addAMDISPeaks

Description

Reads ASCII ELU-format files (output from AMDIS) and attaches them to an already created peaksDataset object

Usage

addAMDISPeaks(object, fns = dir(,"[Eu][Ll][Uu]"), verbose = TRUE, ...)

Arguments

object a peaksDataset object.
fns character vector of same length as object$rawdata (user ensures the order matches)
verbose whether to give verbose output, default TRUE
... arguments passed on to parseELU

Details

Repeated calls to parseELU to add peak detection results to the original peaksDataset object.

Value

peaksDataset object

Author(s)

Mark Robinson

References

addChromaTOFPeaks  Add ChromaTOF peak detection results

Description

Reads ASCII tab-delimited format files (output from ChromaTOF) and attaches them to an already created peaksDataset object

Usage

addChromaTOFPeaks(object,fns=dir(,"[Tt][Xx][Tx]"),rtDivide=60,verbose=TRUE,...)

Arguments

  object a peaksDataset object.
  fns character vector of same length as object@rawdata (user ensures the order matches)
  rtDivide number giving the amount to divide the retention times by.
  verbose whether to give verbose output, default TRUE
  ... arguments passed on to parseChromaTOF

Details

Repeated calls to parseChromaTOF to add peak detection results to the original peaksDataset object.

Value

  peaksDataset object

Author(s)

  Mark Robinson
addXCMSPeaks

References

parseChromaTOF, peaksDataset

Examples

```r
# need access to CDF (raw data) and ChromaTOF files
tk <- require(gcspikelite)
gcmsPath <- paste(find.package("gcspikelite"), "data", sep = "/")

gcmsPath <- paste(find.package("gcspikelite"), "data", sep = "/")

cdfFiles <- dir(gcmsPath, "CDF", full = TRUE)

# [not run] cTofFiles <- dir(gcmsPath, "txt", full = TRUE)

# create a 'peaksDataset' object and add ChromaTOF peaks to it
d <- peaksDataset(cdfFiles[1], mz = seq(50, 550), rtrange = c(7.5, 8.5))
# [not run] d <- addChromTOFPeaks(d,...)
```

addXCMSPeaks

Add xcms/CAMERA peak detection results

Description

Reads the raw data using xcms, group each extracted ion according to their retention time using CAMERA and attaches them to an already created peaksDataset object

Usage

```r
addXCMSPeaks(files, object, peakPicking = c('cwt', 'mF'), ...)
```

Arguments

- `files` character vector of same length as `object@rawdata` (user ensures the order matches)
- `object` a `peaksDataset` object.
- `peakPicking` Methods to use for peak detection. See details.
- `...` arguments passed on to xcmsSet and annotate

Details

Repeated calls to xcmsSet and annotate to perform peak-picking and deconvolution. The peak detection results are added to the original `peaksDataset` object. Two peak detection algorithms are available: continuous wavelet transform (`peakPicking = c('cwt')`) and the matched filter approach (`peakPicking = c('mF')`) described by Smith et al (2006). For further information consult the xcms package manual.
Value

peaksDataset object

Author(s)

Riccardo Romoli <riccardo.romoli@unifi.it>

peaksDataset findPeaks.matchedFilter findPeaks.centWave xcmsRaw-class

Examples

# need access to CDF (raw data)
require(gcspikelite)
gcmsPath <- paste(find.package("gcspikelite"), "data", sep="/"

# full paths to file names
cdfFiles <- dir(gcmsPath, "CDF", full=TRUE)

# create a 'peaksDataset' object and add XCMS peaks to it
pd <- peaksDataset(cdfFiles[1], mz=seq(50,550), rtrange=c(7.5,8.5))
pd <- addXCMSPeaks(cdfFiles[1], pd, peakPicking=c("mF"),
                   snthresh=3, fwhm=4, step=1, steps=2, mzdiff=0.5)

betweenAlignment

Data Structure for "between" alignment of many GCMS samples

Description

This function creates a "between" alignment (i.e. comparing merged peaks)

Usage

betweenAlignment(pD,cAList,pAList,impList,filterMin=3,gap=0.7,D=10,usePeaks=TRUE,df=30,verbose=TRUE)

Arguments

pD a peaksDataset object
cAList list of clusterAlignment objects, one for each experimental group
pAList list of progressiveAlignment objects, one for each experimental group
impList list of imputation lists
filterMin minimum number of peaks within a merged peak to be kept in the analysis
gap gap parameter
D retention time penalty parameter
usePeaks logical, whether to use peaks (if TRUE) or the full 2D profile alignment (if FALSE)
df distance from diagonal to calculate similarity
verbose logical, whether to print information
Details

*betweenAlignment* objects gives the data structure which stores the result of an alignment across several "pseudo" datasets. These pseudo datasets are constructed by merging the "within" alignments.

