Package ‘categoryCompare’

April 25, 2017

Version 1.20.0
Title Meta-analysis of high-throughput experiments using feature annotations
Author Robert M. Flight <rflight79@gmail.com>
Maintainer Robert M. Flight <rflight79@gmail.com>
URL https://github.com/rmflight/categoryCompare
BugReports https://github.com/rmflight/categoryCompare/issues
License GPL-2
Depends R (>= 2.10), Biobase, BiocGenerics (>= 0.13.8),
Suggests knitr, methods, GO.db, KEGG.db, estrogen, org.Hs.eg.db,
hgu95av2.db, limma, affy, genefilter
Imports AnnotationDbi, hwriter, GSEABase, Category (>= 2.33.1),
GOstats, annotate, colorspace, graph, RCytoscape (>= 1.5.11)
LazyLoad yes
Description Calculates significant annotations (categories) in each of two (or more) feature (i.e. gene) lists, determines the overlap between the annotations, and returns graphical and tabular data about the significant annotations and which combinations of feature lists the annotations were found to be significant. Interactive exploration is facilitated through the use of RCytoscape (heavily suggested).
SystemRequirements Cytoscape (>= 2.8.0) (if used for visualization of results, heavily suggested), CytoscapeRPC plugin (>= 1.8)
TODO Text and HTML output without graphs.
biocViews Annotation, GO, MultipleComparison, Pathways, GeneExpression
VignetteBuilder knitr
NeedsCompilation no

R topics documented:

  categoryCompare-package ........................................ 2

### breakEdges

**Description**

Removes those edges in a graph network with the edge attribute that is "under" or "over" the cutoff value supplied.

**Usage**

```r
textual_representation
```

**Arguments**

- `cwObject`: The object returned by `ccOutCyt`
- `cutoff`: What is the cutoff to select edges
- `edgeAtt`: Which edge attribute should be used for deciding which edges to select
- `valDir`: Select the edge attribute with values "under" (default) or "over" the input value
- `layout`: What type of layout should be used after the edges are broken

**Details**

When viewing annotations returned by `ccCompare`, unless a hierarchical view is used, the annotations are linked by edges weighted by how many genes are shared between each annotation. The default cutoff is 0.1, any edges above that are kept. This can result in a big hairy mess when viewing the annotation network in Cytoscape. To help clean up the display and encourage finding functionally related sets of annotations, it is very useful to remove edges with low values of overlap, and re-layout the network. `breakEdges` does just that.

The other option is to break the highly overlapping edges prior to sending the network to Cytoscape, thereby speeding up the process, as the fewer edges one has to "push" to Cytoscape the faster it will go.
Value

The first returns nothing, rather it modifies the network in Cytoscape itself. The second returns a new ccCompareResult object for use by ccOutCyt.

Examples

```r
## Not run:
require(RCytoscape)
g <- makeSimpleGraph()
cw <- CytoscapeWindow('breakEdges',g)
displayGraph(cw)
layout(cw)
redraw(cw)
breakEdges(cw,'score',0,layout=NULL)
## End(Not run)
```
Examples

```r
data(ccData)

# breaking the edges in a ccCompareResult
ccResults$BP <- breakEdges(ccResults$BP, 0.8)
## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") { (length(grep("Cytoscape", system("tasklist", intern=TRUE))))})

if hasCy {
  cwObj <- ccOutCyt(ccResults$BP,ccOpts)
  # now breaking them in the CytoscapeWindow object
  breakEdges(cwObj, 0.85)
  Sys.sleep(10)
  RCytoscape::deleteWindow(cwObj)
}
## End(Not run)
```

Description

Takes the results from `ccEnrich` and compares the enriched annotations based on the settings previously set in `ccOptions`. Returns a `ccCompareResult` or `ccCompareCollection` object, see Details.

Usage

```r
ccCompare(ccEnrichResult, ccOptions)
```

Arguments

- **ccEnrichResult**: The enriched annotations collection returned from `ccEnrich`. This can be the `ccEnrichCollection`, `GOccEnrichResult`, or `KEGGccEnrichResult`
- **ccOptions**: A `ccOptions` object that will determine which lists to actually compare against each other. See details below.

Details

Based on the enrichments found for each gene list, we now want to compare the annotations between lists. `ccCompare` accesses the annotations for each enrichment performed for each list, and makes the comparisons defined in `ccOptions`.

