Package ‘flowMerge’

April 25, 2017

Type Package
Title Cluster Merging for Flow Cytometry Data
Version 2.24.0
Date 2011-05-26
Author Greg Finak <gfinak@fhcrc.org>, Raphael Gottardo <rgottard@fhcrc.org>
Maintainer Greg Finak <gfinak@fhcrc.org>
Description Merging of mixture components for model-based automated gating of flow cytometry data using the flowClust framework.
Note: users should have a working copy of flowClust 2.0 installed.
License Artistic-2.0
LazyLoad yes
Depends graph,feature,flowClust,Rgraphviz,foreach,snow
Enhances doMC, multicore
Imports rrcov,flowCore, graphics, methods, stats, utils

flowMerge-package

Merging of mixture components for automated gating of flow cytometry data.

Description

Merges mixture components from the flowClust framework based on the entropy of clustering and provides a simple representation of complicated, non-convex cell populations.

Details

High density, non-convex cell populations in flow cytometry data often require multiple mixture components for a good model fit. The components are often overlapping, resulting in a complicated representation of individual cell populations. flowMerge merges overlapping mixture components (based on the max BIC flowClust model fit) in an iterative manner based on an entropy criterion, allowing these cell populations to be represented by individual mixture components while retaining the good model fitting properties of the BIC solution. Estimates of the number of clusters from a flowMerge model more accurately represent the "true" number of cell populations in the data. Running flowMerge is relatively straightforward. A flowClust object is converted to a flowObj object, which groups the model and the data (a flowFrame) into a single object. This is done by a call to flowObj(model, data) with a call to merge, which takes a flowObj object. The algorithm may be run in parallel on a multi-core machine or a networked cluster of machines. It uses the functionality in the snow package to achieve this. Parallelized calls to flowClust are available via the pFlowClust and pFlowMerge functions.

flowMerge has functionality to automatically select the "correct" number of clusters by fitting a piecewise linear model to the entropy of clustering vs number of clusters, and locating the position...
of the changepoint. The piecewise linear model fitting is invoked by a call to fitPiecewiseLinreg, which returns the location of the changepoint.

Examples

```r
#data(rituximab)
#data(RituximabFlowClustFit)
#o<-flowObj(flowClust.res[[which.max(flowMerge:::BIC(flowClust.res))]],rituximab);
#m<-merge(o);
#i<-fitPiecewiseLinreg(m);
#m<-m[[i]];
#plot(m,pch=20,level=0.9);
```

checkForRemoteErrors  

---

Check output of snow clusters for errors

Description
Overrides the snow checkForRemoteErrors function. Try errors are returned when cluster nodes produce errors, rather than completely aborting the computation. Not meant to be called by the user.

Usage

checkForRemoteErrors(val)

Arguments

val  The result returned from an individual cluster node.

Details
This function is meant to be called internally, but must be exported so that it can hide the native checkForRemoteErrors function in the snow package.

Value
The result from the snow cluster node, or an object of type try-error if there was an error.

**fitPiecewiseLinreg**

*Fit Piecewise Linear Regression for a list of flowMerge Objects*

**Description**

Fits a two–component piecewise linear regression to the entropy vs number of clusters for a list of merged cluster solutions.

**Usage**

```r
fitPiecewiseLinreg(x, plot=FALSE, normalized=TRUE, ...)
```

**Arguments**

- `x` A "list" of `flowMerge` objects for 1 through K clusters derived from a single max BIC `flowObj` or `flowClust` object.
- `plot` A logical indicating whether to plot the fit or not. Default is FALSE.
- `normalized` A logical indicating whether the merging should be done using the normalized or unnormalized entropy
- `...` Additional arguments not currently used.

**Details**

An S4 method that takes a list of `flowMerge` objects output by the `merge` method, extracts the entropy and fits a piecewise linear regression to the entropy vs number of clusters in order to find the postion of the changepoint. The location of the changepoint corresponds to the optimal merged cluster solution. The piecewise linear regression now is fitted to the entropy vs cumulative sum of merged observations at each number of clusters. This normalizes the change in entropy for the number of data points as described in Baudry et al.

**Value**

An integer value corresponding to the position of the changepoint.

merge

Examples

#data(rituximab)
#data(RituximabFlowClustFit)
o<-flowObj(flowClust.res[[which.max(BIC(flowClust.res))]],rituximab);
#m<-merge(o)
i<-fitPiecewiseLinreg(m);

flagOutliers

Update the flagOutliers slot in a flowMerge object

Description

Update the flagOutliers slot in a flowMerge object. This method is internal and called automatically from within the merging code.

Usage

flagOutliers(object,...)

Arguments

  object          An object of type flowMerge
   ...           Additional arguments, currently unused.
Methods to update the flagOutliers slot in a flowMerge object.