Value

*betweenAlignment* object

Author(s)

Mark Robinson

Examples

```r
require(gcspikelite)
# see 'multipleAlignment'
```

---

**calcTimeDiffs**

*Calculate retention time shifts from profile alignments*

Description

This function takes the set of all pairwise profile alignments and use these to estimate retention time shifts between each pair of samples. These will then be used to normalize the retention time penalty of the signal peak alignment.

Usage

```r
calcTimeDiffs(pd, ca.full, verbose=TRUE)
```

Arguments

- `pd`: a *peaksDataset* object
- `ca.full`: a *clusterAlignment* object, fit with
- `verbose`: logical, whether to print out information

Details

Using the set of profile alignments,
Value

list of same length as ca.full@alignments with the matrices giving the retention time penalties.

peaksDataset, peaksAlignment

Examples

require(gcspikelite)

# paths and files
gcmsPath<-paste(find.package("gcspikelite"),"data",sep="/"
cddfFiles<-dir(gcmsPath,"CDF",full=TRUE)
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# read data, peak detection results
pd<-peaksDataset(cddfFiles[1:2],mz=seq(50,550),rtrange=c(7.5,8.5))
pd<-addAMDISPeaks(pd,eluFiles[1:2])

cac<-clusterAlignment(pd, gap = .5,D=.05,df=30)
**compress**

Compress an alignment object

**Description**

Many of the peaks are not similar. So, the set of pairwise similarity matrices can be compressed.

**Usage**

```r
compress(object, verbose=TRUE, ...)  
decompress(object, verbose=TRUE, ...)
```

**Arguments**

- `object`:
  - a `peaksAlignment`, `peaksAlignment` or `peaksAlignment` object to be compressed
- `verbose`:
  - logical, whether to print out information
- `...`:
  - further arguments

**Details**

Using sparse matrix representations, a significant compression can be achieved. Here, we use the `matrix.csc` class of the `SpareM` package.

**Value**

an object of the same type as the input object

**Author(s)**

Mark Robinson

require(gcspikelite)

gcmsPath<-paste(find.package("gcspikelite"),"data",sep="/"

cdfFiles<-dir(gcmsPath,"CDF",full=TRUE)
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# read data, peak detection results
pd<-peaksDataset(cdfFiles[1:2],mz=seq(50,550),rtrange=c(7.5,8.5))
```
correlationAlignment

Function for correlation-based alignment strategy of multiple GCMS samples

Description
Performs a correlation-based peak alignment of multiple GCMS peak lists; this function is able to align multiple samples, by a center-star strategy.

Usage
correlationAlignment(object, thr=0.85, D=20, penalty=0.2, normalize=TRUE, minFilter=1)

Arguments
object  a peaksDataset object
thr     correlation threshold from 0 (min) to 1 (max)
D       retention time window in seconds
penalty  the penalty inflicted to a match between two peaks when the retention time difference exceed the parameter D
normalize  logical, whether to use normalized-to-100 peaks intensity or as such
minFilter if a feature is matched in a number of samples less than minFilter, this feature is trashed. The value of minFilter must be smaller than the number of samples

Details
The correlation-based peak alignment for multiple GCMS peak lists uses a center-star technique to the alignment of the peaks. The combination of the D and penalty parameters allow the users to force the algorithm to match the peaks close to the reference. The thr parameter control the matching factor.

Value
correlationAlignment object

mp <- correlationAlignment(object=pd, thr=0.85, D=20, penalty=0.2,
                           normalize=TRUE, minFilter=1)
```

correlationAlignment-class

"correlationAlignment-class"

Description

A class containing the index of the aligned chromatographic peaks.