Value

`ccCompare` generates both a graph of the comparisons (to show how the categories are linked to each list and each other) and tabular output. The tabular output is a data frame, with ID for each term that was considered as a candidate annotation for each list, as well as a long description (`Desc`) of what the term is, and then membership and statistics from each gene list.

For each type of comparison (GO, KEGG, etc) a `ccCompareResult` is generated, with the following slots:
Annotations arranged as a graph
The tabular results from all enrichment calculations combined into one
A list of lists, where each entry is the annotation identifier, then a list for each
comparison, with the genes that are annotated to that term that also belong to
each list

The default is to generate an overlap graph for GO and KEGG, where the overlap is a measure of
the similarity of the features (genes) annotated to each annotation term (based on a formula from
EnrichmentMap). Optionally for GO, one can generate a hierarchical layout where the parent GO
terms of the significant terms will also be included in the graph, with term origin saved in the node
annotation (see example below to do this).

Only those terms with more than 10 and less than 500 annotated genes (according to the GO anno-
tation file) are included.

When using weighted overlap graphs and RCytoscape for viewing, it is recommended to use
breakEdges and minNodes to remove edges with low weights and nodes with only a few genes
from the dataset annotated to them.

ccResultsBPHier

---

Description
Holds multiple ccCompareResult objects.
Objects from the Class

Objects can be created by calls of the form `new("ccCompareCollection", ...)`. These are not normally created by the user, but rather by `ccCompare` while performing the categorical comparisons for each type of category.

Slots

- `.Data`: Object of class "list"
- `names`: Object of class "character"

Extends

Methods

No methods defined with class "ccCompareCollection" in the signature.

Author(s)

Robert M Flight

See Also

`ccCompareResult ccCompare`

Examples

```r
showClass("ccCompareCollection")
```
Description

Holds the results from a single category comparison

Objects from the Class

Objects can be created by calls of the form `new("ccCompareResult", ...)`.

Slots

- `mainGraph`: Object of class "graph". Holds the graph describing the relationships between the annotations
- `subGraph`: Object of class "list". Not currently used
- `mainTable`: Object of class "data.frame". Table of results, with all the various statistics for each annotation in the category
- `allAnnotation`: Object of class "list". For each annotation, which genes from which comparison are annotated to that particular annotation
- `categoryName`: Object of class "character". Which category (e.g. GO, KEGG, etc) was used
- `ontology`: Object of class "character". If GO, which ontology was used

Methods

- `allAnnotation` signature(object = "ccCompareResult"): ...
- `mainGraph` signature(object = "ccCompareResult"): ...
- `mainTable<-` signature(object = "ccCompareResult"): ...

Author(s)

`ccCompare ccCompareCollection`

Examples

`showClass("ccCompareResult")`
**ccData**

Test data for categoryCompare

---

**Description**

Processed data from the estrogen example data set

**Usage**

data(ccData)

**Format**

- `table10`: Log-ratio output from **limma** for the comparison of presence-absence of estrogen at 10 hours
- `table48`: Log-ratio output from **limma** for the comparison of presence-absence of estrogen at 48 hours
- `gUniverse`: All of the genes measured on the chip
- `gseaRes`: Toy results of GSEA analysis of 3 different tissues
- `enrichLists`: Apply **ccEnrich** to a ccGeneList from `table10` and `table48`
- `ccResults`: Apply **ccCompare** to `enrichLists`
- `ccResultsBPHier`: Modify `enrichLists$BP` to use a "hierarchical" layout
- `geneLists`: a ccGeneList generated from genes in `table10` and `table48`
- `ccOpts`: a ccOptions object describing what we are going to do as far as feature list comparisons

**Author(s)**

Robert M Flight

**Source**

Taken from the **estrogen** package in Bioconductor, and then processed using the normal **affy** and **limma** tools.

**Examples**

data(ccData)
ccEnrich-method

Perform annotation enrichment for multiple gene lists

Description
Takes a ccGeneList object containing all the information needed to perform enrichment calculations for Gene Ontology.

Usage
ccEnrich(ccGeneList)

Arguments
ccGeneList A ccGeneList object, which is really just a list of lists, with some extra slots to tell us how to examine results. Each entry in the list should be named to allow identification later on. Each sub list should contain a vector genes denoting the genes of interest, a vector universe denoting the gene background (i.e. all genes on the chip), and an entry annotation denoting an organism database package (such as org.Hs.eg.db). See ccGeneList for more details regarding this object.