Description

Methods that update the flagOutliers slot in a flowMerge object so that they reflect the outliers in the new merged clustering. This is an internal function, not meant for user consumption. It is called from within the merge method.

Methods

object = "flowMerge" Update the flagOutliers slot for an object of type flowMerge

flowClust.res A flowClust model fitted to the rituximab data for 1:10 clusters.

Description

The Rituximab data set accessible via data(rituximab) in the flowClust package fitted to a flowClust model containing from one to ten components. The results are in the object flowClust.res.

Usage

data(RituximabFlowClustFit)

Format

The format is: flowClust.res is a flowClustList, where each element of the list is a flowClust model of the rituximab data, for K=1 through K=10 components, respectively. The structure of flowClustList and flowClust can be found in the corresponding documentation of the flowClust package. The format of the rituximab data is found in the documentation for that data set.

Details

The models have been precomputed for use in flowMerge examples to save computation time. flowClust was called on the rituximab data to generate these models with the following command:

flowClust.res<-flowClust(rituximab,K=1:10,B=1000,B.init=100,tol=1e-5,tol.init=1e-2,nu=4,randomStart=50,trans=1,nu.est=1)

Source

Examples

#data(RituximabFlowClustFit)
#summary(flowClust.res);
class "flowMerge"  

Description  
A class to represent flowMerge objects

Objects from the Class  
The object unites the flowMerge model output and the data being modeled and contains additional slots for various characteristics of a merged cluster solution, including the entropy of clustering.

Slots
merged: The number of observations merged at the current step in the algorithm.
mtree: A tree-structured graph representing the order of merged components in the model. Inspired by SPADE. (Bendall et al.)
entropy: The entropy of clustering of the current solution.
DATA: An environment whose first element contains the flowFrame with the data modeled by this flowMerge object
expName: See the flowClust package for details
varNames: See the flowClust package for details
K: The number of clusters in the merged solution. See the flowClust package for details
w: The proportions for each component in the merged solution. See the flowClust package for details
mu: The means of the components in the merged solution. See the flowClust package for details
sigma: The covariances of the components in the merged solution. See the flowClust package for details
lambda: See the flowClust package for details
nu: See the flowClust package for details
z: See the flowClust package for details
u: The uncertainties for each data point.
label: See the flowClust package for details
uncertainty: See the flowClust package for details
ruleOutliers: See the flowClust package for details
flagOutliers: See the flowClust package for details
rm.min: See the flowClust package for details
rm.max: See the flowClust package for details
logLike: See the flowClust package for details
BIC: See the flowClust package for details
ICL: See the flowClust package for details

Extends  
Class "flowObj", directly. Class "flowClust", by class "flowObj", distance 2.
Methods
- `getData` signature(obj = "flowMerge"): Retrieves the `flowFrame` in the `DATA` environment slot.
- `plot` signature(x = "flowMerge", y = "missing"): Plots the clusters in this object.
- `summary` signature(x="flowMerge"): Prints a summary of the object.
- `show` signature(x="flowMerge"): Prints information about the object.

**flowObj**

Create a `flowObj` object from a `flowClust` and `flowFrame` object

Description
Convenience method that creates a `flowObj` object from a `flowClust` and `flowFrame` object, so as to group the model and data together. Useful for high-throughput analysis where one may want to access the data to compute other statistics.

Usage
```
flowObj(flowC = NULL, flowF = NULL)
```

Arguments
- `flowC`: A `flowClust` object representing the model fit
- `flowF`: A `flowFrame` object on which the `flowClust` model is based.

Details
Calls the `new("flowObj",...` constructor.

Value
An object of class `flowObj-class`

data(RituximabFlowClustFit)
o<-flowObj(flowClust.res[[which.max(flowMerge:::BIC(flowClust.res))]],rituximab);
#m<-merge(o);

flowObj-class

Class "flowObj"

Description

A class inheriting from flowClust that groups the model and data in a single object.

Objects from the Class

Objects can be created by calls of the form new("flowObj", ...). Has a convenience method flowObj(flowClustObj, flowFrameObj) for creating instances of the class.

Slots

- **DATA**: An "environment" that holds a pointer to the flowFrame data in position [[1]].
- **expName**: As described in the flowClust documentation
- **varNames**: As described in the flowClust documentation
- **K**: As described in the flowClust documentation
- **w**: As described in the flowClust documentation
- **mu**: As described in the flowClust documentation
- **sigma**: As described in the flowClust documentation
- **lambda**: As described in the flowClust documentation
- **nu**: As described in the flowClust documentation
- **z**: As described in the flowClust documentation
- **u**: As described in the flowClust documentation
- **label**: As described in the flowClust documentation
- **uncertainty**: As described in the flowClust documentation
- **ruleOutliers**: As described in the flowClust documentation
- **flagOutliers**: As described in the flowClust documentation
- **rm.min**: As described in the flowClust documentation
initPFlowMerge

initializes a SNOW cluster for use with flowMerge

Description

Initializes a snow cluster for use with flowMerge, ensures that the flowMerge library is loaded in all environments. Not meant to be called by the user.

