Package ‘flowWorkspace’

January 30, 2017

**Type** Package

**Title** Infrastructure for representing and interacting with the gated cytometry

**Version** 3.20.4

**Date** 2011-06-10

**Author** Greg Finak, Mike Jiang

**Maintainer** Greg Finak <gfinak@fhcrc.org>, Mike Jiang <wjjiang2@fhcrc.org>

**Description** This package is designed to facilitate comparison of automated gating methods against manual gating done in flowJo. This package allows you to import basic flowJo workspaces into BioConductor and replicate the gating from flowJo using the flowCore functionality. Gating hierarchies, groups of samples, compensation, and transformation are performed so that the output matches the flowJo analysis.

**License** Artistic-2.0

**LazyLoad** yes

**Imports** Biobase, BiocGenerics, graph, graphics, lattice, methods, stats, stats4, utils, RBGL, XML, tools, gridExtra, Rgraphviz, data.table, dplyr, latticeExtra, Rcpp, RColorBrewer, stringr, scales, flowViz

**Depends** R (>= 2.16.0), flowCore(>= 1.39.9), ncdfFlow(>= 2.19.5)

**biocViews** FlowCytometry, DataImport, Preprocessing, DataRepresentation

**Suggests** testthat, flowWorkspaceData, RSVGTipsDevice, knitr, ggcyto

**LinkingTo** Rcpp, BH(>= 1.62.0-1)

**VignetteBuilder** knitr

**SystemRequirements** xml2, GNU make

**RoxygenNote** 5.0.1

**NeedsCompilation** yes

**flowWorkspace-package**

Import and replicate flowJo workspaces and gating schemes using flowCore.

**Description**

Import flowJo workspaces into R. Generate the flowJo gating hierarchy and gates using flowCore functionality. Transform and compensate data in accordance with flowJo settings. Plot gates, gating hierarchies, population statistics, and compare flowJo vs flowCore population summaries.

**Details**

add,GatingSet,list-method

Create a GatingSet and add/remove the flowCore gate(or population) to/from a GatingHierarchy/GatingSet.

Description

GatingSet method creates a gatingset from a flowSet with the ungated data as the root node. add method add the flowCore gate to a GatingHierarchy/GatingSet. setGate method update the gate of one population node in GatingHierarchy/GatingSet. Rm method Remove the population node from a GatingHierarchy/GatingSet. They are equivalent to the workFlow.add and Rm methods in flowCore package. recompute method does the actual gating after the gate is added, i.e. calculating the event indices according to the gate definition.

Usage

```r
## S4 method for signature 'GatingSet,list'
add(wf, action, ...)

## S4 method for signature 'GatingSetList,list'
add(wf, action, ...)

## S4 method for signature 'GatingSet,filtersList'
add(wf, action, ...)

## S4 method for signature 'GatingSet,filterList'
add(wf, action, validityCheck = TRUE, ...)

## S4 method for signature 'GatingSetList,filterList'
add(wf, action, ...)

## S4 method for signature 'GatingSetList,filtersList'
add(wf, action, ...)

## S4 method for signature 'GatingSet,filter'
add(wf, action, ...)

## S4 method for signature 'GatingSet,filters'
add(wf, action, ...)

## S4 method for signature 'GatingSetList,filter'
add(wf, action, ...)

## S4 method for signature 'GatingSetList,filters'
add(wf, action, ...)
```

References

http://www.rglab.org/
add(GatingSet, list-method)

add(wf, action, ...)

## S4 method for signature 'GatingHierarchy, filters'
add(wf, action, names = NULL, ...)

## S4 method for signature 'GatingHierarchy, quadGate'
add(wf, action, names = NULL, ...)

## S4 method for signature 'character, GatingSet, character'
Rm(symbol, envir, subSymbol, ...)

## S4 method for signature 'character, GatingSetList, character'
Rm(symbol, envir, subSymbol, ...)

## S4 method for signature 'character, GatingHierarchy, character'
Rm(symbol, envir, subSymbol, ...)

Arguments

wf A GatingHierarchy or GatingSet
action A filter or a list of filters to be added to the GatingHierarchy or GatingSet.
... some other arguments to specify how the gates are added to the gating tree.

• parent: a character scalar to specify the parent node name where the new
gate to be added to, by default it is NULL, which indicates the root node
• name: a character scalar to specify the node name of population that is
generated by the gate to be added. The default value is NULL, then the
name will be extracted from the filterId of the gate to be added
• negated: a logical scalar to specify whether the gate is negated, which
means the the population outside of the gate will be kept as the result pop-
ulation. It is FALSE by default.

validityCheck logical whether to check the consistency of tree structure across samples. de-
fault is TRUE. Can be turned off when speed is prefered to the robustness.

names a character vector of length four, which specifies the population names resulted
by adding a quadGate. The order of the names is clock-wise starting from the
top left quadrant population.
symbol A character identifies the population node in a GatingHierarchy or GatingSet
to remove
envir A GatingHierarchy or GatingSet
subSymbol Not used.

Value

GatingSet method returns a GatingSet object with just root node. add method returns a popu-
lation node ID (or four population node IDs when adding a quadGate) that uniquely identify the
population node within a GatingHierarchy.

## Not run:

data(GvHD)
#select raw flow data
fs<-GvHD[1:3]

#transform the raw data
tf <- transformList(colnames(fs[[1]])[3:6], asinh, transformationId="asinh")
fs_trans<-transform(fs,tf)

#add transformed data to a gatingset
gs <- GatingSet(fs_trans)
gs
getNodes(gs[[1]]) #only contains root node

#add one gate
rg <- rectangleGate("FSC-H"=c(200,400), "SSC-H"=c(250, 400),
filterId="rectangle")
nodeID<-add(gs, rg)#it is added to root node by default if parent is not specified
nodeID
getNodes(gs[[1]]) #the second population is named after filterId of the gate

#add a quadGate
qg <- quadGate("FL1-H"=2, "FL2-H"=4)
nodeIDs<-add(gs,qg,parent="rectangle")
nodeIDs #quadGate produces four population nodes
getNodes(gs[[1]]) #population names are named after dimensions of gate if not specified

#add a boolean Gate
bg<-booleanFilter("CD15 FITC-CD45 PE+\"\"\"\"\")
bg
nodeID2<-add(gs,bg,parent="rectangle")
nodeID2
getNodes(gs[[1]])

#do the actual gating
recompute(gs)

#plot one gate for one sample
plotGate(gs[[1]],"rectangle")
plotGate(gs[[1]],nodeIDs) #may be smoothed automatically if there are not enough events after gating

#plot gates across samples using lattice plot
plotGate(gs,nodeID)

#plot all gates for one sample
plotGate(gs[[1]])#boolean gate is skipped by default
plotGate(gs[[1]],bool=TRUE)

#plot the gating hierarchy
require(Rgraphviz)
plot(gs[[1]])

#remove one node causing the removal of all the descendants
Rm('rectangle', gs)
getNodes(gs[[1]])

## End(Not run)
asinhtGml2_trans

Inverse hyperbolic sine transformation.

Description

Used to construct inverse hyperbolic sine transform object.

Usage

asinhtGml2_trans(..., n = 6, equal.space = FALSE)

Arguments

... parameters passed to asinh_Gml2
n desired number of breaks (the actual number will be different depending on the data range)
equal.space whether breaks at equal-spaced intervals

Value

asinhtGml2 transformation object

Examples

trans.obj <- asinhtGml2_trans(equal.space = TRUE)
data <- 1:1e3
brks.func <- trans.obj["breaks"]
brks <- brks.func(data)
brks # fasinh space displayed at raw data scale

#transform it to verify it is equal-spaced at transformed scale
trans.func <- trans.obj["transform"]
brks.trans <- trans.func(brks)
brks.trans

asinh_Gml2

inverse hyperbolic sine transform function generator (GatingML 2.0 version)

Description

hyperbolic sine/inverse hyperbolic sine transform function constructor. It is simply a special form of flowJo.fasinh with length set to 1 and different default values for parameters t,m,a.

Usage

asinh_Gml2(T = 262144, M = 4.5, A = 0, inverse = FALSE)
Arguments

T numeric the maximum value of input data
M numeric the full width of the transformed display in asymptotic decades
A numeric Additional negative range to be included in the display in asymptotic decades
inverse whether to return the inverse function

Value

fasinh/fsinh transform function

Examples

```r
trans <- asinh_Gml2()
data.raw <- c(1,1e2,1e3)
data.trans <- trans(data.raw)
data.trans

inverse.trans <- asinh_Gml2(inverse = TRUE)
inverse.trans(data.trans)
```

Description

booleanFilter class inherits class expressionFilter and exists for the purpose of methods dispatching.
booleanFilter is a constructor from an expression
char2booleanFilter is a constructor from a character string

Usage

```r
booleanFilter(expr, ..., filterId = "defaultBooleanFilter")
char2booleanFilter(expr, ..., filterId = "defaultBooleanFilter")
```

Arguments

expr expression or character
... further arguments to the expression
filterId character identifier
object booleanFilter

See Also

add GatingHierarchy
checkRedundantNodes

try to determine the redundant terminal(or leaf) nodes that can be removed

Description

These leaf nodes make the gating trees to be different from one another and can be removed by the subsequent convenient call dropRedundantNodes.

Usage

checkRedundantNodes(x, path = "auto", ...)

Arguments

x GatingSet or list of groups(each group is a list of 'GatingSet'). When it is a list, it is usually the outcome from groupByTree.
path argumented passed to getNodes. The default value is "auto".
...
other arguments passed to getNodes.

Value

a list of the character vectors indicating the nodes that are considered to be redundant for each group of GatingSets.

Examples

## Not run:
gslist <- list(gs1, gs2, gs3, gs4, gs5)
gs_groups <- groupByTree(gslist)
trm <- checkRedundantNodes(gs_groups)
## End(Not run)

clone

clon a GatingSet

Description

clone a GatingSet

Usage

clone(x, ...)