Details
This function is essentially a wrapper for hyperGTestCC that performs all of the calculations for the many gene lists in one go, returning a list of HyperGResultCC objects, one for each of the ccTypes and each gene list. These various HyperGResultCC objects can then be accessed and results compared among the lists for each of the ontologies.

Value
A list of HyperGResultCC objects, one for each ccType and gene list, returned as ccEnrichResult objects for each ccType. This can be passed with a ccOptions object to ccCompare to generate actual annotation comparisons.

Author(s)
Robert M Flight

See Also

Examples
```r
## Not run:
require(GO.db)
require(KEGG.db)
require(org.Hs.eg.db)

## End(Not run)
data(ccData)
```
g10 <- (unique(table10$Entrez[1:100]))
g48 <- (unique(table48$Entrez[1:100]))
list10 <- list(genes=g10, universe=gUniverse, annotation="org.Hs.eg.db")
list48 <- list(genes=g48, universe=gUniverse, annotation="org.Hs.eg.db")
genelists <- list(T10=list10, T48=list48)
genelists <- new("ccGeneList", genelists, ccType=c("BP","KEGG"))
genelists <- new("ccGeneList", genelists, ccType=c("CC","KEGG"))

# set number of fdr runs to 0 to speed up runtime, not generally recommended.
genelists <- new("ccGeneList", genelists, ccType = c('BP','KEGG'), pvalueCutoff=0.01, fdr=0)
# enrichLists <- ccEnrich(genelists)

cceickenrichcollection-class

Class "ccEnrichCollection"

Description

Holds multiple classes of ccEnrichResult in one object to allow ccCompare to work on only the one object and generate all of the results of a comparison.

Objects from the Class

Objects can be created by calls of the form new("ccEnrichCollection", ...).

Slots

.Data: Object of class "list"

.names: Object of class "character" The names (generally GO ontologies or KEGG, but can be changed) of each set of results

Extends

Methods

pvalueCutoff<- signature(r = "ccEnrichCollection"): Changes the pvalueCutoff to be used to decide significant annotations for all of the contained ccEnrichResult objects

pvalueType<- signature(object = "ccEnrichCollection"): Changes whether to use p-values or fdr values to determine those annotations that are significant in all of the contained ccEnrichResult objects

minCount<- signature(object = "ccEnrichCollection"): how many features have to be annotated to a term to be reported as significant

graphType signature(object = "ccEnrichCollection"): Gets the type of graph that should be output for this collection

ccEnrichResult-class Class "ccEnrichResult"

Description
Acts as a container object for multiple HyperGResultCC objects.

Objects from the Class
Objects can be created by calls of the form new("ccEnrichResult", ...).

Extends

Methods
fdr signature(object = "ccEnrichResult"): get the number of runs using random feature lists were performed
pvalueCutoff signature(r = "ccEnrichResult"): what is the pvalueCutoff to determine significant annotations
pvalueCutoff<- signature(r = "ccEnrichResult"): change the pvalueCutoff for an annotation to be considered significant
pvalueType<- signature(object = "ccEnrichResult"): change whether p-values used are from "FDR" or raw p-values
minCount signature(object = "ccEnrichResult"): how many features need to belong to an annotation to be reported
minCount<- signature(object = "ccEnrichResult"): adjust the minCount
graphType signature(object = "ccEnrichResult"): what type of graph should be generated (generally set by the class of object)
graphType<- signature(object = "ccEnrichResult"): change the type of graph to generate by ccCompare

Author(s)
Robert M Flight
Examples

data(ccData)
enrichRes <- enrichLists[[1]]
fdr(enrichRes)
pvalueType(enrichRes)
enrichRes
pvalueType(enrichRes) <- 'pval'
enrichRes

pvalueCutoff(enrichRes)
pvalueCutoff(enrichRes) <- 0.01
enrichRes

ccGeneList-class

Class "ccGeneList"

Description

This stores the actual gene lists and related information that will be used in categoryCompare.

Objects from the Class

Objects can be created by calls of the form new("ccGeneList", list)). ccGeneList is actually just an extension of R list objects. The input list should be a list of lists. See Details for more information.

