Package ‘domainsignatures’

March 28, 2017

Type Package

Title Geneset enrichment based on InterPro domain signatures

Version 1.34.0

Author Florian Hahne, Tim Beissbarth

Maintainer Florian Hahne <florian.hahne@novartis.com>

Description Find significantly enriched gene classifications in a list of functionally unde-
scribed genes based on their InterPro domain structure.

Depends R (>= 2.4.0), KEGG.db, prada, biomaRt, methods

Imports AnnotationDbi

License Artistic-2.0

LazyLoad yes

Author(s)

Florian Hahne, Tim Beissbarth
Maintainer: Florian Hahne <f.hahne@dkfz.de>

Description

This function creates the necessary annotation object of class `ipDataSource` containing the pathway and InterPro ID mappings.

Usage

```r
dataSource(mapping, type = "generic")
```

Arguments

- `mapping`: A named list providing a mapping between entrezgene identifiers and arbitrary groupings of genes or pathways.
- `type`: The type of pathway. A character skalar.

Details

For genes without pathway membership, `NA` list items need to be included in `mapping`. The names of the list comprise the gene universe to test against. The function will access the ensembl biomaRt database in order to retrieve the necessary InterPro domain information.
getKEGGdata

Value
Object of class ipDataSource

Author(s)
Florian Hahne

See Also
gseDomain, getKEGGdata

Examples

```r
if(interactive())
{
grounging <- list("653361"="pw1", "729230"="pw1", "415117"="pw3")
dataSource(grounging)
}
```

Description
Get all available KEGG annotations and InterPro domains for a set of entrezgene identifiers from the KEGG annotation package and from the ensembl biomaRt.

Usage

```r
getKEGGdata(universe=NULL, pathways=NULL, ensemblMart="hsapiens_gene_ensembl")
```

Arguments

- **universe**: Character vector of entrezgene identifiers. This is the global universe of genes to test against.
- **pathways**: Optional character vector of KEGG pathway identifiers. This can be used in order to test for over-representation of only a subset of all the available KEGG pathways.
- **ensemblMart**: Character giving the type of Biomart to use. Defaults to Human Ensembl.

Details
This function is a wrapper around the KEGG annotation package and a customized query of the ensembl biomaRt database. For the gene identifiers in universe and all or a selection of KEGG pathways it will fetch the necessary information and create an object of class ipDataSource which can later be used as input to gseDomain.

Value
An object of class ipDataSource.
Description

Get description of KEGG pathways from a list of KEGG identifiers.

Usage

goingKEGGdescription(ids)

Arguments

ids Character vector of KEGG identifiers

Value

Character vector of KEGG descriptions

Author(s)

Florian Hahne

Examples

goingKEGGdescription("hsa03050")
Description

Compute the similarity to pathways specified through dataSource for a set of entrezgene identifiers.

Usage

```
gseDomain(dataSource, geneset, n=10000, verbose=TRUE, samples=FALSE)
```

Arguments

- `dataSource`: Object of class `ipDataSource` containing pathway and InterPro domain mappings
- `geneset`: Character vector of entrezgene identifiers
- `n`: Number of subsampling iterations
- `verbose`: Toggle progress report
- `samples`: Logical indicating whether to return the similarity measures for all the resamples.

Details

Use this function to compute p-values for similarity of the domain signature of a gene set to all signatures of the pathways defined in dataSource. You should have created dataSource using either function `dataSource` or `getKEGGdata`.

Value

A list with items

- `similarity`: Named vector of similarity measures for each pathway
- `pvalue`: The p-values of similarity to each pathway. A named vector.

and optional item (if `samples=TRUE`)

- `dist`: A named list containing similarity measures for all the resamples

Florian Hahne

See Also

- `gseDomain`

Examples

```
## see Vignette of this package for examples how to use this function
```
A class to store mapping information between genes, pathways and interPro domains

Description

This class represents the data necessary to run gseDomain.

Details

You should always create these objects using either one of the functions dataSource or getKEGGdata.

Creating Objects

Objects can be created using
new('ipDataSource',
genes = ...., # Object of class character
pathways = .... # Object of class character
domains = .... # Object of class character
gene2Domains = .... # Object of class environment
path2Domains = .... # Object of class environment
type = ...., # Object of class character
)
or the functions dataSource or getKEGGdata.

Slots

genes: Vector of unique entrezgene identifiers
pathways: Vector of unique pathway identifiers
domains: Vector of unique InterPro identifiers
gene2Domains: Hash table mapping entrezgene IDs to Interpro IDs
path2Domains: Hash table mapping pathway IDs to InterPro IDs
type: Type of pathway. A character skalar
dims: Numeric vector of dimensions

Methods

show display summary.