Usage

\[ \text{initPFlowMerge}(cl) \]

Arguments

\( cl \)

A snow cluster

Details

A valid snow cluster.
map

map

Map matrix of probabilities to class assignments.

Description
Traverse the rows of a matrix of probabilities of size n x k, where the n rows are samples, and the k columns are the probability of assignment of the sample to each of k classes. The most probable class assignment is selected for each row and a vector of classes is returned.

Usage
map(z, ...)

Arguments
z A matrix of probabilities.
... Additional arguments, not currently used.

Value
A vector of class assignments of length n.

Author(s)
Greg Finak <greg.finak@ircm.qc.ca>, Raphael Gottardo <raphael.gottardo@ircm.qc.ca>

Examples
z<-t(apply(t(replicate(100,rgamma(5,0.1,1))),1,function(x)x/sum(x)));
map(z);
Description
Merge the clusters in a flowClust solution using the cluster merging algorithm and entropy criterion.

Usage
merge(x, y, ...)

Arguments
- x: A flowObj object created from a flowClust object and a flowFrame using the flowObj constructor.
- y: missing
- ...: Additional arguments, i.e., metric = "entropy" | "mahalanobis"

Details
Run the cluster merging algorithm on the max BIC solution from a call to flowClust. The optional argument, metric specifies the measure used for clustering. Either "mahalanobis" or "entropy". Defaults to "entropy".

Value
A list of unnamed flowMerge objects. The first element of the list corresponds to the 1–cluster merged solution. The second element corresponds to the 2–cluster merged solution, and so on.

**merge-methods**

**Merge mixture components**

**Description**

Merge mixture components in a flowObj derived from a flowClust result and a flowFrame using the cluster merging algorithm.

**Value**

An unnamed list of flowMerge objects with the kth element corresponding to the k-cluster merged solution.

**Methods**

- x = "ANY", y = "ANY"  The generic method. Should not be called.
- x = "flowObj", y = "missing"  The merge method for a flowObj.

merge
Description

Extracts the normalized entropy from a list of flowMerge objects.

Usage

NENT(x)

Arguments

x  A list of flowMerge objects

Details

The normalized entropy is extracted from a flowMerge object by computing \( E / K \times n \) where \( E \) is the entropy, and \( K \) and \( n \) are the number of clusters and data points, respectively.

Value

Returns a vector of normalized entropy values for the flowMerge objects.

Warning

This function doesn’t do enough error checking and will try to extract the entropy from a list of anything.

#m<-merge(o);
#flowMerge:::ENT(m);
#flowMerge:::NENT(m);
**pFlowClust**

**Parallelized FlowClust**

**Description**
A parallelized call to flowClust via the snow package and framework. Not called by the user.

**Usage**

`pFlowClust(flowData, cl, K = 1:15, B.init = 100, tol.init = 0.01, tol = 1e-05, B = 1000, randomStart = 50, nu = 4, nu.est = 1, trans = 1, varNames = NA)`

**Arguments**

- `flowData` The data object, must be a flowFrame, flowSet or list of flowFrames
- `cl` The snow cluster object
- `K` The number of clusters to try for each flowFrame. Can be a vector. This is what is parallelized across processors.
- `B.init` See flowClust documentation
- `tol.init` See flowClust documentation
- `tol` See flowClust documentation
- `B` See flowClust documentation
- `randomStart` See flowClust documentation
- `nu` See flowClust documentation
- `nu.est` See flowClust documentation
- `trans` See flowClust documentation
- `varNames` See flowClust documentation

**Details**

Calls flowClust via the clusterMap method of the snow package. Parallelizes the computation of multiple components for a single flowFrame in a loop over multiple flowFrames. If the snow cluster is NULL, will make the call via mapply.

**Value**

Returns a list of lists of flowClust objects The outer list corresponds to the flowFrames passed into the method. The inner list corresponds to the K cluster solutions passed into the method, for each flowFrame (ie If the input is a list of two flowFrames, and K=1:10, then the result is a list of length 2. Each element of the list is itself a list of length 10. The kth element of the inner list is the flowClust k cluster solution.)

flowClust, snow

Summary

pFlowMerge

Parallel call to flowMerge

Description

Calls the flowMerge methods to compute the merged solution from a flowClust object or set of objects in a parallelized manner using the snow framework.