Arguments

x A GatingSet
...
ncdfFile = NULL: see clone.ncdfFlowSet
Details

Note that the regular R assignment operation on a GatingSet object does not return the copy as one would normally expect because the GatingSet contains environment slots (and external pointer for GatingSet), which require deep-copying. So make sure to use this clone method in order to make a copy of existing object.

Value

A copy of a given GatingSet.

Examples

```r
## Not run:
#G is a GatingSet
G1<-clone(G)

## End(Not run)
```

compensate,GatingSet,ANY-method

*compensate the flow data associated with the GatingSet*

Description

The compensation is saved in the GatingSet and can be retrieved by getCompensationMatrices.

Usage

```r
## S4 method for signature 'GatingSet,ANY'
compensate(x, spillover)

## S4 method for signature 'GatingSetList,ANY'
compensate(x, spillover)
```

Arguments

<table>
<thead>
<tr>
<th>x</th>
<th>GatingSet or GatingSetList</th>
</tr>
</thead>
<tbody>
<tr>
<td>spillover</td>
<td>compensation object or a list of compensation objects</td>
</tr>
</tbody>
</table>

Value

A GatingSet or GatingSetList object with the underlying flow data compensated.

Examples

```r
## Not run:
cfile <- system.file("extdata","compdata","compmatrix", package="flowCore")
comp.mat <- read.table(cfile, header=TRUE, skip=2, check.names = FALSE)

## create a compensation object
comp <- compensation(comp.mat,compensationId="comp1")
```
dropRedundantChannels

Remove the channels from flow data that are not used by gates

Description

Removing these redundant channels can help standardize the channels across different GatingSet objects and make them mergable.

Usage

dropRedundantChannels(gs, ...)

Arguments

gs a GatingSet
... other arguments passed to getNodes method

Value

A new GatingSet object that has redundant channels removed. Please note that this new object shares the same reference (or external pointers) with the original GatingSets.

Examples

## Not run:
gs_new <- dropRedundantChannels(gs)
## End(Not run)

---

dropRedundantNodes

Remove the terminal leaf nodes that make the gating trees to be different from one another.

Description

It is usually called after groupByTree and checkRedundantNodes. The operation is done in place through external pointers which means all the original GatingSets are modified.

Usage

dropRedundantNodes(x, toRemove)
Arguments

x  GatingSet or list of groups (each group is a list of 'GatingSet'). When it is a list, it is usually the outcome from `groupByTree`.

toRemove  list of the node sets to be removed. Its length must equal to the length of 'x'. When x is a list, toRemove is usually the outcome from `checkRedundantNodes`.

Examples

```r
## Not run:
gslist <- list(gs1, gs2, gs3, gs4, gs5)
gs_groups <- groupByTree(gslist)
toRm <- checkRedundantNodes(gs_groups)
dropRedundantNodes(gs_groups, toRm)

# Now they can be merged into a single GatingSetList.
# Note that the original gs objects are all modified in place.
GatingSetList(gslist)

## End(Not run)
```

EstimateLogicle.GatingHierarchy

Compute logicle transformation from the flowData associated with a GatingHierarchy

Description

See details in `estimateLogicle`

Usage

```r
## S3 method for class 'GatingHierarchy'
estimateLogicle(x, channels, ...)
```

Arguments

x  a GatingHierarchy

channels  channels or markers for which the logicle transformation is to be estimated.

...  other arguments

Value

transformerList object

Examples

```r
## Not run:
# gs is a GatingSet
trans.list <- estimateLogicle(gs[[1]], c("CD3", "CD4", "CD8"))
# trans.list is a transformerList that can be directly applied to GatingSet
gs <- transform(gs, trans.list)

## End(Not run)
```
**filterObject,rectangleGate-method**

*convert flowCore filter to a list*  
It convert the flowCore gate to a list  
whose structure can be understood by underlying c++ data structure.

**Description**

convert flowCore filter to a list  
It convert the flowCore gate to a list whose structure can be understood by underlying c++ data structure.

**Usage**

```r
## S4 method for signature 'rectangleGate'
filterObject(x)
```

```r
## S4 method for signature 'polygonGate'
filterObject(x)
```

```r
## S4 method for signature 'booleanFilter'
filterObject(x)
```

```r
## S4 method for signature 'ellipsoidGate'
filterObject(x)
```

**Arguments**

- `x`  
  filter a flowCore gate. Currently supported gates are: "rectangleGate", "polygonGate", "ellipsoidGate" and "booleanFilter"

**Value**

- a list

---

**flowData,GatingSet-method**

*Fetch or replace the flowData object associated with a GatingSet.*

**Description**

Accessor method that gets or replaces the flowset/ncdfFlowSet object in a GatingSet or GatingHierarchy.

**Usage**

```r
## S4 method for signature 'GatingSet'
flowData(x)
```

```r
## S4 replacement method for signature 'GatingSet'
flowData(x) <- value
```
flowJo.fasinh

Arguments

x A GatingSet

value The replacement flowSet or ncdfflowSet object

Details

Accessor method that sets or replaces the ncdfflowSet object in the GatingSet or GatingHierarchy.

Value

the object with the new flowSet in place.

Description

hyperbolic sine/inverse hyperbolic sine (flowJo-version) transform function constructor

Usage

flowJo.fasinh(m = 4, t = 12000, a = 0.7, length = 256)
flowJo.fs sinh(m = 4, t = 12000, a = 0.7, length = 256)

Arguments

m numeric the full width of the transformed display in asymptotic decades

t numeric the maximum value of input data

a numeric Additional negative range to be included in the display in asymptotic decades

length numeric the maximum value of transformed data

Value

fasinh/fsinh transform function

Examples

trans <- flowJo.fasinh()
data.raw <- c(1,1e2,1e3)
data.trans <- trans(data.raw)
data.trans

inverse.trans <- flowJo.fs inh()
in verse.trans(data.trans)
flowJoTrans

construct the flowJo-type biexponential transformation function

Description

Normally it was parsed from flowJo xml workspace. This function provides the alternate way to construct the flowJo version of logicle transformation function within R.

Usage

flowJoTrans(channelRange = 4096, maxValue = 262144, pos = 4.5, neg = 0, widthBasis = -10, inverse = FALSE)

Arguments

- channelRange: numeric, the maximum value of transformed data
- maxValue: numeric, the maximum value of input data
- pos: numeric, the full width of the transformed display in asymptotic decades
- neg: numeric, Additional negative range to be included in the display in asymptotic decades
- widthBasis: numeric, unknown.
- inverse: logical, whether to return the inverse transformation function.

Examples

trans <- flowJoTrans()
data.raw <- c(-1, 1e3, 1e5)
data.trans <- trans(data.raw)
round(data.trans)
inv <- flowJoTrans(inverse = TRUE)
round(inv(data.trans))

flowJoWorkspace-class

An R representation of a flowJo workspace.

Description

Objects can be created by calls of the form new("flowJoWorkspace.xml", ...).

Slots

- version: Object of class "character". The version of the XML workspace.
- file: Object of class "character". The file name.
- .cache: Object of class "environment". An environment for internal use.
- path: Object of class "character". The path to the file.
- doc: Object of class "XMLInternalDocument". The XML document object.
- options: Object of class "integer". The XML parsing options passed to xmlTreeParse.
See Also
  GatingSet GatingHierarchy

Examples

require(flowWorkspaceData)
d<-system.file("extdata",package="flowWorkspaceData")
wsfile<-list.files(d,pattern="A2004Analysis.xml",full=TRUE)
ws <- openWorkspace(wsfile);
ws
getSamples(ws)

flowJo_biexp_trans  flowJo biexponential transformation.

Description
  Used for constructing biexponential transformation object.

Usage

  flowJo_biexp_trans(..., n = 6, equal.space = FALSE)

Arguments

  ...                  parameters passed to flowJoTrans
  n                    desired number of breaks (the actual number will be different depending on the
data range)
  equal.space          whether breaks at equal-spaced intervals

Value

  biexponential transformation object

Examples

data(GvHD)
fr <- GvHD[[1]]
data.raw <- exprs(fr)[, "FL1-H"]
trans.obj <- flowJo_biexp_trans(equal.space = TRUE)
brks.func <- trans.obj["breaks"]
brks <- brks.func(data.raw)
brks # biexp space displayed at raw data scale

#transform it to verify it is equal-spaced at transformed scale
trans.func <- trans.obj["transform"]
print(trans.func(brks))
flowJo_fasinh_trans

flowJo inverse hyperbolic sine transformation.

Description

Used to construct the inverse hyperbolic sine transform object.

Usage

flowJo_fasinh_trans(..., n = 6, equal.space = FALSE)

Arguments

... parameters passed to flowJo.fasinh

n desired number of breaks (the actual number will be different depending on the data range)

equal.space whether breaks at equal-spaced intervals

Value

fasinh transformation object

Examples

trans.obj <- flowJo_fasinh_trans(equal.space = TRUE)
data <- 1:1e3
brks.func <- trans.obj["breaks"]
brks <- brks.func(data)
brks # fasinh space displayed at raw data scale

#transform it to verify it is equal-spaced at transformed scale
trans.func <- trans.obj["transform"]
round(trans.func(brks))

flowWorkspace.par.init

workspace version is parsed from xml node ’/Workspace/version’ in flowJo workspace and matched with this list to dispatch to the one of the three workspace parsers

Description

workspace version is parsed from xml node ’/Workspace/version’ in flowJo workspace and matched with this list to dispatch to the one of the three workspace parsers

Usage

flowWorkspace.par.init()
flowWorkspace.par.set

flowWorkspace.par.set sets a set of parameters in the flowWorkspace package namespace.

Description

flowWorkspace.par.set sets a set of parameters in the flowWorkspace package namespace.

flowWorkspace.par.get gets a set of parameters in the flowWorkspace package namespace.

Usage

flowWorkspace.par.set(name, value)

flowWorkspace.par.get(name = NULL)

Arguments

name
The name of a parameter category to get or set.

value
A named list of values to set for category name or a list of such lists if name is missing.