Slots

fdr: Object of class "numeric" The number of fdr runs to perform to account for different list sizes and term dependence

pvalueCutoff: Object of class "numeric" Value used to determine whether or not a particular term is significant or not

cctype: Object of class "character" What types of annotations to use. Currently supported ones include "BP", "MF", "CC" (from Gene Ontology) and "KEGG"

testDirection: Object of class "character" Are you interested in "over" or "under" represented annotations

Methods

fdr signature(object = "ccGeneList"): how many random runs to perform

fdr<- signature(object = "ccGeneList"): change the number of random runs

pvalueCutoff signature(object = "ccGeneList"): what is the pvalue to consider significant

pvalueCutoff<- signature(object = "ccGeneList"): change the cutoff for significance

cctype signature(object = "ccGeneList"): what type of annotations are going to be examined

ccType<- signature(object = "ccGeneList"): change the type of annotations to examine

testDirection signature(object = "ccGeneList"): query for "over" or "under" represented annotations

testDirection<- signature(object = "ccGeneList"): change the type of representation ("over" or "under")

listNames signature(object = "ccGeneList"): what are the names of the lists contained
Details

The input list should be a list of lists, with at least three sub-lists.

```r
testList <- list(list1=list(genes='...', universe='...', annotation='...'), list2=list(...))
```

genes: These are the gene identifiers of the genes that are of interest (differentially expressed genes)

universe: All of the genes that were measured in this particular experiments (i.e. all the genes on the chip)

annotation: What organism or chip do these ID’s come from (e.g. "org.Hs,eg.db" for Human Entrez gene ID’s, "hgu133a.db" for probe ID’s from the Affymetrix U133A chip)

data: A data-frame that contains extra information about the genes of interest. At the very least, the data-frame must have a column ID that matches the ID’s contained in genes

What actually happens when running ccEnrich is that the appropriate HyperGParamsCC objects are generated for each geneList and each type of annotation (e.g. BP, CC, KEGG), and then the calculations performed on each one.

Note

The ccGeneList object is what will undergo all of the enrichment calculations. When the results are combined with the ccOptions object, we can get our results of actual comparisons between experiments.

ccOptions

Examples

```r
data(ccData)
g10 <- (unique(table10$Entrez[1:100]))
g48 <- (unique(table48$Entrez[1:100]))
list10 <- list(genes=g10, universe=gUniverse, annotation="org.Hs,eg.db")
list48 <- list(genes=g48, universe=gUniverse, annotation="org.Hs,eg.db")
genelists <- list(T10=list10, T48=list48)
genelists <- new("ccGeneList", geneLists, ccType=c("BP","KEGG"))
genelists
```
Class "ccOptions"

Description

These objects store the various options required by categoryCompare for actually making comparisons and generating output.

Objects from the Class

Objects can be created by calls of the form `new("ccOptions", listNames=c('list1','list2',etc)). This is the minimum call required, and will generate a ccOptions object where comparisons are assumed between all the lists supplied. See the examples section for more examples of how to initialize new objects.

Slots

- `listNames`: Object of class "character" The actual names of the various datasets defined in the ccData object
- `compareNames`: Object of class "character" Which lists to compare, each entry should be a comma separated list
- `compareIndx`: Object of class "list" List indices for each of the comparison, not usually set by the user. Generated automatically.
- `compareColors`: Object of class "character" For graphical and tabular output each comparison can be colored. Should be one color for each comparison. Can be either an n by 3 matrix of rgb triples, or a character vector of hexadecimal color codes, or character vector of color names ("red","green","blue", etc)
- `cssClass`: Object of class "character" Classnames used when generating HTML tables to color entries. Generated automatically upon initialization, or modifying compareNames
- `outType`: Object of class "character" Sets the type of output generated by ccTables. Valid types are "html", "text", "cytoscape" or "none", default is "text" when the ccOptions object is initialized without an outType specified.

Methods

- `compareColors` signature(object = "ccOptions"): ...
- `compareColors<-` signature(object = "ccOptions"): ...
- `compareIndx` signature(object = "ccOptions"): ...
- `compareNames` signature(object = "ccOptions"): ...
- `compareNames<-` signature(object = "ccOptions"): ...
- `cssClass` signature(object = "ccOptions"): ...
- `listNames` signature(object = "ccOptions"): ...
- `listNames<-` signature(object = "ccOptions"): ...