Objects from the Class

Objects can be created by calls of the form `new("correlationAlignment", ...)`. The object created contains both the results of the alignment procedure and the file used and as center-star.

Slots

- **Alignment**: Object of class "align" contain the matrix of the aligned features. The rows represent the different peaks while the columns represent the files. The values of the matrix refers to `peaksind` slot of the `peaksDataSet` object.
- **Center**: Object of class "character" contain the file used as a center-star.

Methods

- `show` signature(object = "correlationAlignment")

Author(s)

Riccardo Romoli <riccardo.romoli@unifi.it>

See Also

- `correlationAlignment` for further information about the alignment function.

Examples

```r
showClass("correlationAlignment")
```
Dynamic programming algorithm, given a similarity matrix

Description

This function calls C code for a bare-bones dynamic programming algorithm, finding the best cost path through a similarity matrix.

Usage

dp(M, gap=.5, big=10000000000, verbose=FALSE)

Arguments

- **M**: similarity matrix
- **gap**: penalty for gaps
- **big**: large value used for matrix margins
- **verbose**: logical, whether to print out information

Details

This is a pretty standard implementation of a bare-bones dynamic programming algorithm, with a single gap parameter and allowing only simple jumps through the matrix (up, right or diagonal).

Value

list with element `match` with the set of pairwise matches.

exportSpectra

Description
Write the deconvoluted mass spectra to an external file

Usage
exportSpectra(object, sample, spectraID, normalize = TRUE)

Arguments
object an object of class "peaksDataset" where to keep the mass spectra; both abundance (y) than m/z (x)
sample character, the sample from were to plot the mass spectra
spectraID numerical, a vector containing the index of the spectra to be plotted.
normalize logical, if TRUE normalize the intensity of the mass peak to 100, the most abundant is 100 other peaks are scaled consequetially

```r
dc<-addAMDISPeaks(pd,eluFiles[1:2])

# similarity matrix
r<-normDotProduct(pd@peaksdata[[1]],pd@peaksdata[[2]])

# dynamic-programming-based matching of peaks
v<-dp(r,gap=.5)
```
Details
Write a .msp file of the deconvoluted mass spectra. Usfull to try to identify the unknown spectra using NIST Search.

Value
a .msp file ready to be read using NIST search

Author(s)
riccardo.romoli@unifi.it

gatherInfo Gathers abundance informations from an alignment

Description
Given an alignment table (indices of matched peaks across several samples) such as that within a progressiveAlignment or multipleAlignment object, this routines goes through the raw data and collects the abundance of each fragment peak, as well as the retention times across the samples.

Usage
gatherInfo(pD, obj, newind = NULL, method = c("apex"), findmzind = TRUE, useTIC = FALSE, top = NULL, intensity.cut = 0.05)

Arguments
pD a peaksDataset object, to get the abundance data from
obj either a multipleAlignment or progressiveAlignment object
newind list giving the
method method used to gather abundance information, only apex implemented currently.
findmzind logical, whether to take a subset of all m/z indices
useTIC logical, whether to use total ion current for abundance summaries
top only use the top top peaks
intensity.cut percentage of the maximum intensity

Details
This procedure loops through the the table of matched peaks and gathers the

Value
Returns a list (of lists) for each row in the alignment table. Each list has 3 elements:

mz a numerical vector of the m/z fragments used
rt a numerical vector for the exact retention time of each peak across all samples
data matrix of fragment intensities. If useTIC=TRUE, this matrix will have a single row
imputePeaks

pd<-addAMDISPeaks(pd,eluFiles[1:2])

# multiple alignment
ma<-multipleAlignment(pd,c(1,1),wn.gap=0.5,wn.D=.05,bw.gap=0.6,bw.D=.2,usePeaks=TRUE,filterMin=1,df=50,verbose=TRUE)

# gather apex intensities
d<-gatherInfo(pd,ma)

# table of retention times
nm<-list(paste("MP",1:length(d),sep=""),c("S1","S2"))
rt<-matrix(unlist(sapply(d,.subset,"rt")),byrow=TRUE,nc=2,dimnames=nm)

imputePeaks

Imputation of locations of peaks that were undetected

Description

Using the information within the peaks that are matched across several runs, we can impute the location of the peaks that are undetected in a subset of runs.