Details

It is currently used to add/remove the support for a specific flowJo versions (parsed from xml node '/Workspace/version' in flowJo workspace)

Examples

# get the flowJo versions currently supported
old <- flowWorkspace.par.get("flowJo_versions")

# add the new version
old["win"] <- c(old["win"], "1.7")
flowWorkspace.par.set("flowJo_versions", old)

flowWorkspace.par.get("flowJo_versions")

flow_breaks

Generate the breaks that makes sense for flow data visualization

Description

It is mainly used as helper function to construct breaks function used by 'trans_new'.

Usage

flow_breaks(x, n = 6, equal.space = FALSE, trans.fun, inverse.fun)
flow_trans

Arguments

x  the raw data values
n  desired number of breaks (the actual number will be different depending on the
data range)
equal.space  whether breaks at equal-spaced intervals
trans.fun  the transform function (only needed when equal.space is TRUE)
inverse.fun  the inverse function (only needed when equal.space is TRUE)

Value

either $10^n$ intervals or equal-spaced(after transformed) intervals in raw scale.

Examples

data(GvHD)
fr <- GvHD[[1]]
data.raw <- exprs(fr)[, "FL1-H"]
flow_breaks(data.raw)

trans <- logicleTransform()
inv <- inverseLogicleTransform(trans = trans)
myBrks <- flow_breaks(data.raw, equal.space = TRUE, trans = trans, inv = inv)
round(myBrks)
#to verify it is equally spaced at transformed scale
print(trans(myBrks))

flow_trans  

helper function to generate a trans objects Used by other specific trans
creator

Description

helper function to generate a trans objects Used by other specific trans constructor

Usage

flow_trans(name, trans.fun, inverse.fun, equal.space = FALSE, n = 6)

Arguments

name  transformation name
trans.fun  the transform function (only needed when equal.space is TRUE)
inverse.fun  the inverse function (only needed when equal.space is TRUE)
equal.space  whether breaks at equal-spaced intervals
n  desired number of breaks (the actual number will be different depending on the
data range)
Class `GatingHierarchy`

**Description**

`GatingHierarchy` is a class for representing the gating hierarchy, which can be either imported from a flowJo workspace or constructed in R.

**Details**

There is a one-to-one correspondence between `GatingHierarchy` objects and FCS files in the flowJo workspace. Each sample (FCS file) is associated with its own `GatingHierarchy`. It is also more space efficient by storing gating results as logical/bit vector instead of copying the raw data.

Given a `GatingHierarchy`, one can extract the data associated with any subpopulation, extract gates, plot gates, and extract population proportions. This facilitates the comparison of manual gating methods with automated gating algorithms.

**See Also**

`GatingSet`

**Examples**

```r
require(flowWorkspaceData)
d <- system.file("extdata", package="flowWorkspaceData")
wsfile <- list.files(d, pattern="A2004Analysis.xml", full=TRUE)
ws <- openWorkspace(wsfile);
G <- try(parseWorkspace(ws, path=d, name=1));
gh <- G[[1]]
getPopStats(gh);
plotPopCV(gh)
nodes <- getNodes(gh)
thisNode <- nodes[4]
plotGate(gh, thisNode);
getGate(gh, thisNode);
getData(gh, thisNode)
```

Class `GatingSet`

**Description**

construct object from xml workspace file and a list of sampleIDs (not intended to be called by user.)

construct a gatingset with empty trees (just root node)

construct object from existing gating hierarchy(gating template) and flow data (Defunct)
Usage

## S4 method for signature 'character,character'
GatingSet(x, y, guids, includeGates = FALSE,
    sampNloc = "keyword", xmlParserOption, wsType)

## S4 method for signature 'flowSet,ANY'
GatingSet(x)

## S4 method for signature 'GatingHierarchy,character'
GatingSet(x, y, path = ".", ...)

Arguments

x character or flowSet or GatingHierarchy
y character or missing
guids character vectors to uniquely identify each sample (Sometime FCS file names alone may not be unique)
includeGates logical whether to parse the gates or just simply extract the flowJo stats
sampNloc character scalar indicating where to get sampleName(or FCS filename) within xml workspace. It is either from "keyword" or "sampleNode".
xmlParserOption integer option passed to xmlTreeParse
wsType character workspace type, can be value of "win", "macII", "vX", "macIII".
path character specifies the path to the flow data (FCS files)
... other arguments. see parseWorkspace

Examples

## Not run:
#fdata could be a flowSet or ncdfFlowSet
gs <- GatingSet(fdata)

## End(Not run)

GatingSet-class

Class "GatingSet"

Description

GatingSet holds a set of GatingHierarchy objects, representing a set of samples and the gating scheme associated with each.

[ subsets a GatingSet or GatingSetList using the familiar bracket notation
[[ extract a GatingHierarchy object from a GatingSet or GatingSetList
**GatingSet-class**

**Usage**

```r
## S4 method for signature 'GatingSet,ANY'
x[i, j, ..., drop = TRUE]

## S4 method for signature 'GatingSet,numeric'
x[[i, j, ...]]

## S4 method for signature 'GatingSetList,ANY'
x[i, j, ..., drop = TRUE]
```

**Arguments**

- `x`: GatingSet or GatingSetList
- `i`: numeric or logical or character used as sample index
- `j`: not used
- `...`: not used
- `drop`: not used

**Details**

Objects stores a collection of GatingHierarchies and represent a group in a flowJo workspace. A GatingSet can have two "states". After a call to parseWorkspace(...,execute=FALSE), the workspace is imported but the data is not. Setting `execute=TRUE` is needed in order to load, transform, compensate, and gate the associated data. Whether or not a GatingHierarchy has been applied to data is encoded in the `flag` slot. Some methods will warn the user, or may not function correctly if the GatingHierarchy has not been executed. This mechanism is in place, largely for the purpose of speed when working with larger workspaces. It allows the use to load a workspace and subset desired samples before proceeding to load the data.

**Slots**

- `FCSPath`: deprecated
- `data`: Object of class "flowSet". flow data associated with this GatingSet
- `flag`: Object of class "logical". A flag indicating whether the gates, transformations, and compensation matrices have been applied to data, or simply imported.
- `axis`: Object of class "list". stores the axis information used for plotGate.
- `pointer`: Object of class "externalptr". points to the gating hierarchy stored in C data structure.
- `guid`: Object of class "character". the unique identifier for GatingSet object.
- `transformation`: Object of class "list". a list of transformation objects used by GatingSet.
- `compensation`: Object of class "ANY". compensation objects.

GatingHierarchy, flowJoWorkspace, parseWorkspace
Examples

```r
require(flowWorkspaceData)
d<-system.file("extdata",package="flowWorkspaceData")
wsfile<-'list.files(d,pattern="A2004Analysis.xml",full=TRUE)
ws <- openWorkspace(wsfile);
G<-'try(parseWorkspace(ws,execute=TRUE,path=d,name=1));
plotPopCV(G);
```

---

**GatingSetList-class**

*Class "GatingSetList"*

**Description**

A list of GatingSet objects. This class exists for method dispatching.

use GatingSetList constructor to create a GatingSetList from a list of GatingSet

**Usage**

```r
GatingSetList(x, samples = NULL)
```

## S4 method for signature 'GatingSetList,missing'
```
rbind2(x, y = "missing", ...)
```

**Arguments**

- **x**
  - a list of GatingSet

- **samples**
  - character vector specifying the order of samples. if not specified, the samples are ordered as the underlying stored order.

- **y**
  - missing not used.

- **...**
  - other arguments passed to rbind2 method for ncdfFlowList

**Details**

Objects store a collection of GatingSets, which usually has the same gating trees and markers. Most GatingSets methods can be applied to GatingSetList.

**See Also**

GatingSet GatingHierarchy

**Examples**

```r
# Not run:
#load several GatingSets from disk
gs_list<-lapply(list.files("../gs_toMerge",full=T) ,function(this_folder){
  load_gs(this_folder)
})

#gs_list is a list
gs_groups <- merge(gs_list)
```
#returns a list of GatingSetList objects
gslist2 <- gs_groups[[2]]
#gslist2 is a GatingSetList that contains multiple GatingSets and they share the same gating and data structure
class(gslist2)
sampleNames(gslist2)

#reference a GatingSet by numeric index
gslist2[[1]]
#reference a GatingSet by character index

gs_merged2
getCompensationMatrices,GatingHierarchy-method

Retrieves the compensation matrices from a GatingHierarchy.

Description

Retrieve the compensation matrices from a GatingHierarchy.

Usage

## S4 method for signature 'GatingHierarchy'
getCompensationMatrices(x)

Arguments

x A GatingHierarchy object.

Details

Return all the compensation matrices in a GatingHierarchy.

Value

A list of matrix representing the spillover matrix in GatingHierarchy

Examples

## Not run:
# Assume gh is a GatingHierarchy
getCompensationMatrices(gh);

## End(Not run)
### Description

get gated flow data from a GatingHierarchy/GatingSet/GatingSetList

### Usage

## S4 method for signature 'GatingHierarchy,missing'
getData(obj, y, ...)

## S4 method for signature 'GatingHierarchy,character'
getData(obj, y, ...)

## S4 method for signature 'GatingSet,missing'
getData(obj, y, ...)

## S4 method for signature 'GatingSet,character'
getData(obj, y, ...)

## S4 method for signature 'GatingSetList,ANY'
getData(obj, y, ...)

### Arguments

- **obj**: A GatingHierarchy, GatingSet or GatingSetList object.
- **y**: character the node name or full/(partial) gating path. If not specified, will return the complete flowFrame/flowSet at the root node.
- **...**: arguments passed to ncdfFlow::[[

### Details

Returns a flowFrame/flowSet containing the events in the gate defined at node y. Subset membership can be obtained using getIndices. Population statistics can be obtained using getPop and getPopStats. When calling getData on a GatingSet, the trees representing the GatingHierarchy for each sample in the GatingSet are presumed to have the same structure. To update the data, use flowData method.

### Value

A flowFrame object if obj is a GatingHierarchy. A flowSet or ncdfFlowSet if a GatingSet. A ncdfFlowList if a GatingSetList.