- `outType<-` signature(object = "ccOptions"): ...
Author(s)

Robert M Flight

Examples

```r
showClass("ccOptions")
## A very basic "ccOptions" for a comparison of two sets of data, "list1" and "list2"
c1 <- new("ccOptions", listNames=c('list1','list2'))
c1

## Now lets get a little more complicated
c1 <- new("ccOptions", listNames=c('list1','list2'), compareNames=c('list1,list2','list1,list3'), compareColors=c(red,blue))
c1

# set the type of output you want to eventually produce
c1 <- new("ccOptions", listNames=c('list1','list2'), outType='html')
c1

c1 <- new("ccOptions", listNames=c('list1','list2'), outType=c('html','text','none'))
c1

## Using RGB colors
ccCols <- matrix(c(255,0,0, 0,0,255), nrow=2, ncol=3)
c1 <- new("ccOptions", listNames=c('list1','list2','list3'), compareNames=c('list1,list2','list1,list3'), compareColors=ccCols)
c1

## Using Hex colors
ccCols <- c("#FF0000", "#0000FF")
c1 <- new("ccOptions", listNames=c('list1','list2','list3'), compareNames=c('list1,list2','list1,list3'), compareColors=ccCols)
c1

## or even using a color palette from R. Note that you need at least enough colors to cover all of individual and possible permutations (n!) if you use compareNames="all"
c1 <- new("ccOptions", listNames=c('list1','list2','list3'), compareNames=c('list1,list2','list1,list3'), compareColors=rainbow(4))
c1
```

ccOutCyt-methods

Methods for Function ccOutCyt in Package categoryCompare

Description

Passes a ccCompareResult object to Cytoscape for interactive visualization of ccCompare results.

Details

Note that only some basic, required methods have been imported from RCytoscape for use with categoryCompare, and these are hidden in the functions within categoryCompare and are not visible to the user. If access to all the functionality of RCytoscape is desired (and trust me, there is a lot of useful stuff in there), then the user should use library(RCytoscape) directly.
Methods
signature(ccCompRes = "ccCompareResult", ccOpts = "ccOptions", ...) At a minimum, this method requires a ccCompareResult and a ccOptions to work. ... may include:
  layout = "character" to override the default layout set by ccCompare, as well as options
  postText = "character" to add a user set string to the Cytoscape window
In addition, any of the arguments to CytoscapeWindow may also be set, such as host or port.

See Also
ccCompareResult ccOptions ccCompare CytoscapeWindowClass

Examples
## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") { (length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0)})

if hasCy {
  ccResults$BP <- breakEdges(ccResults$BP, 0.8)
  cwObj <- ccOutCyt(ccResults$BP, ccOpts)
  Sys.sleep(10)
  RCytoscape::deleteWindow(cwObj)
}
## End(Not run)

### Description
Holds a generic list of significant annotations. Allows one to use Bioconductor annotation packages, or when combined into a GENccEnrichResult, use custom annotation / gene mappings.

### Objects from the Class
Objects can be created by calls of the form new("ccSigList", ...).

### Slots
sigID: Object of class "character"
categoryName: Object of class "character"
onontology: Object of class "character"
annotation: Object of class "character"

### Methods
annotation signature(object = "ccSigList"): ...
category signature(object = "ccSigList"): ...
onontology signature(object = "ccSigList"): ...
sigID signature(object = "ccSigList"): ...
Author(s)
Robert M Flight

cwReload-methods

Methods for Function cwReload in Package categoryCompare

Description
Methods for function cwReload in package categoryCompare

Methods
signature(oldCW = "CytoscapeWindowClass", windowName = "character", ccOpts = "ccOptions")

cytOutData-methods

Methods for Function cytOutData

Description
Takes the saveObj generated by cytOutNodes and writes the data to a file

Value
A text file with the annotations previously saved using cytOutNodes

Methods
signature(saveObj = "list", compareResult = "ccCompareResult", mergedData = "mergedData")
saveObj is the list object generated by cytOutNodes, compareResult is the object from ccCompare, and mergedData is created using mergeLists, but is optional.
...: optional arguments also include: orgType, default is "header" where each group is separate, "annotate" pushes all the data into one table with a new column that designates which groups the annotation was found in; fileName, the name of a text file to output the results to; displayFile, whether or not to display the file (default is "FALSE")
Examples