Usage

imputePeaks(pD, obj, type = 1, obj2 = NULL, filterMin = 3, verbose = TRUE)

Arguments

pD a peaksDataset object

obj the alignment object, either multipleAlignment or progressiveAlignment, that is used to infer the unmatched peak locations
imputePeaks

- **type**: type of imputation to do, 1 for simple linear interpolation (default), 2 only works if obj2 is a clusterAlignment object
- **obj2**: a clusterAlignment object
- **filterMin**: minimum number of peaks within a merged peak to impute
- **verbose**: logical, whether to print out information

**Details**

If you are aligning several samples and for a (small) subset of the samples in question, a peak is undetected, there is information within the alignment that can be useful in determining where the undetected peak is, based on the surrounding matched peaks. Instead of moving forward with missing values into the data matrices, this procedure goes back to the raw data and imputes the location of the apex (as well as the start and end), so that we do not need to bother with post-hoc imputation or removing data because of missing components.

We realize that imputation is prone to error and prone to attributing intensity from neighboring peaks to the unmatched peak. We argue that this is still better than having to deal with these in statistical models after that fact. This may be an area of future improvement.

**Value**

A list with 3 elements apex, start and end, each masked matrices giving the scan numbers of the imputed peaks.

multipleAlignment, progressiveAlignment, peaksDataset

**Examples**

```r
require(gcspikelite)

# paths and files
gcmsPath<-paste(find.package("gcspikelite"),"data",sep="/"

cdfFiles<-dir(gcmsPath,"CDF",full=TRUE)
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# read data, peak detection results
pd<-peaksDataset(cdfFiles[1:3],mz=seq(50,550),rtrange=c(7.5,8.5))
pd<-addAMDISPeaks(pd,eluFiles[1:3])

# alignments
c<-clusterAlignment(pd, gap = .5,D=.05,df=30)
p<progressiveAlignment(pd, ca, gap = .6, D=.1,df=30)

v<imputePeaks(pd,pa,filterMin=1)
```
**multipleAlignment-class**

*Data Structure for multiple alignment of many GCMS samples*

**Description**

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs.

**Usage**

```r
multipleAlignment(pd, group, bw.gap=0.8, wn.gap=0.6, bw.D=.20, wn.D=.05, filterMin=3, lite=FALSE, usePeaks=TRUE, df=50, verbose=TRUE, timeAdjust=FALSE, doImpute=FALSE)
```

**Arguments**

- `pd`: a `peaksDataset` object
- `group`: factor variable of experiment groups, used to guide the alignment algorithm
- `bw.gap`: gap parameter for "between" alignments
- `wn.gap`: gap parameter for "within" alignments
- `bw.D`: distance penalty for "between" alignments
- `wn.D`: distance penalty for "within" alignments
- `filterMin`: minimum number of peaks within a merged peak to be kept in the analysis
- `lite`: logical, whether to keep "between" alignment details (default, FALSE)
- `usePeaks`: logical, whether to use peaks (if TRUE) or the full 2D profile alignment (if FALSE)
- `df`: distance from diagonal to calculate similarity
- `verbose`: logical, whether to print information
- `timeAdjust`: logical, whether to use the full 2D profile data to estimate retention time drifts (Note: time required)
- `doImpute`: logical, whether to impute the location of unmatched peaks

**Details**

`multipleAlignment` is the data structure giving the result of an alignment across several GCMS runs. Multiple alignments are done progressively. First, all samples with the same `tg$Group` label with be aligned (denoted a "within" alignment). Second, each group will be summarized into a pseudo-data set, essentially a spectrum and retention time for each matched peak of the within-alignment. Third, these "merged peaks" are aligned in the same progressive manner, here called a "between" alignment.