### See Also

flowData getIndices getPopStats
getFJWSubsetIndices

Examples

```
## Not run:
#G is a GatingSet
gpData(G,3) #get a flowSet constructed from the third node / population in the tree.
gpData(G,"cd4")

#gh is a GatingHierarchy
data(gh)

## End(Not run)
```

getFJWSubsetIndices  Fetch the indices for a subset of samples in a flowJo workspace, based on a keyword value pair

Description

This function will calculate the indices of a subset of samples in a flowJoWorkspace, based on a keyword/value filter. It is applied to a specific group of samples in the workspace. The output is meant to be passed to the subset= argument of parseWorkspace.

Usage

```
getFJWSubsetIndices(ws, key = NULL, value = NULL, group,
requiregates = TRUE)
```

Arguments

- `ws` flowJoWorkspace object
- `key` character The name of the keyword.
- `value` character The value of the keyword.
- `group` numeric The group of samples to subset.
- `requiregates` TRUE or FALSE, specifying whether we include only samples that have gates attached or whether we include any sample in the workspace.

Details

Returns an index vector into the samples in a flowJo workspace for use with parseWorkspace(subset=), based on a keyword/value filter in a specific group of samples.

Value

A numeric vector of indices.

See Also

parseWorkspace
getGate,GatingHierarchy,character-method

Return the flowCore gate definition associated with a node in a GatingHierarchy/GatingSet.

Description

Return the flowCore gate definition object associated with a node in a GatingHierarchy or GatingSet object.

Usage

## S4 method for signature 'GatingHierarchy,character'
getGate(obj, y)

## S4 method for signature 'GatingSet,character'
getGate(obj, y)

## S4 method for signature 'GatingSetList,character'
getGate(obj, y)

Arguments

obj A GatingHierarchy or GatingSet
y A character the name or full/(partial) gating path of the node of interest.

Value

A gate object from flowCore. Usually a polygonGate, but may be a rectangleGate. Boolean gates are represented by a "BooleanGate" S3 class. This is a list boolean gate definition that references populations in the GatingHierarchy and how they are to be combined logically. If obj is a GatingSet, assuming the trees associated with each GatingHierarchy are identical, then this method will return a list of gates, one for each sample in the GatingSet corresponding to the same population indexed by y.

See Also

gData getNode

Examples

## Not run: #gh is a GatingHierarchy
getGate(gh, "CD3") #return the gate for the fifth node in the tree, but fetch it by name.

#G is a GatingSet
gate(G, "CD3") #return a list of gates for the fifth node in each tree

## End(Not run)
getIndiceMat

Return the single-cell matrix of 1/0 dichotomized expression

Description

Return the single-cell matrix of 1/0 dichotomized expression

Usage

getIndiceMat(gh, y)

Arguments

- gh: GatingHierarchy object
- y: character node name

getIndices,GatingHierarchy,character-method

Get the membership indices for each event with respect to a particular gate in a GatingHierarchy

Description

Returns a logical vector that describes whether each event in a sample is included or excluded by this gate.

Usage

## S4 method for signature 'GatingHierarchy,character'
getIndices(obj, y)

Arguments

- obj: A GatingHierarchy representing a sample.
- y: A character giving the name or full/(partial) gating path of the population / node of interest.

Details

Returns a logical vector that describes whether each event in the data file is included in the given gate of this GatingHierarchy. The indices are for all events in the file, and do not reflect the population counts relative to the parent but relative to the root. To get population frequencies relative to the parent one cross-tabulate the indices of y with the indices of its parent.

Value

A logical vector of length equal to the number of events in the FCS file that determines whether each event is or is not included in the current gate.
Note

Generally you should not need to use `getIndices` but the more convenient methods `getProp` and `getPopStats` which return population frequencies relative to the parent node. The indices returned reference all events in the file and are not directly suitable for computing population statistics, unless subsets are taken with respect to the parent populations.

See Also

`getPopStats`

Examples

```r
## Not run:
#G is a gating hierarchy
#Return the indices for population 5 (topological sort)
getIndices(G,getNodes(G,tsort=TRUE)[5]);
## End(Not run)
```

---

getIndices,GatingSet,name-method

*routine to return the indices by specify boolean combination of reference nodes:*

Description

It adds the boolean gates and does the gating on the fly, and return the indices associated with that bool gate, and remove the bool gate the typical use case would be extracting any-cytokine-expressed cells

Usage

```
## S4 method for signature 'GatingSet,name'
getIndices(obj, y)
```

Arguments

- `obj` GatingSet
- `y` a quoted expression.

Examples

```r
## Not run:
getIndices(gs,quote(`4+/TNFa+|4+/IL2+`))
## End(Not run)
```
getKeywords, flowJoWorkspace, character-method

Get Keywords

Description

Retrieve keywords associated with a workspace

Usage

## S4 method for signature 'flowJoWorkspace, character'
getKeywords(obj, y, ...)

## S4 method for signature 'flowJoWorkspace, numeric'
getKeywords(obj, y, ...)

Arguments

- **obj**: A `flowJoWorkspace`
- **y**: character or numeric specifying the sample name or sample ID
- **...**: other arguments `sampNloc` a character the location where the sample name is specified. See `parseWorkspace` for more details.

Details

Retrieve a list of keywords from a `flowJoWorkspace`

Value

A list of keyword - value pairs.

Examples

```r
require(flowWorkspaceData)
d <- system.file("extdata", package="flowWorkspaceData")
wsfile <- list.files(d, pattern="manual.xml", full=TRUE)
ws <- openWorkspace(wsfile);
getSamples(ws)
res <- try(getKeywords(ws,"CytoTrol_CytoTrol_1.fcs"), silent = TRUE)
print(res[[1]])
getKeywords(ws, 1)
```
getLoglevel

get/set the log level

Description

It is helpful sometime to get more detailed print out for the purpose of trouble shooting

Usage

getLoglevel()

setLoglevel(level = "none")

Arguments

level a character that represents the log level, can be value of c("none", "GatingSet", "GatingHierarchy", "Population", "gate") default is "none", which does not print any information from C parser.

Value

a character that represents the internal log level

Examples

getLoglevel()
setLoglevel("Population")
getLoglevel()

getNodes,GatingSet-method

Get the names of all nodes from a gating hierarchy.

Description

getNodes returns a character vector of names of the nodes (populations) in the GatingSet.

Usage

## S4 method for signature 'GatingSet'
getNodes(x, y = NULL, order = "regular",
   path = "full", showHidden = FALSE, ...)

getNodes,GatingSet-method

Get the names of all nodes from a gating hierarchy.

Description

getNodes returns a character vector of names of the nodes (populations) in the GatingSet.

Usage

## S4 method for signature 'GatingSet'
getNodes(x, y = NULL, order = "regular",
   path = "full", showHidden = FALSE, ...)

getNodes,GatingSet-method

Get the names of all nodes from a gating hierarchy.
Arguments

- **x**: A GatingSet. Assuming the gating hierarchy are identical within the GatingSet, the Gating tree of the first sample is used to query the node information.
- **y**: A character not used.
- **order**: order=c("regular","tsort","bfs") returns the nodes in regular, topological or breadth-first sort order. "regular" is default.
- **path**: A character or numeric scalar. When numeric, it specifies the fixed length of gating path (length 1 displays terminal name). When character, it can be either 'full' (full path, which is default) or 'auto' (display the shortest unique gating path from the bottom of gating tree).
- **showHidden**: logical whether to include the hidden nodes
- **...**: Additional arguments.

Details

Integer indices of nodes are based on regular order, so whenever need to map from character node name to integer node ID, make sure to use default order which is regular.

Value

getNodes returns a character vector of node/population names, ordered appropriately.

Description

Returns the name of the parent population or a character/numeric vector of all the children of the current population in the given GatingHierarchy

Usage

```r
## S4 method for signature 'GatingSet,character'
getParent(obj, y, ...)

## S4 method for signature 'GatingSet,character'
getChildren(obj, y, showHidden = TRUE, ...)
```

Arguments

- **obj**: A GatingHierarchy
- **y**: a character/numeric the name or full/(partial) gating path or node indices of the node / population.
- **...**: other arguments passed to getNodes methods
- **showHidden**: logical whether to include the hidden children nodes.
Value

getParent returns a character vector, the name of the parent population. getChildren returns a character or numeric vector of the node names or node indices of the child nodes of the current node. An empty vector if the node has no children.

See Also

getNodes

Examples

```r
## Not run:
# G is a gating hierarchy
# return the name of the parent of the fifth node in the hierarchy.
getParent(G, getNodes(G)[1][5])

n <- getNodes(G, tsort=T)[4];
getChildren(G, n); # Get the names of the child nodes of the 4th node in this gating hierarchy.
getChildren(G, 4); # Get the ids of the child nodes

## End (Not run)
```

getProp, GatingHierarchy, character-method

Return a table of population statistics for all populations in a GatingHierarchy/GatingSet or the population proportions or the total number of events of a node (population) in a GatingHierarchy

Description

getProp calculates the population proportion (events in the gate / events in the parent population) associated with a node in the GatingHierarchy. getPopStats is more useful than getPop. Returns a table of population statistics for all populations in a GatingHierarchy/GatingSet. Includes the flowJo counts, flowCore counts and frequencies. getTotal returns the total number of events in the gate defined in the GatingHierarchy object

Usage

```r
## S4 method for signature 'GatingHierarchy, character'
getProp(x, y, flowJo = FALSE)

## S4 method for signature 'GatingHierarchy, character'
getTotal(x, y, flowJo = FALSE)

## S4 method for signature 'GatingHierarchy'
getPopStats(x, path = "auto", ...)

## S4 method for signature 'GatingSet'
getPopStats(x, statistic = c("freq", "count"),
    flowJo = FALSE, subpopulations = NULL, format = c("long", "wide"),
    path = "auto", ...)

## S4 method for signature 'GatingSetList'
getPopStats(x, format = c("long", "wide"), ...)
```
getProp, GatingHierarchy, character-method

Arguments

x A GatingHierarchy or GatingSet
y character node name or path
flowJo logical indicating whether the statistics come from FlowJo (if parsed from xml workspace) or from flowCore.
path character see getNodes
statistic character specifies the type of population statistics to extract. (only valid when format is "wide"). Either "freq" or "count" is currently supported.
subpopulations character vector to specify a subset of populations to return. (only valid when format is "long")
format character value of c("wide", "long") specifying whether to organize the output in long or wide format

Details

getPopStats returns a table population statistics for all populations in the gating hierarchy. The output is useful for verifying that the import was successful, if the flowJo and flowCore derived counts don’t differ much (i.e. if they have a small coefficient of variation.) for a GatingSet, returns a matrix of proportions for all populations and all samples getProp returns the proportion of cells in the gate, relative to its parent. getTotal returns the total number of events included in this gate. The contents of "thisTot" variable in the "metadata" environment of the nodeData element associated with the gating tree and gate / population.