## Not run:

```r
hasCy <- (if (.Platform$OS.type %in% "windows") { (length(grep("Cytoscape", system("tasklist", intern=TRUE))))})

if hasCy {
  data(ccData)
  ccResults$BP <- breakEdges(ccResults$BP, 0.8)
  cwObj <- ccOutCyt(ccResults$BP, ccOpts)
  # user selects some nodes in Cytoscape
  RCytoscape::selectNodes(cwObj, c("GO:0007017", "GO:0000226", "GO:0007051", "GO:0007052"))
  savedNodes <- cytOutNodes("random1", cwObj) # save them
  # and selects some other nodes
  RCytoscape::selectNodes(cwObj, c("GO:0071103", "GO:0034728", "GO:0006323", "GO:0030261", "GO:0006334"), preserve.current.selection=FALSE)
  savedNodes <- cytOutNodes("random2", cwObj, savedNodes)

  # now spit results out to a file
  cytOutData(savedNodes, ccResults$BP)
}
```

## End(Not run)
Description

Queries or sets the number of random runs to perform to generate an estimate of the false discovery rate. Defaults to 50

Usage

fdr(object)

Arguments

object Can be ccGeneList, HyperGParamsCC, HyperGResultCC, ccEnrichResult See Details for more information.

Details

fdr(object) gets the number of fdr runs for ccGeneList, HyperGParamsCC, HyperGResultCC, ccEnrichResult

fdr(object) <- will set the number of fdr runs to be used by ccEnrich and HyperGTestCC when performing calculations on either a ccGeneList or HyperGParamsCC, respectively

ccEnrichCol <- new("GENccEnrichResult", ccEnrichCol, categoryName="KEGG")
getGeneSymbol

Entrez to name, symbol, GO and path conversion, as well as general ID to ID conversion.

Description

Get different attributes for the Entrez gene IDs

Usage

getGeneSymbol(id, annPackage)
geneName(id, annPackage)
geneGO2ALLEGS(id, annPackage)
genePATH2EG(id, annPackage)
geneAnnotation(id, annPackage, mapID, doUnlist=TRUE)

Arguments

id The IDs one wants to get information for.
annPackage Which annotation package to use.
mapID Which mapping to use
doUnlist should the results be unlisted or not?

Details

The type of ID will change depending on the function. For getGene... the ID should be Entrez IDs. For geneGO2ALLEGS Gene Ontology IDs should be used, and for genePATH2EG KEGG pathways IDs should be used. For geneAnnotation, any ID can be used.

Value

Returns the requested information.

Note

These functions are generally called internally for mapping between genes and various objects.

Author(s)

Robert M Flight
**graphType-methods**

**Description**

Gets and sets the `graphType` for a couple of different `ccEnrichResults` objects

**Methods**

```r
signature(object = "ccEnrichResult")
signature(object = "GENccEnrichResult")
```

**See Also**

`ccEnrichResult` `GENccEnrichResult`

---

**HyperGParamsCC-class**

**Class** "HyperGParamsCC"

**Description**

This class extends the `HyperGParams` class in `Category` by providing options for multiple testing and the storing of extra data in addition to the gene list of interest (not currently used, but might be in the future).

**Objects from the Class**

Objects can be created by calls of the form `new("HyperGParamsCC", ...)`. In general the user will not create these directly, but they are created and used by to carry out the enrichment calculations.

**Slots**

- `fdr`: Object of class "numeric" The number of FDR runs to perform
- `data`: Object of class "data.frame" Extra data stored in the object
- `geneIds`: Object of class "ANY" The genes of interest
- `universeGeneIds`: Object of class "ANY" The gene universe or background used (all the genes on the chip)
- `annotation`: Object of class "character" The annotation package used to get information about the geneIds
- `datPkg`: Object of class "DatPkg" Generated automatically from the annotation slot
- `categorySubsetIds`: Object of class "ANY" A specific set of category IDs that one wants to restrict the testing to
- `categoryName`: Object of class "character" What type of category to use, currently either "GO" or "KEGG"
- `pvalueCutoff`: Object of class "numeric" What should be the p-value to decide significance
- `testDirection`: Object of class "character" "over" or "under" represented annotation terms
HyperGResultCC-class

Extends

Class "GOHyperGParams", directly.

Methods

No methods defined with class "HyperGParamsCC" in the signature.

Author(s)

Robert M Flight

See Also

HyperGResultCC ccEnrich Category-package

Examples

showClass("HyperGParamsCC")

Description

Contains the results of performing a hypergeometric test on a HyperGParams object.

Objects from the Class

Objects can be created by calls of the form new("HyperGResultCC", ...).