Usage

pFlowMerge(flowData, cl, K = 1:15, B.init = 100, tol.init = 0.01, tol = 1e-05, B = 500, randomStart = 10, nu = 4, nu.est = 0, trans = 1, varNames = NA)

Arguments

- flowData: The data to be fit. A list of flowFrames, a flowSet or a flowFrame
- cl: The snow cluster object. Can be NULL to call the non-parallel version of flowClust
- K: See flowClust documentation
- B.init: See flowClust documentation
- tol.init: See flowClust documentation
- tol: See flowClust documentation
- B: See flowClust documentation
- randomStart: See flowClust documentation
- nu: See flowClust documentation
- nu.est: See flowClust documentation
- trans: See flowClust documentation
- varNames: See flowClust documentation

Details

Makes a parallelized call to flowClust. Parses the results to extract the max BIC solution, merges clusters, finds the optimal k-cluster solution using the entropy and returns it. If cl is NULL, a non-parallel call is made to the flowClust function.

Value

A list of flowMerge objects. One per flowFrame passed into the method.

Warning

This function does not do any special memory management. A large data set will likely cause it to run out of memory and start swapping incessantly. If you have lots of data, it’s best to feed it piecewise to pFlowClust.
Author(s)

Greg Finak <<greg.finak@ircm.qc.ca>>

Examples

data(rituximab)
#Parallelized call below:
## Not run: cl<-makeSOCKcluster(rep("finakg@localhost",7))
## Not run: result<-pFlowMerge(rituximab,cl,varNames=c("FSC.H","SSC.H"))
## Not run: plot(result)
#cl<-NULL;
#result<-pFlowMerge(rituximab,cl=NULL,varNames=c("FSC.H","SSC.H"),K=1:8);
#plot(result);

Methods

Methods for plotting flowMerge and flowObj classes

Description

Plots all possible two-dimensional projections of the parameters in a flowMerge or flowObj object and does not require specification of the flowFrame since a pointer to the data is stored in the object. Informative axis names are used, rather than the usual FL1/FL2/FS/SS channel names. This function can take most of the usual additional arguments provided to plot for the flowClust package, although some, like the axis names and the data are fixed. In order for flowMerge objects to display outliers correctly with plot (following merging), the updateU method must be called on them first.

Methods

x = "flowMerge", y = "missing" x is a flowMerge object.

x = "flowObj", y = "missing" x is a flowObj object.

See Also

flowClust

Examples

#data(rituximab)
#data(RituximabFlowClustFit)
#o<-flowObj(flowClust.res[[which.max(flowMerge:::BIC(flowClust.res))]],rituximab);
#m<-merge(o);
#i<-fitPiecewiseLinreg(m);
#m<-m[i];
#plot(m,pch=20,level=0.9);
Description

This function generates and returns a new function which can be used to plot the merging tree for a flowMerge model, with nodes highlighted based on the expression of different parameters for each cell population.

Usage

\[
\text{ptree}(x, y)
\]

Arguments

- **x**: A character string of the name of the variable holding the list of merged models returned from flowMerge.
- **y**: The index of the best fitting merged model in that list.

Details

ptree will generate a function that will plot the merging tree from a flowMerge model. Nodes will be colored by the intensity of staining of that population in a given dimension. Calling \( f <- \text{ptree}("model.name", \text{fitPiecewiseLinreg}(model.name)) \) will assign the function to \( f \). Calling \( f(3) \) will plot the merging tree with nodes highlighted according to parameter 3, presuming that there are that many parameters in the model.

Value

Returns a function.

Side Effects

A plot will be drawn on the current device.

merge.
show-methods

Describe a flowObj or flowMerge object

Description

Accessors to describe a flowObj or flowMerge object.

Methods

object = "flowMerge"  Describe a flowMerge object.
object = "flowObj"  Describe a flowObj object.

split-methods

Split data in a flowMerge object by cluster

Description

Split method defined for flowMerge objects. Pulls out the population based on cluster number.

Methods

itemx = "flowMerge", f = "missing"  Split a flowMerge object into its component clusters.

summary-methods

Summary methods for flowMerge

Description

Summary method for flowMerge objects.

Methods

object = "flowMerge"  Summarize a flowMerge object.
object = "flowObj"  Summarize a flowObj object
updateU

Description

Updates the uncertainties in a flowMerge object after merging clusters. This function is now internal and no longer exported. It is called automatically within the cluster merging method.

Usage

updateU(object)

Arguments

object An object of type flowMerge

Details

Updates the u slot of the flowMerge object following merging. The update is computation intensive, and so, is not automatically performed on each flowMerge object. Should only be done on objects used in further analysis.

Value

A flowMerge object with the u slot updated to reflect the new parameter values.