Value

getPopStats returns a data.frame with columns for the population name, flowJo derived counts, flowCore derived counts, and the population proportions (relative to their parent population). getProp returns a population frequency numeric. getTotal returns a numeric value of the total number of elements in the population.

See Also

getNodes

Examples

## Not run:
# gh is a GatingHierarchy
getPopStats(gh);
# proportion for the fifth population
getProp(gh, getNodes(gh)[5])
getTotal(gh, getNodes(gh, tsort=T)[5])

# gs is a GatingSet
getPopStats(gs)
# optionally output in long format as a data.table
getPopStats(gs, format = "long", path = "auto")
# only get stats for a subset of populations
getPopStats(gs, format = "long", subpopulations = getNodes(gs)[4:6])

## End(Not run)
**getSampleGroups,flowJoWorkspace-method**

*Get a table of sample groups from a flowJo workspace*

**Description**

Return a data frame of sample group information from a flowJo workspace

**Usage**

```r
## S4 method for signature 'flowJoWorkspace'
getSampleGroups(x)
```

**Arguments**

- `x` A `flowJoWorkspace` object.

**Details**

Returns a table of samples and groups defined in the flowJo workspace

**Value**

A data frame containing the `groupName`, `groupID`, and `sampleID` for each sample in the workspace. Each sample may be associated with multiple groups.

**See Also**

- `flowJoWorkspace-class`
- `openWorkspace`

**Examples**

```r
## Not run:
#ws is a flowJoWorkspace
getSampleGroups(ws);
## End(Not run)
```

---

**getSamples,flowJoWorkspace-method**

*Get a list of samples from a flowJo workspace*

**Description**

Return a data frame of samples contained in a flowJo workspace

**Usage**

```r
## S4 method for signature 'flowJoWorkspace'
getSamples(x, sampNloc = "keyword")
```

**Examples**

```r
## Not run:
#ws is a flowJoWorkspace
getSamples(ws);
## End(Not run)
```
Arguments

x  A flowJoWorkspace
sampNloc  character either "keyword" or "sampleNode". see parseWorkspace

Details

Returns a data.frame of samples in the flowJoWorkspace, including their sampleID, name, and compID (compensation matrix ID).

Value

A data.frame with columns sampleID, name, and compID if x is a flowJoWorkspace.

Examples

```r
## Not run:
#ws is a flowJoWorkspace
getSamples(ws);

## End(Not run)
```

Description

Returns a list of matrix containing the events that expressed in any one of the populations defined in y.

Usage

```r
## S4 method for signature 'GatingSet,character'
getSingleCellExpression(x, nodes, other.markers = NULL, swap = FALSE, threshold = TRUE, mc.cores = getOption("mc.cores", 1L), ...)

## S4 method for signature 'GatingSetList,character'
getSingleCellExpression(x, nodes, ...)
```

Arguments

x  A GatingSet or GatingSetList object.
nodes  character vector specifying different cell populations
other.markers  character vector specifying the extra markers/channels to be returned besides the ones derived from "nodes" and "map" argument. It is only valid when threshold is set to FALSE.
swap  logical indicates whether channels and markers of flow data are swapped.
getTransformations,GatingHierarchy-method

Description

Return a list of transformations or a transformation in a GatingHierarchy

Usage

```r
## S4 method for signature 'GatingHierarchy'
getTransformations(x, channel = NULL,
                   inverse = FALSE, only.function = TRUE, ...)
```

Value

A list of numeric matrices

Author(s)

Mike Jiang <wijiang2@fhcrc.org>

See Also

getIndices getPopStats

Examples

```r
## Not run:
#G is a GatingSet
gedata(G,3)
res <- getSingleCellExpression(gs[1], c("4+/TNFa+", "4+/IL2+"))
res[[1]]
# if it fails to match the given nodes to the markers, then try to provide the mapping between node and marker
res <- getSingleCellExpression(gs[1], c("4+/TNFa+", "4+/IL2+"), map = list("4+/TNFa+" = "TNFa", "4+/IL2+" = "IL2"))

## End(Not run)
```
**Arguments**

- `x`: A `GatingHierarchy` object
- `channel`: character, channel name
- `inverse`: logical, whether to return the inverse transformation function. Valid when `only.function` is TRUE
- `only.function`: logical, whether to return the function or the entire transformer object (see scales package) that contains transform and inverse and breaks function.
- `...`: other arguments, `equal.spaced` logical, passed to the breaks function to determine whether to break at $10^n$ or equally spaced intervals.

**Details**

Returns a list of the transformations or a transformation in the `flowJo` workspace. The list is of length $L$, where $L$ is the number of distinct transformations applied to samples in the `flowJoWorkspace`. Each element of $L$ is itself a list of length $M$, where $M$ is the number of parameters that were transformed for a sample or group of samples in a `flowJoWorkspace`. For example, if a sample has 10 parameters, and 5 are transformed during analysis, using two different sets of transformations, then $L$ will be of length 2, and each element of $L$ will be of length 5. The elements of $L$ represent channel- or parameter-specific transformation functions that map from raw intensity values to channel-space used by `flowJo`.

**Value**

lists of functions (or transform objects when `only.function` is FALSE), with each element of the list representing a transformation applied to a specific channel/parameter of a sample.

**Examples**

```r
## Not run:
# Assume gh is a `GatingHierarchy`
getTransformations(gh); # return a list transformation functions
getTransformations(gh, inverse = TRUE); # return a list inverse transformation functions
getTransformations(gh, channel = "FL1-H"); # only return the transformation associated with given channel
getTransformations(gh, channel = "FL1-H", only.function = FALSE) # return the entire transform object
```

```r
## End(Not run)
```

**groupByChannels**

**Description**

Sometime it is gates are defined on the different dimensions across different `GatingSets`, (e.g. ‘FSC-W’ or ‘SSC-H’ may be used for Y axis for cytokines) These difference in dimensions may not be critical since they are usually just used for visualization (instead of thresholding events) But this prevents the `gs` from merging because they may not be collected across batches Thus we have to separate them if we want to visualize the gates.

**Usage**

`groupByChannels(x)`
Arguments

x  a list of GatingSets

Examples

### Not run:
gslist <- list(gs1, gs2, gs3, gs4, gs5)
gs_groups <- groupByChannels(gslist)

### End(Not run)

---

**groupByTree**

*split GatingSets into groups based on their gating schemes* Be careful that the splitted results still points to the original data set!!

Description

It allows isomorphism in Gating tree and ignore difference in hidden nodes i.e. tree is considered to be the same as long as getNodes(gh, path = "auto", showHidden = F) returns the same set

Usage

groupByTree(x)

Arguments

x  a list of GatingSets or one GatingSet

Value

when x is a GatingSet, this function returns a list of sub-GatingSets When x is a list of GatingSets, it returns a list of list, each list itself is a list of GatingSets, which share the same gating tree.

Examples

### Not run:
gslist <- list(gs1, gs2, gs3, gs4, gs5)
gs_groups <- groupByTree(gslist)

### End(Not run)
**insertGate**

*insert a dummy gate to the GatingSet*

**Description**

It is a useful trick to make the tree structure of GatingSet same with other so that they can be combined into a 'GatingSetList' object.

**Usage**

`insertGate(gs, gate, parent, children)`

**Arguments**

- `gs` : GatingSet to work with
- `gate` : filter a dummy gate to be inserted, its 'filterId' will be used as the population name
- `parent` : character full path of parent node where the new dummy gate to be added to
- `children` : character full path of children nodes that the new dummy gate to be parent of

**Value**

a new GatingSet object with the new gate added but share the same flow data with the input 'GatingSet'

**Examples**

```r
## Not run:
# construct a dummy singlet gate
dummyGate <- rectangleGate("FSC-A" = c(-Inf, Inf), "FSC-H" = c(-Inf, Inf), filterId = "singlets")
# insert it between the 'not debris' node and 'lymph' node
gs_clone <- insertGate(gs, dummyGate, "not debris", "lymph")
## End(Not run)
```

**isNcdf**

determine the flow data associated with a Gating Hierarchy is based on 'ncdfFlowSet' or 'flowSet'

**Description**

determine the flow data associated with a Gating Hierarchy is based on 'ncdfFlowSet' or 'flowSet'

**Usage**

`isNcdf(x)`

**Arguments**

- `x` : GatingHierarchy object
Retrieve a specific keyword for a specific sample in a GatingHierarchy or or set of samples in a GatingSet or GatingSetList

Description

Retrieve a specific keyword for a specific sample in a GatingHierarchy or or set of samples in a GatingSet or GatingSetList

Usage

```r
## S4 method for signature 'GatingHierarchy,character'
keyword(object, keyword)

## S4 method for signature 'GatingHierarchy,missing'
keyword(object, keyword = "missing", ...)

## S4 method for signature 'GatingSet,missing'
keyword(object, keyword = "missing", ...)

## S4 method for signature 'GatingSet,character'
keyword(object, keyword)

## S4 method for signature 'GatingSetList,missing'
keyword(object, keyword = "missing", ...)

## S4 method for signature 'GatingSetList,character'
keyword(object, keyword)
```

Arguments

- `object` GatingHierarchy or GatingSet or GatingSetList
- `keyword` character specifying keyword name. When missing, extract all keywords.
- `...` other arguments passed to `keyword-methods`

Details

See keyword in Package 'flowCore'

See Also

- `keyword-methods`
Examples

```r
## Not run:
# get all the keywords from all samples
keyword(G)
# get all the keywords from one sample
keyword(G[[1]])
# filter the instrument setting
keyword(G[[1]], compact = TRUE)
# get single keyword from all samples
keyword(G, "FILENAME")
# get single keyword from one sample
keyword(G[[1], "FILENAME"])

## End(Not run)
```

Description

Sample names are used for names of the returned list.

