Description
Extracts the listNames from ccGeneList or ccOptions objects.

Usage
listNames(object)

Arguments
object This will be either a ccGeneList or ccOptions object

Author(s)
Robert M Flight

See Also
ccGeneList ccOptions

mergedData-class

Description
Stores merged data tables from the "data" entry in a ccGeneList. This is useful for output later.

Objects from the Class
Objects can be created by calls of the form new("mergedData", ...).

Slots
.Data: Object of class "list"
useIDName: Object of class "character"
names: Object of class "character"
row.names: Object of class "data.frameRowLabels"
.S3Class: Object of class "character"
mergeLists-methods

Extends

Class "data.frame", directly. Class "list", by class "data.frame", distance 2. Class "oldClass", by class "data.frame", distance 2. Class "data.frameOrNULL", by class "data.frame", distance 2. Class "vector", by class "data.frame", distance 3.

Methods

signature(saveObj = "list", compareResult = "ccCompareResult", mergedData = "mergedData")

Author(s)

Robert M. Flight

See Also

mergeLists cytOutData

Examples

showClass("mergedData")

data(ccData)
mergeDat <- mergeLists(geneLists, ccOpts)

mergeLists-methods Function mergeLists in Package categoryCompare

Description

Merges the gene lists or the data tables from a ccGeneList object, providing a single table with all the input data, that can then be queried later, using cytTableOut

Usage

mergeLists(ccGeneList, ccOptions, isGene=TRUE)

Arguments

  ccGeneList a ccGeneList object
  ccOptions a ccOptions object
  isGene are the identifiers genes, or something else (metabolites, etc)

Value

A mergedData object which is really just a glorified data frame. If the ccGeneList input had a data list, then these are all merged into a single table. Otherwise, it contains just the gene names and which list they were present in.
Methods

signature(ccGeneList = "ccGeneList", ccOptions = "ccOptions")

See Also

ccGeneList ccOptions mergedData

Examples

data(ccData)
g10 <- (unique(table10$Entrez[1:100]))
g48 <- (unique(table48$Entrez[1:100]))

list10 <- list(genes=g10, universe=gUniverse, annotation="org.Hs eget.db", data=table10[1:100,])
list48 <- list(genes=g48, universe=gUniverse, annotation="org.Hs eget.db", data=table48[1:100,])

genelists <- list(T10=list10, T48=list48)
genelists <- new("ccGeneList", geneLists, ccType=c("BP","KEGG"))
ccOpts <- new("ccOptions", listNames = names(genelists))
mergedDat <- mergeLists(genelists,ccOpts)

list10 <- list(genes=g10, universe=gUniverse, annotation="org.Hs eget.db")
list48 <- list(genes=g48, universe=gUniverse, annotation="org.Hs eget.db")
genelists <- list(T10=list10, T48=list48)
genelists <- new("ccGeneList", geneLists, ccType=c("BP","KEGG"))
ccOpts <- new("ccOptions", listNames = names(genelists))
mergedDat <- mergeLists(genelists,ccOpts)

<table>
<thead>
<tr>
<th>minCount</th>
<th>minCount</th>
</tr>
</thead>
</table>

Description

Extracts and sets the minimum number of genes that an annotation must have to be considered in subsequent steps.

Usage

minCount(object)

Arguments

object       This will be either a HyperGResultCC, ccEnrichResult, or ccEnrichCollection object. See Details for more information.
**minNodes**

Details

`minCount(object)` fetches the set `minCount` for HyperGResultCC and ccEnrichResult objects. `minCount(object) <-` will set the `minCount` for HyperGResultCC objects, and when applied to ccEnrichResult and ccEnrichCollection sets the `minCount` for all of the contained objects, so be careful if you want to use different `minCounts` for different results.

**Author(s)**

Robert M Flight

**See Also**

HyperGResultCC ccEnrichResult ccEnrichCollection

**Examples**

```r
data(ccData)
enrichLists
minCount(enrichLists) <- 5
enrichLists
```

---

**minNodes**

*Delete nodes with less than a certain number of genes annotated*

**Description**

Deletes from the graph those annotations with less than a certain number of genes.

**Usage**

`minNodes(cwObj, cutoff)`

**Arguments**

- `cwObj` a CytoscapeWindowClass object returned from `ccOutCyt`
- `cutoff` the minimum number of genes that an annotation must have

**Author(s)**

Robert M Flight

**See Also**

CytoscapeWindowClass `ccOutCyt`
Examples

```r
## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") { (length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0)
if hasCy {
  data(ccData)
  ccResults$BP <- breakEdges(ccResults$BP, 0.8)
  cwObj <- ccOutCyt(ccResults$BP, ccOpt)
  minNodes(cwObj, 5)
}
## End(Not run)
```

---

**pvalueType**

*Type of p-values to return from object*

### Description

Queries or sets the type of p-values to return from objects, either base calculated (pvals) or from fdr calculations (fdr)

### Usage

```r
pvalueType(object)
```

### Arguments

- **object**: Can be HyperGResultCC, ccEnrichResult, ccEnrichCollection. See Details for more information

### Details

- `pvalueType(object)` gets the type of p-values to be returned from HyperGResultCC and ccEnrichResult objects
- `pvalueType(object)<-` will set the type of p-values to be returned from HyperGResultCC, ccEnrichResult, ccEnrichCollection. Note that for a ccEnrichCollection, the type is changed for all contained ccEnrichResults

### Author(s)

Robert M Flight

### See Also

HyperGResultCC ccEnrichResult ccEnrichCollection
Examples

```r
# pvalueType-Methods
data(ccData)

## Not run: pvalueType(enrichLists) # this returns an error
pvalueType(enrichLists[[1]])
pvalueType(enrichLists[[1]][[1]])

# change the type for one of the results
pvalueType(enrichLists[[1]]) <- 'pval' # note, I do not recommend changing it for a single result in a category
enrichLists

# change for all of the results
pvalueType(enrichLists) <- 'pval'
enrichLists
```

Description

If the color of particular nodes have been modified from the original color scheme in `ccOptions`, this will reset them.

Methods

```r
signature(cwObj = "CytoscapeWindowClass", ccOpts = "ccOptions")
```

What CytoscapeWindow to apply this to, and what `ccOptions` to use for the color scheme.

**Optional Arguments:** Note that optional arguments include `node.attribute.name` (default is ‘fillcolor’) and `mode` (default is ‘lookup’)

Note

This is most commonly used with the `cwReload` function, as the color scheme of the network does not get saved in the CYS file.