**Value**

`multipleAlignment` object

**Author(s)**

Mark Robinson

eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# read data, peak detection results
pd<-peaksDataset(cdfFiles[1:2],mz=seq(50,550),rtrange=c(7.5,8.5))
pd<-addAMDISPeaks(pd,eluFiles[1:2])

# multiple alignment
ma<-multipleAlignment(pd,c(1,1),wn.gap=0.5,wn.D=.05,bw.gap=0.6,bw.D=.2,usePeaks=TRUE,filterMin=1,df=50,verbose=TRUE)
```

## normDotProduct

**Normalized Dot Product**

### Description

This function calculates the similarity of all pairs of peaks from 2 samples, using the spectra similarity

### Usage

```r
normDotProduct(x1,x2,t1=NULL,t2=NULL,df=max(ncol(x1),ncol(x2)),D=100000,timedf=NULL,verbose=FALSE)
```

### Arguments

- `x1` data matrix for sample 1
- `x2` data matrix for sample 2
- `t1` vector of retention times for sample 1
- `t2` vector of retention times for sample 2
- `df` distance from diagonal to calculate similarity
- `D` retention time penalty
- `timedf` matrix of time differences to normalize to. if NULL, 0 is used.
- `verbose` logical, whether to print out information

### Details

Efficiently computes the normalized dot product between every pair of peak vectors and returns a similarity matrix. C code is called.
**parseChromaTOF**

**Value**

matrix of similarities

r<-normDotProduct(pd@peaksdata[[1]],pd@peaksdata[[2]])
```

**parseChromaTOF**  
*Parser for ChromaTOF files*

**Description**

Reads ASCII ChromaTOF-format files from AMDIS (Automated Mass Spectral Deconvolution and Identification System)

**Usage**

```r
parseChromaTOF(fn,min.pc=.01,mz=seq(85,500),rt.cut=.008,rtrange=NULL,skip=1,rtDivide=60)
```

**Arguments**

- **fn**  
  ChromaTOF filename to read.
- **min.pc**  
  minimum percent of maximum intensity.
- **mz**  
  vector of mass-to-charge bins of raw data table.
- **rt.cut**  
  the difference in retention time, below which peaks are merged together.
- **rtrange**  
  retention time range to parse peaks from, can speed up parsing if only interested in a small region (must be numeric vector of length 2)
- **skip**  
  number of rows to skip at beginning of the ChromaTOF
- **rtDivide**  
  multiplier to divide the retention times by (default: 60)
parseELU

Details

parseChromaTOF will typically be called by addChromaTOFPeaks, not called directly.

Peaks that are detected within rt.cut are merged together. This avoids peaks which are essentially overlapping.

Fragments that are less than min.pc of the maximum intensity fragment are discarded.

Value

list with components peaks (table of spectra – rows are mass-to-charge and columns are the different detected peaks) and tab (table of features for each detection), according to what is stored in the ChromaTOF file.

cTofList<-parseChromaTOF(tofFiles[1])

parseELU

Parser for ELU files

Description

Reads ASCII ELU-format files from AMDIS (Automated Mass Spectral Deconvolution and Identification System)

Usage

parseELU(f,min.pc=.01,mz=seq(50,550),rt.cut=.008,rtrange=NULL)
**parseELU**

**Arguments**

- `f`: ELU filename to read.
- `min.pc`: minimum percent of maximum intensity.
- `mz`: vector of mass-to-charge bins of raw data table.
- `rt.cut`: the difference in retention time, below which peaks are merged together.
- `rtrange`: retention time range to parse peaks from, can speed up parsing if only interested in a small region (must be numeric vector of length 2)

**Details**

parseELU will typically be called by `addAMDISPeaks`, not called directly.

Peaks that are detected within `rt.cut` are merged together. This avoids peaks which are essentially overlapping.

Fragments that are less than `min.pc` of the maximum intensity fragment are discarded.

**Value**

list with components `peaks` (table of spectra – rows are mass-to-charge and columns are the different detected peaks) and `tab` (table of features for each detection), according to what is stored in the ELU file.