Usage

```r
## S4 method for signature 'GatingSet'
lapply(X, FUN, ...)
```

Arguments

- `X`: GatingSet
- `FUN`: function to be applied to each sample in `GatingSet`
- `...`: other arguments to be passed to `FUN`

Description

Methods to get the length of a GatingSet

Usage

```r
## S4 method for signature 'GatingSet'
length(x)
```

```r
## S4 method for signature 'GatingSet'
show(object)
```
Arguments

x GatingSet
object object

logicleGml2_trans GatingML2 version of logicle transformation.

Description

The only difference from logicle_trans is it is scaled to c(0,1) range.

Usage

logicleGml2_trans(T = 262144, M = 4.5, W = 0.5, A = 0, n = 6,
equal.space = FALSE)

Arguments

T, M, W, A see logicletGml2
n desired number of breaks (the actual number will be different depending on the
  data range)
equal.space whether breaks at equal-spaced intervals

Value

a logicleGml2 transformation object

Examples

trans.obj <- logicleGml2_trans(equal.space = TRUE)
data <- 1:1e3
brks.func <- trans.obj[['breaks']]
brks <- brks.func(data)
brks # logicle space displayed at raw data scale
#transform it to verify the equal-spaced breaks at transformed scale
print(trans.obj[['transform']](brks))

logicle_trans logicle transformation.

Description

Used for construct logicle transform object.

Usage

logicle_trans(..., n = 6, equal.space = FALSE)
Arguments

... arguments passed to logicleTransform.
n  desired number of breaks (the actual number will be different depending on the data range)
equal.space  whether breaks at equal-spaced intervals

Value

a logicle transformation object

Examples

trans.obj <- logicle_trans(equal.space = TRUE)
data <- 1:1e3
brks.func <- trans.obj["breaks"]
brks <- brks.func(data)
brks  # logicle space displayed at raw data scale
# transform it to verify the equal-spaced breaks at transformed scale
print(trans.obj["transform"](brks))

Description

It simply calls the methods for the underlying flow data (flowSet/ncdfFlowSet/ncdfFlowList).

Usage

## S4 method for signature 'GatingHierarchy'
markernames(object)

## S4 replacement method for signature 'GatingHierarchy'
markernames(object) <- value

## S4 method for signature 'GatingHierarchy'
colnames(x, do.NULL = "missing", prefix = "missing")

## S4 replacement method for signature 'GatingHierarchy'
colnames(x) <- value

## S4 method for signature 'GatingSet'
markernames(object)

## S4 replacement method for signature 'GatingSet'
markernames(object) <- value

## S4 method for signature 'GatingSet'
colnames(x, do.NULL = "missing", prefix = "missing")
## S4 replacement method for signature 'GatingSet'

```r
colnames(x) <- value
```

### Arguments

- `value` named character vector for markernames<-, regular character vector for colnames<-
- `x`, `object` `GatingHierarchy/GatingSet/GatingSetList`
- `do.NULL`, `prefix` not used.

### Examples

```r
## Not run:
markers.new <- c("CD4", "CD8")
chnls <- c("<B710-A>", "<R780-A>")
names(markers.new) <- chnls
markernames(gs) <- markers.new

chnls <- colnames(gs)
chnls.new <- chnls
chnls.new[c(1,4)] <- c("fsc", "ssc")
colnames(gs) <- chnls.new

## End(Not run)
```

---

### mkformula

`make a formula from a character vector`

**Description**

Construct a valid formula to be used by `flowViz::xyplot`

**Usage**

```r
mkformula(dims, isChar = FALSE)
```

**Arguments**

- `dims` a character vector that contains y, x axis, if it is unnamed, then treated as the order of c(y,x)
- `isChar` logical flag indicating whether to return a formula or a pasted string

**Value**

When `isChar` is `TRUE`, return a character, otherwise coerce it as a formula

**Examples**

```r
all.equal(mkformula(c("SSC-A", "FSC-A")), "SSC-A ~ FSC-A") # unnamed vector
all.equal(mkformula(c(x = "SSC-A", y = "FSC-A")), "FSC-A ~ SSC-A") # named vector
```
Fetch the flowData object associated with a GatingSet.

Description

Deprecated by flowData method

openWorkspace, character-method

Open/Close a flowJo workspace

Description

Open a flowJo workspace and return a flowJoWorkspace object. Close a flowJoWorkspace, destroying the internal representation of the XML document, and freeing the associated memory.

Usage

## S4 method for signature 'character'
openWorkspace(file, options = 0, ...)

## S4 method for signature 'flowJoWorkspace'
closeWorkspace(workspace)

Arguments

- file: Full path to the XML flowJo workspace file.
- options: xml parsing options passed to xmlTreeParse
- workspace: A flowJoWorkspace

Details

Open an XML flowJo workspace file and return a flowJoWorkspace object. The workspace is represented using a XMLInternalDocument object. Close a flowJoWorkspace after finishing with it. This is necessary to explicitly clean up the C-based representation of the XML tree. (See the XML package).

Value

a flowJoWorkspace object.
Examples

```r
## Not run:
file<-'myworkspace.xml'
ws<-openWorkspace(file);
class(ws); #flowJoWorkspace
closeWorkspace(ws);
## End(Not run)
```

Description

Function to parse a flowJo Workspace, generate a GatingHierarchy or GatingSet object, and associated flowCore gates. The data are not loaded or acted upon until an explicit call to `recompute()` is made on the GatingHierarchy objects in the GatingSet.

Usage

```r
## S4 method for signature 'flowJoWorkspace'
parseWorkspace(obj, ...)
```

Arguments

- **obj** A flowJoWorkspace to be parsed.
- **...**
  - name numeric or character. The name or index of the group of samples to be imported. If NULL, the groups are printed to the screen and one can be selected interactively. Usually, multiple groups are defined in the flowJo workspace file.
  - execute TRUE|FALSE a logical specifying if the gates, transformations, and compensation should be immediately calculated after the flowJo workspace have been imported. TRUE by default.
  - isNcdf TRUE|FALSE logical specifying if you would like to use netcdf to store the data, or if you would like to keep all the flowFrames in memory. For a small data set, you can safely set this to FALSE, but for larger data, we suggest using netcdf. You will need the netcdf C library installed.
  - subset numeric vector specifying the subset of samples in a group to import. Or a character specifying the FCS filenames to be imported. Or an expression to be passed to `subset' function to filter samples by 'pData' (Note that the columns referred by the expression must also be explicitly specified in 'keywords' argument)
  - requiregates logical. Should samples that have no gates be included?
  - includeGates logical. Should gates be imported, or just the data with compensation and transformation?
• path either a character scalar or data.frame. When character, it is a path to the fcs files that are to be imported. The code will search recursively, so you can point it to a location above the files. When it is a data.frame, it is expected to contain two columns: `sampleID` and `file`, which is used as the mapping between `sampleID` and FCS file (absolute) path. When such mapping is provided, the file system searching is avoided.

• sampNloc a character scalar indicating where to get sampleName(or FCS filename) within xml workspace. It is either from `keyword` or `sampleNode`.

• compensation=NULL: a compensation or a list of compensations that allow the customized compensation matrix to be used instead of the one specified in flowJo workspace.

• options=0: a integer option passed to xmlTreeParse

• channel.ignore.case a logical flag indicates whether the colnames(channel names) matching needs to be case sensitive (e.g. compensation, gating..)

• extend_val numeric the threshold that determine wether the gates need to be extended. default is 0. It is triggered when gate coordinates are below this value.

• extend_to numeric the value that gate coordinates are extended to. Default is -4000. Usually this value will be automatically detected according to the real data range. But when the gates needs to be extended without loading the raw data (i.e. execute is set to FALSE), then this hard-coded value is used.

• leaf.bool a logical whether to compute the leaf boolean gates. Default is TRUE. It helps to speed up parsing by turning it off when the statistics of these leaf boolean gates are not important for analysis. (e.g. COMPASS package will calculate them by itself.) If needed, they can be calculated by calling recompute method at later stage.

• additional.keys character vector: The keywords (parsed from FCS header) to be combined(concatenated with "_") with FCS filename to uniquely identify samples. Default is "$TOT" (total number of cells) and more keywords can be added to make this GUID.

• keywords character vector specifying the keywords to be extracted as pData of GatingSet

• keywords.source character the place where the keywords are extracted from, can be either "XML" or "FCS"

• keyword.ignore.case a logical flag indicates whether the keywords matching needs to be case sensitive.

• ...: Additional arguments to be passed to read.ncdfFlowSet or read.flowSet.