Slots

fdr: Object of class "numeric" The number of FDR runs performed
fdrvalues: Object of class "numeric" The FDR values generated
pvalueType: Object of class "character" Whether to use p-values or FDR values in determining the significant terms returned
data: Object of class "data.frame" Extra data
pvalues: Object of class "numeric" P-values calculated for each term
oddsRatios: Object of class "numeric"
expectedCounts: Object of class "numeric"
catToGeneId: Object of class "list"
organism: Object of class "character"
annotation: Object of class "character"
geneIds: Object of class "ANY"
testName: Object of class "character"
pvalueCutoff: Object of class "numeric"
testDirection: Object of class "character"
Extends

Class "HyperGResult", directly. Class "HyperGResultBase", by class "HyperGResult", distance 2.

Methods

  fdr  signature(object = "HyperGResultCC"):
  fdrvalues signature(object = "HyperGResultCC"):
  pCC  signature(object = "HyperGResultCC"):
  pvalueCutoff<- signature(r = "HyperGResultCC"):
  pvalueType signature(object = "HyperGResultCC"):
  pvalueType<- signature(object = "HyperGResultCC"):

See Also

hyperGTestCC

Examples

showClass("HyperGResultCC")

---

**hyperGTestCC**

*Hypergeometric testing with false discovery rate*

Description

Performs the hypergeometric testing for HyperGParamsCC objects.

Usage

`hyperGTestCC(p)`

Arguments

- `p` A HyperGParamsCC object

Details

This is the heart of categoryCompare, the function that calculates the HyperGeometric statistics for the given categories of annotation for each gene list.

Value

Returns a HyperGResultCC object
### listNames

**Description**

Extracts the `listNames` from `ccGeneList` or `ccOptions` objects.

**Usage**

```r
listNames(object)
```

**Arguments**

- `object` This will be either a `ccGeneList` or `ccOptions` object

**Author(s)**

Robert M Flight

**See Also**

`ccGeneList` `ccOptions`
Description
Stores merged data tables from the "data" entry in a ccGeneList. This is useful for output later.

Objects from the Class
Objects can be created by calls of the form new("mergedData", ...).

Slots
.Data: Object of class "list"
useIDName: Object of class "character"
names: Object of class "character"
row.names: Object of class "data.frameRowLabels"
.S3Class: Object of class "character"

Extends
Class "data.frame", directly. Class "list", by class "data.frame", distance 2. Class "oldClass", by class "data.frame", distance 2. Class "data.frameOrNULL", by class "data.frame", distance 2. Class "vector", by class "data.frame", distance 3.

Methods
signature(saveObj = "list", compareResult = "ccCompareResult", mergedData = "mergedData")

Author(s)
Robert M. Flight

See Also
mergeLists cytOutData

Examples
showClass("mergedData")
data(ccData)
mergeDat <- mergeLists(geneLists, ccOpts)
mergeLists-methods

Function mergeLists in Package categoryCompare

Description

Merges the gene lists or the data tables from a ccGeneList object, providing a single table with all the input data, that can then be queried later, using cytTableOut.

Usage

mergeLists(ccGeneList, ccOptions, isGene = TRUE)

Arguments

  ccGeneList  a ccGeneList object
  ccOptions   a ccOptions object
  isGene      are the identifiers genes, or something else (metabolites, etc)

Value

A mergedData object which is really just a glorified data frame. If the ccGeneList input had a data list, then these are all merged into a single table. Otherwise, it contains just the gene names and which list they were present in.

Methods

signature(ccGeneList = "ccGeneList", ccOptions = "ccOptions")

See Also

ccGeneList ccOptions mergedData

Examples

data(ccData)
  g10 <- unique(table10$Entrez[1:100])
  g48 <- unique(table48$Entrez[1:100])

  list10 <- list(genes = g10, universe = gUniverse, annotation = "org.Hs.eg.db", data = table10[1:100,])
  list48 <- list(genes = g48, universe = gUniverse, annotation = "org.Hs.eg.db", data = table48[1:100,])

  geneLists <- list(T10 = list10, T48 = list48)
  genelists <- list(T10 = list10, T48 = list48)
  genelists <- new("ccGeneList", genelists, ccType = c("BP", "KEGG"))

  ccOpts <- new("ccOptions", listNames = names(geneLists))
  mergedDat <- mergeLists(geneLists, ccOpts)

  list10 <- list(genes = g10, universe = gUniverse, annotation = "org.Hs.eg.db")
  list48 <- list(genes = g48, universe = gUniverse, annotation = "org.Hs.eg.db")

  mergedLists <- list(T10 = list10, T48 = list48)
  mergedLists <- new("ccGeneList", mergedLists, ccType = c("BP", "KEGG"))
  ccOpts <- new("ccOptions", listNames = names(mergedLists))
  mergedDat <- mergeLists(mergedLists, ccOpts)
minCount

Description
Extracts and sets the minimum number of genes that an annotation must have to be considered in subsequent steps.