eluList<-parseELU(eluFiles[1])
```
peaksAlignment-class  

Data Structure for pairwise alignment of 2 GCMS samples

Description

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs

Usage

peaksAlignment(d1, d2, t1, t2, gap=.5, D=1000, timedf=NULL, df=30, verbose=TRUE, usePeaks=TRUE, compress=TRUE)

Arguments

d1  
matrix of MS intensities for 1st sample (if doing a peak alignment, this contains peak apexes/areas; if doing a profile alignment, this contains scan intensities. Rows are m/z bins, columns are peaks/scans.

d2  
matrix of MS intensities for 2nd sample

t1  
vector of retention times for 1st sample

t2  
vector of retention times for 2nd sample

gap  
gap penalty for dynamic programming algorithm

D  
time penalty (on same scale as retention time differences, t1 and t2)
timedf  
list (length = the number of pairwise alignments) of matrices giving the expected time differences expected at each pair of peaks (used with usePeaks=TRUE).
df  
integer, how far from the diagonal to go to calculate the similarity of peaks. Smaller value should run faster, but be careful not to choose too low.
verbose  
logical, whether to print out info.
usePeaks  
logical, TRUE uses peakdata list, FALSE uses rawdata list for computing similarity.
compress  
logical, whether to compress the similarity matrix into a sparse format.

Details

peaksAlignment is a hold-all data structure of the raw and peak detection data.

Value

peaksAlignment object

Author(s)

Mark Robinson

References

See Also

peaksDataset, clusterAlignment
peaksDataset

### Examples

```r
# see clusterAlignment, it calls peaksAlignment
```

---

### peaksDataset

*Data Structure for raw GCMS data and peak detection results*

#### Description

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs.

#### Usage

```r
peaksDataset(fns=dir(,"[Cc][Dd][Ff]"),verbose=TRUE,mz=seq(50,550),rtDivide=60,rtrange=NULL)
```

#### Arguments

- `fns`: character vector, filenames of raw data in CDF format.
- `verbose`: logical, if `TRUE` then iteration progress information is output.
- `mz`: vector giving bins of raw data table.
- `rtDivide`: number giving the amount to divide the retention times by.
- `rtrange`: retention time range to limit data to (must be numeric vector of length 2)

#### Details

peaksDataset is a hold-all data structure of the raw and peak detection data.

#### Value

peaksDataset object

#### Author(s)

Mark Robinson

#### References

#### Examples

```r
require(gcspikelite)