Details

A flowJoWorkspace is generated with a call to openWorkspace(), passing the name of the xml workspace file. This returns a flowJoWorkspace, which can be parsed using the parseWorkspace() method. The function can be called non-interactively by passing the index or name of the group of samples to be imported via parseWorkspace(obj, name=x), where x is either the numeric index, or the name. The subset argument allows one to select a set of files from the chosen sample group. The routine will take the intersection of the files in the sample group, the files specified in subset and the files available on disk, and import them.
Value

a GatingSet, which is a wrapper around a list of GatingHierarchy objects, each representing a single sample in the workspace. The GatingHierarchy objects contain graphNEL trees that represent the gating hierarchy of each sample. Each node in the GatingHierarchy has associated data, including the population counts from flowJo, the parent population counts, the flowCore gates generated from the flowJo workspace gate definitions. Data are not yet loaded or acted upon at this stage. To execute the gating of each data file, a call to execute() must be made on each GatingHierarchy object in the GatingSet. This is done automatically by default, and there is no more reason to set this argument to FALSE.

getSampleGroups, GatingSet

Examples

## Not run:
# f is a xml file name of a flowJo workspace
ws <- openWorkspace(f)
# parse the second group
gs <- parseWorkspace(ws, name = 2); # assume that the fcs files are under the same folder as workspace

gs <- parseWorkspace(ws, name = 4, path = dataDir) #specify the FCS path
, subset = "CytoTrol_CytoTrol_1.fcs" # subset the parsing by FCS filename
, isNcdf = FALSE)# turn off cdf storage mode (normally you don’t want to do this for parsing large datasets)

gs <- parseWorkspace(ws, path = dataDir, name = 4
, keywords = c("PATIENT ID", "SAMPLE ID", "$TOT", "EXPERIMENT NAME") # tell the parser to extract these keywords
, keywords.source = "XML" # keywords are extracted from xml workspace (alternatively can be set to "FCS"
, additional.keys = c("PATIENT ID") # use additional keywords together with FCS filename to uniquely identify samples
, execute = F) # parse workspace without the actual gating (can save time if just want to get the info from xml)

# subset by pData (extracted from keywords)
gs <- parseWorkspace(ws, path = dataDir, name = 4
, subset = TUBE NAME %in% c("CytoTrol_1", "CytoTrol_2")
, keywords = "TUBE NAME")

# override the default compensation defined in xml with the customized compensations
gs <- parseWorkspace(ws, name = 2, compensation = comps); # comp is either a compensation object or a list of compensation objects

## End(Not run)
Accessor method that gets or replaces the pData of the flowset/ncdfFlowSet object in a GatingSet or GatingSetList

Usage

## S4 method for signature 'GatingHierarchy'
pData(object)

## S4 method for signature 'GatingSet'
pData(object)

## S4 replacement method for signature 'GatingSet,data.frame'
pData(object) <- value

## S4 replacement method for signature 'GatingSetList,data.frame'
pData(object) <- value

Arguments

object GatingSet or GatingSetList
value data.frame The replacement of pData for flowSet or ncdfFlowSet object

Value

a data.frame

---

plot, GatingSet, missing-method

plot a gating tree

Description

Plot a tree/graph representing the GatingHierarchy

Usage

## S4 method for signature 'GatingSet,missing'
plot(x, y, ...)

## S4 method for signature 'GatingSet,character'
plot(x, y, ...)

Arguments

x GatingHierarchy or GatingSet. If GatingSet, the first sample will be used to extract gating tree.
y missing or character specifies.
... other arguments:
plotGate

Plot gates and associated cell population contained in a GatingHierarchy or GatingSet

Description

When applied to a GatingHierarchy, arrange is set as TRUE, then all the gates associated with it are plotted as different panels on the same page. If arrange is FALSE, then it plots one gate at a time. By default, merge is set as TRUE, plot multiple gates on the same plot when they share common parent population and axis. When applied to a GatingSet, if lattice is TRUE, it plots one gate (multiple samples) per page, otherwise, one sample (with multiple gates) per page.

Examples

## Not run:
#gs is a GatingSet
plot(gs) # the same as plot(gs[[1]])
#plot a substree rooted from 'CD4'
plot(gs, "CD4")

# output as svg format with onclick event of each node displaying the gate(s) saved as png files within pop-up window
plot(gs[[1]], dir = "myFolder")

# customize the size of svg and png files
plot(gh, dir = "myFolder", svg.par = list(width = 7, height = 7), png.par = list(width = 200, height = 200))

# each node link to multiple gates across samples
# here is the example code showing how to embed
# the svg output within knitr quick report

#+ eval=T, results = "asis", message = F
svgFile <- plot(gs, dir = "/svg", svg.par = list(width = 7, height = 7), png.par = list(width = 400, height = 400))
cat("<embed src="svgFile, " type=image/svg+xml"/>", sep = "")

## End(Not run)
plotGate

Usage

plotGate(x, y, ...)

## S4 method for signature 'GatingHierarchy, numeric'
plotGate(x, y, ...)

## S4 method for signature 'GatingSet, missing'
plotGate(x, y, ...)

## S4 method for signature 'GatingSetList, character'
plotGate(x, y, ...)

Arguments

x GatingSet or GatingHierarchy object

y character the node name or full/(partial) gating path or numeric representing
the node index in the GatingHierarchy, or missing which will plot all gates
and one gate per page. It is useful for generating plots in a multi-page pdf.
Nodes can be accessed with getNodes.

... • bool logical specifying whether to plot boolean gates.
• arrange.main character The title of the main page of the plot. Default is
the sample name. Only valid when x is GatingHierarchy
• arrange logical indicating whether to arrange different populations/nodes
on the same page via arrangeGrob call.
• merge logical indicating whether to draw multiple gates on the same
plot if these gates share the same parent population and same x, y di-
mens/ions/parameters;
• projections list of character vectors used to customize x, y axis. By de-
default, the x, y axis are determined by the respective gate parameters.
The elements of the list are named by the population name or path (see y).
Each element is a pair of named character specifying the channel name(or marker
name) for x, y axis. Short form of channel or marker names (e.g. "APC"
or "CD3") can be used as long as they can be uniquely matched to the di-
mentions of flow data. For example, projections = list("lymph" = c(x =
"SSC-A", y = "FSC-A"), "CD3" = c(x = "CD3", y = "SSC-A"))
• par.settings list of graphical parameters passed to lattice;
• gpar list of grid parameters passed to grid.layout;
• lattice logical deprecated;
• formula formula a formula passed to xyplot function of flowViz, by de-
default it is NULL, which means the formula is generated according to the x, y
parameters associated with gate.
• cond character the conditioning variable to be passed to lattice plot.
• overlayNode names. These populations are plotted on top of the existing
gates(defined by y argument) as the overlaid dots.
• overlay.symbolA named (lattice graphic parameter) list that defines the sym-
bol color and size for each overlaid population. If not given, we automati-
cally assign the colors.
• keyLattice legend parameter for overlay symbols.
plotGate

- default.y character specifying y channel for xyplot when plotting a 1d gate. Default is "SSC-A" and session-wise setting can be stored by `flowWorkspace.par.set("plotGate", list(default.y = "FSC-A"))`.
- type character either "xyplot" or "densityplot". Default is "xyplot" and session-wise setting can be stored by `flowWorkspace.par.set("plotGate", list(type = "xyplot"))`.
- fitGate used to disable behavior of plotting the gate region in 1d densityplot. Default is FALSE and session-wise setting can be stored by `flowWorkspace.par.set("plotGate", list(fitGate = FALSE))`.
- strip logical specifies whether to show pop name in strip box, only valid when x is GatingHierarchy.
- raw.scale logical whether to show the axis in raw (untransformed) scale. Default is TRUE and can be stored as session-wise setting by `flowWorkspace.par.set("plotGate", list(raw.scale = TRUE))`.
- xlim, ylim character can be either "instrument" or "data" which determines the x, y axis scale either by instrument measurement range or the actual data range. or numeric which specifies customized range. They can be stored as session-wise setting by `flowWorkspace.par.set("plotGate", list(xlim = "instrument"))`.
- path A character or numeric scalar passed to getNodes method (used to control how the gating/node path is displayed).
- The other additional arguments to be passed to xyplot.

Value

a trellis object if arrange is FALSE.

http://www.rglab.org/

Examples

```r
## Not run:
projections <- list("cd3" = c(x = "cd3", y = "AViD"),
                   "cd4" = c(x = "cd4", y = "CD8"),
                   "cd4/IL2" = c(x = "IL2", y = "IFNg"),
                   "cd4/IFNg" = c(x = "IL2", y = "IFNg"))
plotGate(gh, c("cd3", "cd4", "cd4/IL2", "cd4/IFNg"), path = "auto", projections = projections, gpar = c(nrow = 2))

## End(Not run)
```

```r
## Not run:
#G is a GatingHierarchy
plotGate(G, getNodes(G)[5]); # plot the gate for the fifth node

## End(Not run)
```
plotPopCV, GatingHierarchy-method

Plot the coefficient of variation between flowJo and flowCore population statistics for each population in a gating hierarchy.

Description

This function plots the coefficient of variation calculated between the flowJo population statistics and the flowCore population statistics for each population in a gating hierarchy extracted from a flowJoWorkspace.

Usage

## S4 method for signature 'GatingHierarchy'
plotPopCV(x, m = 2, n = 2, path = "auto", ...)

## S4 method for signature 'GatingSet'
plotPopCV(x, scales = list(x = list(rot = 90)), path = "auto", ...)

Arguments

- **x**: A GatingHierarchy from or a GatingSet.
- **m**: numeric. The number of rows in the panel plot. Now deprecated, uses lattice.
- **n**: numeric. The number of columns in the panel plot. Now deprecated, uses lattice.
- **path**: character. see getNodes
- **scales**: list. see barchart
- **...**: Additional arguments to the barplot methods.

Details

The CVs are plotted as barplots across panels on a grid of size m by n.

Value

Nothing is returned.

See Also

getPopStats

Examples

## Not run:
#G is a GatingHierarchy
plotPopCV(G, 4, 4);

## End(Not run)
prettyAxis

Determine tick mark locations and labels for a given channel axis

**Description**

Determine tick mark locations and labels for a given channel axis

**Usage**

```r
prettyAxis(gh, channel)
```

**Arguments**

- `gh` GatingHierarchy
- `channel` character channel name

**Value**

when there is transformation function associated with the given channel, it returns a list of that contains positions and labels to draw on the axis other wise returns NULL

**Examples**

```r
## Not run:
prettyAxis(gh, "<B710-A>")
## End(Not run)
```

recompute,GatingSet-method

*Compute the cell events by the gates stored within the gating tree*

**Description**

Compute each cell event to see if it falls into the gate stored within the gating tree and store the result as cell count.