Usage
minCount(object)

Arguments
object
This will be either a HyperGResultCC, ccEnrichResult, or ccEnrichCollection object. See Details for more information.

Details
minCount(object) fetches the set minCount for HyperGResultCC and ccEnrichResult objects
minCount(object)<- will set the minCount for HyperGResultCC objects, and when applied to ccEnrichResult and ccEnrichCollection sets the minCount for all of the contained objects, so be careful if you want to use different minCounts for different results

Author(s)
Robert M Flight

See Also
HyperGResultCC ccEnrichResult ccEnrichCollection

Examples
data(ccData)
enrichLists
minCount(enrichLists) <- 5
enrichLists

---

minNodes

Delete nodes with less than a certain number of genes annotated

Description
Deletes from the graph those annotations with less than a certain number of genes

Usage
minNodes(cwObj, cutoff)
pvalueType

Arguments

cwObj a CytoscapeWindowClass object returned from ccOutCyt
cutoff the minimum number of genes that an annotation must have

Author(s)

Robert M Flight

See Also

CytoscapeWindowClass ccOutCyt

Examples

## Not run:
hasCy <- (if (.Platform$OS.type %in% "windows") { (length(grep("Cytoscape", system("tasklist", intern=TRUE))) > 0)})

if hasCy {
  data(ccData)
  ccResults$BP <- breakEdges(ccResults$BP, 0.8)
  cwObj <- ccOutCyt(ccResults$BP, ccOpts)
  minNodes(cwObj, 5)
}
## End(Not run)

pvalueType Type of p-values to return from object

Description

Queries or sets the type of p-values to return from objects, either base calculated (pvals) or from fdr calculations (fdr)

Usage

pvalueType(object)

Arguments

object Can be HyperGResultCC, ccEnrichResult, ccEnrichCollection. See Details for more information

Details

pvalueType(object) gets the type of p-values to be returned from HyperGResultCC and ccEnrichResult objects
pvalueType(object) <- will set the type of p-values to be returned from HyperGResultCC, ccEnrichResult, ccEnrichCollection. Note that for a ccEnrichCollection, the type is changed for all contained ccEnrichResults
resetColors-methods

Author(s)
Robert M Flight

See Also
HyperGResultCC ccEnrichResult ccEnrichCollection

Examples
# pvalueType-Methods
data(ccData)

## Not run: pvalueType(enrichLists) # this returns an error
pvalueType(enrichLists[[1]])
pvalueType(enrichLists[[1]][[1]])

# change the type for one of the results
pvalueType(enrichLists[[1]]) <- 'pval' # note, I do not recommend changing it for a single result in a category
enrichLists

# change for all of the results
pvalueType(enrichLists) <- 'pval'
enrichLists

resetColors-methods  resetColors

Description
If the color of particular nodes have been modified from the original color scheme in ccOptions, this will reset them

Methods
signature(cwObj = "CytoscapeWindowClass", ccOpts = "ccOptions") What CytoscapeWindow to apply this to, and what ccOptions to use for the color scheme.

Optional Arguments: Note that optional arguments include node.attribute.name (default is 'fillcolor') and mode (default is 'lookup')

Note
This is most commonly used with the cwReload function, as the color scheme of the network does not get saved in the CYS file.

Author(s)
Robert M Flight

See Also
CytoscapeWindowClass ccOptions setNodeColorRule cwReload
Methods for Function `show` in Package ‘categoryCompare’

Description

The `show` and `summary` methods for `HyperGResultCC` objects generated using `hyperGTestCC`.

Methods

- `show`, signature(object = "HyperGResultCC")
- `summary`, signature(object = "HyperGResultCC")

Author(s)

Robert M Flight

Examples

```r
## Not run:
data(ccData)
show(enrichLists)
summary(enrichLists[[1]][[1]])
## End(Not run)
```