# paths and files
gcmsPath<-paste(find.package("gcspikelite"),"data",sep="/"

cddfFiles<-dir(gcmsPath,"CDF",full=TRUE)
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# read data
pd<-peaksDataset(cddfFiles[1:2],mz=seq(50,550),rtrange=c(7.5,8.5))
show(pd)
```
plot.peaksDataset  

Plotting functions for GCMS data objects

Description

Store the raw data and optionally, information regarding signal peaks for a number of GCMS runs

Usage

.plotpD(object, runs=1:length(object@rawdata), mzind=1:nrow(object@rawdata[[1]]),
    mind=NULL, plotSampleLabels=TRUE, calcGlobalMax=FALSE, peakCex = 0.8, plotPeaks=TRUE,
    plotPeakBoundaries=FALSE, plotPeakLabels=FALSE, plotMergedPeakLabels=TRUE, mlwd=3,
    usePeaks=TRUE, plotAcrossRuns=FALSE, overlap=F, rtrange=NULL, cols=NULL, thin=1,
    max.near=median(object@rawrt[[1]]), how.near=50, scale.up=1, ...)
.plotpA(object, xlab="Peaks - run 1", ylab="Peaks - run 2", plotMatches=TRUE, matchPch=19, matchLwd=3,
    matchCex=.5, matchCol="black", col=colorpanel(50,"black","blue","white"),
    breaks=seq(0,1,length=51), ...)
.plotcA(object, alignment=1, ...)

Arguments

object  a peaksDataset, peaksAlignment or clusterAlignment object.
runs  for peaksDataset only: set of run indices to plot
mzind  for peaksDataset only: set of mass-to-charge indices to sum over (default, all)
mind  for peaksDataset only: matrix of aligned indices
plotSampleLabels  for peaksDataset only: logical, whether to display sample labels
calcGlobalMax  for peaksDataset only: logical, whether to calculate an overall maximum for scaling
peakCex  character expansion factor for peak labels
plotPeaks  for peaksDataset only: logical, whether to plot hashes for each peak
plotPeakBoundaries  for peaksDataset only: logical, whether to display peak boundaries
plotPeakLabels  for peaksDataset only: logical, whether to display peak labels
plotMergedPeakLabels  for peaksDataset only: logical, whether to display 'merged' peak labels
mlwd  for peaksDataset only: line width of lines indicating the alignment
usePeaks  for peaksDataset only: logical, whether to plot alignment of peaks (otherwise, scans)
plotAcrossRuns  for peaksDataset only: logical, whether to plot across peaks when unmatched peak is given
overlap  for peaksDataset only: logical, whether to plot TIC/XICs overlapping
rtrange  for peaksDataset only: vector of length 2 giving start and end of the X-axis
cols  for peaksDataset only: vector of colours (same length as the length of runs)
plot.peaksDataset

thin for peaksDataset only: when usePeaks=FALSE, plot the alignment lines every thin values
max.near for peaksDataset only: where to look for maximum
how.near for peaksDataset only: how far away from max.near to look
scale.up for peaksDataset only: a constant factor to scale the TICs
plotMatches for peaksDataset only: logical, whether to plot matches
xlab for peaksAlignment and clusterAlignment only: x-axis label
ylab for peaksAlignment and clusterAlignment only: y-axis label
matchPch for peaksAlignment and clusterAlignment only: match plotting character
matchLwd for peaksAlignment and clusterAlignment only: match line width
matchCex for peaksAlignment and clusterAlignment only: match character expansion factor
matchCol for peaksAlignment and clusterAlignment only: match colour
col for peaksAlignment and clusterAlignment only: vector of colours for colourscale
breaks for peaksAlignment and clusterAlignment only: vector of breaks for colourscale
alignment for peaksAlignment and clusterAlignment only: the set of alignments to plot
...
... further arguments passed to the plot or image command

Details

For peakDataset objects, each TIC is scaled to the maximum value (as specified by the how.near and max.near values). The many parameters give considerable flexibility of how the TICs can be visualized.

For peakAlignment objects, the similarity matrix is plotted and optionally, the set of matching peaks. clusterAlignment objects are just a collection of all pairwise peakAlignment objects.

Examples

require(gcspikelite)

# paths and files
gcmsPath<-paste(find.package("gcspikelite"),"data",sep="/"

cdfFiles<-dir(gcmsPath,"CDF",full=TRUE)
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# read data
pd<-peaksDataset(cdfFiles[1:3],mz=seq(50,550),rtrange=c(7.5,8.5))
plotImage

Plot of images of GCMS data

Description

Image plots (i.e. 2D heatmaps) of raw GCMS profile data

Usage

plotImage(object, run=1, rtrange=c(11,13), main=NULL, mzrange=c(50,200), SCALE=log2, ...)

Arguments

object a peaksDataset object
run index of the run to plot an image for
rtrange vector of length 2 giving start and end of the X-axis (retention time)
main main title (auto-constructed if not specified)
mzrange vector of length 2 giving start and end of the Y-axis (mass-to-charge ratio)
SCALE function called to scale the data (default: log2)
... further arguments passed to the image command

Details

For peakDataset objects, each TIC is scale to the maximum value (as specified by the how.near and max.near values). The many parameters gives considerable flexibility of how the TICs can be visualized.

For peakAlignment objects, the similarity matrix is plotted and optionally, the set of matching peaks. clusterAlignment objects are just a collection of all pairwise peakAlignment objects.

Examples

```r
require(gcspikelite)

# paths and files
gcmsPath<-paste(find.package("gcspikelite"),"data",sep="/"

cddfFiles<-dir(gcmsPath,"CDF",full=TRUE)
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# read data
pd<-peaksDataset(cddfFiles[1],mz=seq(50,550),rtrange=c(7.5,8.5))

# image plot
plotImage(pd,run=1,rtrange=c(7.5,8.5),main="")
```

Description

Plot the mass spectra from the profile matrix

Usage

```r
plotSpectra(object, sample, spectraID, normalize = TRUE, ...)
```

Arguments

- **object**: an object of class "peaksDataset" where to keep the mass spectra; both abundance (y) than m/z (x)
- **sample**: character, the sample from were to plot the mass spectra
- **spectraID**: numerical, a vector containing the index of the spectra to be plotted.
- **normalize**: logical, if TRUE normalize the intensity of the mass peak to 100, the most abundant is 100 other peaks are scaled consequetially
- **...**: other parameter passed to the plot() function

Details

Plot the deconvoluted mass spectra from the profile matrix

Author(s)

riccardo.romoli@unifi.it

Examples