**Usage**

```r
## S4 method for signature 'GatingSet'
recompute(x, ...)
```

```r
## S4 method for signature 'GatingSetList'
recompute(x, ...)
```
sampleNames,GatingHierarchy-method

Arguments

- `x`: GatingSet
- `...`: other arguments
- `y`: character node name or node path
- `alwaysLoadData`: logical
  - Specifies whether to load the flow raw data for gating for boolean gates, sometimes it is more efficient to skip loading the raw data if all the reference nodes and parent are already gates. Default 'FALSE' will check the parent node and reference to determine whether to load the data but this check may not be sufficient since the further upstream ancestor nodes may not be gated yet. In that case, we allow the gating to be failed and prompt user to recompute those nodes explicitly. When TRUE, then it forces data to be loaded to guarantee the gating process to be uninterrupted, yet may at the cost of unnecessary data IO.

Details

It is usually used immediately after `add` or `setGate` calls.

sampleNames,GatingHierarchy-method

*Get/update sample names in a GatingSet*

Description

Return a sample names contained in a GatingSet

Usage

```
## S4 method for signature 'GatingHierarchy'
sampleNames(object)

## S4 method for signature 'GatingSet'
sampleNames(object)

## S4 replacement method for signature 'GatingSet'
sampleNames(object) <- value
```

Arguments

- `object`: or a GatingSet
- `value`: character new sample names

Details

The sample names comes from `pdata` of `fs`.

Value

A character vector of sample names
Examples

```r
## Not run:
#G is a GatingSet
sampleNames(G)

## End(Not run)
```

### Description

Save/load a GatingSet/GatingSetList which is the gated flow data including gates and populations to/from the disk. The GatingSet object The internal C data structure (gating tree), ncdfFlowSet object (if applicable).

### Usage

```r
save_gs(G, path, overwrite = FALSE, cdf = c("copy", "move", "skip",
"symlink", "link"), ...)
load_gs(path)
save_gslst(gslist, path, ...)
load_gslst(path)
```

### Arguments

- **G** A GatingSet
- **path** A character scalar giving the path to save/load the GatingSet to/from.
- **overwrite** A logical scalar specifying whether to overwrite the existing folder.
- **cdf** A character scalar. The valid options are: "copy", "move", "skip", "symlink", "link" specifying what to do with the cdf data file. Sometime it is more efficient to move or create a link of the existing cdf file to the archived folder. It is useful to "skip" archiving cdf file if raw data has not been changed.
- **...** other arguments: not used.
- **gslist** A GatingSetList

### Value

- **load_gs** returns a GatingSet object
- **load_gslst** returns a GatingSetList object

### See Also

[GatingSet-class], [GatingSetList-class]
Examples

```r
## Not run:
#G is a GatingSet
save_gs(G,path="tempFolder")
G1<-load_gs(path="tempFolder")

#G is a GatingSet
save_gslist(gslist1,path="tempFolder")
gslist2<-load_gslist(path="tempFolder")

## End(Not run)
```

Description

update the population node with a flowCore-compatible gate object

Usage

```r
## S4 method for signature 'GatingHierarchy,character,filter'
setGate(obj, y, value,  
  negated = FALSE, ...)

## S4 method for signature 'GatingSet,character,list'
setGate(obj, y, value, ...)

## S4 method for signature 'GatingSet,character,filterList'
setGate(obj, y, value, ...)
```

Arguments

- **obj** GatingHierarchy or GatingSet
- **y** character node name or path
- **value** filter or filterList or list of filter objects
- **negated** logical see add
- **...** other arguments

Details

Usually `recompute` is followed by this call since updating a gate doesn’t re-calculating the cell events within the gate automatically. see `filterObject` for the gate types that are currently supported.
Examples

```r
## Not run:
rg1 <- rectangleGate("FSC-H"=c(200,400), "SSC-H"=c(250, 400), filterId="rectangle")
rg2 <- rectangleGate("FSC-H"=c(200,400), "SSC-H"=c(250, 400), filterId="rectangle")
flist <- list(rg1, rg2)
names(flist) <- sampleNames(gs[1:2])
setGate(gs[1:2], "lymph", flist)
recompute(gs[1:2], "lymph")

## End(Not run)
```

### Description

setNode update the name of one node in a gating hierarchy/GatingSet.

#### Usage

**setNode(x, y, value)**

- **x** GatingHierarchy object
- **y** character node name or path
- **value** A character the name of the node. or logical to indicate whether to hide a node

#### Examples

```r
## Not run:
#G is a gating hierarchy
gn <- getNodes(G[[1]])#return node names
setNode(G,"L","lymph")

## End(Not run)
## Not run:
setNode(gh, 4, FALSE) # hide a node
setNode(gh, 4, TRUE) # unhide a node

## End(Not run)
```
standardize-GatingSet  The tools to standardize the tree structures and channel names.

Description

- `groupByTree(x)`: Splits the GatingSets into groups based on the gating tree structures.
- `groupByChannels(x)`: Splits GatingSets into groups based on their flow channels.
- `checkRedundantNodes(x)`: Returns the terminal (or leaf) nodes that make the gating trees to be different among GatingSets and thus can be considered to remove as redundant nodes.
- `dropRedundantNodes(x, toRemove)`: Removes the terminal (or leaf) nodes that are detected as redundant by `checkRedundantNodes`.
- `dropRedundantChannels(gs)`: Removes the redundant channels that are not used by any gate defined in the GatingSet.
- `updateChannels(gs, map, all = TRUE)`: Modifies the channel names in place. (Usually used to standardize the channels among GatingSets due to the letter case discrepancies or typo).
- `insertGate(gs, gate, parent, children)`: Inserts a dummy gate to the GatingSet. Is useful to deal with the extra non-leaf node in some GatingSets that can not be simply removed by `dropRedundantNodes`.
- `setNode(x, y, FALSE)`: Hides a node/gate in a GatingSet. It is useful to deal with the non-leaf node that causes the tree structure discrepancy.

Details

In order to merge multiple GatingSets into single `GatingSetList`, the gating trees and channel names must be consistent. These functions help removing the discrepancies and standardize the GatingSets so that they are mergable.

- `groupByTree` splits the GatingSets into groups based on the gating tree structures.
- `groupByChannels` splits GatingSets into groups based on their flow channels.
- `checkRedundantNodes` returns the terminal (or leaf) nodes that make the gating trees to be different among GatingSets and thus can be considered to remove as redundant nodes.
- `dropRedundantNodes` removes the terminal (or leaf) nodes that are detected as redundant by `checkRedundantNodes`.
- `dropRedundantChannels` removes the redundant channels that are not used by any gate defined in the GatingSet.
- `updateChannels` modifies the channel names in place. (Usually used to standardize the channels among GatingSets due to the letter case discrepancies or typo).
- `insertGate` inserts a dummy gate to the GatingSet. Is useful to deal with the extra non-leaf node in some GatingSets that can not be simply removed by `dropRedundantNodes`.
- `setNode` hides a node/gate in a GatingSet. It is useful to deal with the non-leaf node that causes the tree structure discrepancy.

subset.GatingSet  subset the GatingSet/GatingSetList based on ’pData’

Description

subset the GatingSet/GatingSetList based on ’pData’

Usage

subset.GatingSet(x, subset, ...)
transform,GatingSet-method

Arguments

x GatingSet or GatingSetList
subset logical expression(within the context of pData) indicating samples to keep. see 
subset
... other arguments. (not used)

Value

a codeGatingSet or GatingSetList object

transform,GatingSet-method

transform the flow data asssociated with the GatingSet

Description

The transformation functions are saved in the GatingSet and can be retrieved by getTransformations. Currently only flowJo-type biexponential transformation(either returned by getTransformations or constructed by flowJoTrans) is supported.

Usage

## S4 method for signature 'GatingSet'
transform(`_data`, ...)

## S4 method for signature 'GatingSetList'
transform(`_data`, ...)

Arguments

_data GatingSet or GatingSetList
... expect a transformList object

Value

a GatingSet or GatingSetList object with the underling flow data transformed.

Examples

## Not run:
data(GvHD)
fs <- GvHD[1:2]
gs <- GatingSet(fs)

#construct biexponential transformation function
biexpTrans <- flowJo_biexp_trans(channelRange=4096, maxValue=262144, pos=4.5, neg=0, widthBasis=-10)

#make a transformList object
chnls <- c("FL1-H", "FL2-H")
transList <- transformerList(chnls, biexpTrans)
transformerList

Constructor for transformerList object

Description

Similar to transformList function, it constructs a list of transformer objects generated by trans_new method from scales so that the inverse and breaks functions are also included.

Usage

transformerList(from, trans)

Arguments

from channel names
trans a trans object or a lost of trans objects constructed by trans_new method.

Examples

library(scales)
# create transformer object from scratch
trans <- logicleTransform(w = 0.5, t = 262144, m = 4.5, a = 0)
inv <- inverseLogicleTransform(trans = trans)
trans.obj <- flow_trans("logicle", trans, inv, n = 5, equal.space = FALSE)

# or simply use convenient constructor
# trans.obj <- logicle_trans(n = 5, equal.space = FALSE, w = 0.5, t = 262144, m = 4.5, a = 0)

transformerList(c("FL1-H", "FL2-H"), trans.obj)

# use different transformer for each channel
trans.obj2 <- asinhGml2_trans()
transformerList(c("FL1-H", "FL2-H"), list(trans.obj, trans.obj2))

updateChannels

Update the channel information of a GatingSet (c++ part)

Description

It updates the channels stored in gates, compensations and transformations based on given mapping between the old and new channel names.

Usage

updateChannels(gs, map, all = TRUE)
updateChannels

Arguments

- **gs** a GatingSet object
- **map** data.frame contains the mapping from old (case insensitive) to new channel names Note: Make sure to remove the '<' or '>' characters from 'old' name because the API tries to only look at the raw channel name so that the gates with both prefixed and non-prefixed names could be updated.
- **all** logical whether to update the flow data as well

Value

when `all` is set to TRUE, it returns a new GatingSet but it still shares the same underlying C++ tree structure with the original GatingSet otherwise it returns nothing (less overhead.)

Examples

```r
## Not run:
##this will update both "Qdot 655-A" and "<Qdot 655-A>"
gs <- updateChannels(gs, map = data.frame(old = c("Qdot 655-A"),
                                            new = c("QDot 655-A"))
)

## End(Not run)
```