```r
## need access to CDF (raw data)
require(gcspikelite)
gcmsPath <- paste(find.package("gcspikelite"), "data", sep="/"

## full paths to file names
cddfFiles <- dir(gcmsPath, "CDF", full=TRUE)
```
create a 'peaksDataset' object and add XCMS peaks to it
pd <- peaksDataset(cdfFiles[1:3], mz=seq(50,550), rtrange=c(7.5,8.5))  
pd <- addXCMSPeaks(cdfFiles[1:3], pd, peakPicking=c('mF'), snthresh=5,  
  fwhm=10, step=1, steps=2, mzdiff=0.5, sleep=0)

align the chromatograms
mp <- correlationAlignment(object=pd, thr=0.8, D=20,  
  penalty=0.2, normalize=TRUE, minFilter=2)

view the alignment results
mp@Alignment

plot the mass spectra
par(mfrow=c(3,1))
plotSpectra(object=pd, sample=cdfFiles[1], spectraID=2)
plotSpectra(object=pd, sample=cdfFiles[2], spectraID=3)
plotSpectra(object=pd, sample=cdfFiles[3], spectraID=4)

progressiveAlignment-class

Data Structure for progressive alignment of many GCMS samples

Description

Performs a progressive peak alignment (clustalw style) of multiple GCMS peak lists

Usage

progressiveAlignment(pD, cA, D=1000, gap=.5, verbose=TRUE, usePeaks=TRUE, df=30, compress=TRUE)

Arguments

pD a peaksDataset object
cA a clusterAlignment object
D retention time penalty
gap gap parameter
verbose logical, whether to print information
usePeaks logical, whether to use peaks (if TRUE) or the full 2D profile alignment (if FALSE)
df distance from diagonal to calculate similarity
compress logical, whether to store the similarity matrices in sparse form

Details

The progressive peak alignment we implemented here for multiple GCMS peak lists is analogous to how clustalw takes a set of pairwise sequence alignments and progressively builds a multiple alignment. More details can be found in the reference below.

Value

progressiveAlignment object
**retFatMatrix**

peaksDataset, multipleAlignment

**Examples**

```r
require(gcspikelite)

# paths and files
gcmsPath<-paste(find.package("gcspikelite"),"data",sep="/")
cdfFiles<-dir(gcmsPath,"CDF",full=TRUE)
eluFiles<-dir(gcmsPath,"ELU",full=TRUE)

# read data, peak detection results
pd<-peaksDataset(cdfFiles[1:2],mz=seq(50,550),rtrange=c(7.5,8.5))
pd<-addAMDISPeaks(pd,eluFiles[1:2])

cac<-clusterAlignment(pd, gap = .5,D=.05,df=30)
pac<-progressiveAlignment(pd, cac, gap = .6, D=.1,df=30)
```

---

**Description**

Build a fat data matrix

**Usage**

```r
retFatMatrix(data)
```

**Arguments**

- `data` the list obtained from gatherInfo()

**Details**

This function allows to extract the data from an object created using gatherInfo and build a data matrix using the area of the deconvoluted and aligned peaks. The row are the samples while the column represent the different peaks.

**Value**

A fat data matrix containing the area of the deconvoluted and aligned peaks. The row are the samples while the column represent the different peaks.
rmaFitUnit

Fits a robust linear model (RLM) for one metabolite

Description

Using rlm from MASS, this procedure fits a linear model using all the fragments

Usage

rmaFitUnit(u,maxit=5,mzEffect=TRUE,cls=NULL,fitSample=TRUE,fitOrCoef=c("coef","fit"),TRANSFORM=log2)

Arguments

u a metabolite unit (list object with vectors mz and rt for m/z and retention times, respectively and a data element giving the fragmentxsample intensitity matrix)
maxit maximum number of iterations (default: 5)
mzEffect logical, whether to fit m/z effect (default: TRUE)
cls class variable
fitSample whether to fit individual samples (alternative is fit by group)
fitOrCoef whether to return a vector of coefficients (default: "coef"), or an rlm object ("fit")
TRANSFORM function to transform the raw data to before fitting (default: log2)

Details

Fits a robust linear model.
Value

list giving elements of fragment and sample coefficients (if `fitOrCoef="coef"`) or a list of elements from the fitting process (if `fitOrCoef="fit"`)
