Package ‘goTools’

January 14, 2017

Version 1.48.0
Date 2009-10-23
Title Functions for Gene Ontology database
Depends GO.db
Imports AnnotationDbi, GO.db, graphics, grDevices
Suggests hgu133a.db
biocViews Microarray,GO,Visualization
Author Yee Hwa (Jean) Yang <jean@biostat.ucsf.edu>, Agnes Paquet <paquetagnes@yahoo.com>
Maintainer Agnes Paquet <paquetagnes@yahoo.com>
Description Wraper functions for description/comparison of oligo ID list using Gene Ontology database
License GPL-2
LazyLoad yes
NeedsCompilation no

R topics documented:

EndNodeList .................................................. 1
goTools .......................................................... 2
Internal functions .......................................... 4
probeID ......................................................... 4

Index

EndNodeList Reference GO nodes list.

Description

The function EndNodeList builds the default end node list used in ontoCompare. CustomEndNodeList helps you build a list of children nodes starting from a GO id of interest.
Usage
EndNodeList()
CustomEndNodeList(id, rank=1)

Arguments
id Valid GO id: "GO:XXXXXXXX".
rank Number of levels of children of the GO DAG under id you want to add to your nodes list.

Value
EndNodeList returns a vector of all GO ids 1 level below MF("GO:0003674"), BP("GO:0008150") and CC("GO:0005575"). MF, BP and CC nodes are included. CustomEndNodeList returns a vector of all GO ids children of id, rank levels below it.

Author(s)
Yee Hwa (Jean) Yang, Agnes Paquet

ontoCompare

Examples
## Examples use the probeID dataset. For description type ? probeID.
## library(GO.db)
## EndNodeList()
## MFendnode <- CustomEndNodeList("GO:0003674", rank=2)
## Example (not run)
## data(probeID)
## ontoCompare(affylist, probeType="hgu133a", endnode=MFendnode, goType="MF")

---

Description
This function will allow you to describe and compare sets of oligo ids using Gene Ontology database.

Usage
ontoCompare(genelist, probeType=c("GO", "hgu133a"),
goType="All", endnode, method=c("TGenes", "TIDS", "none"), plot=FALSE, ...
ontoPlot(objM, names.arg=NULL, beside=TRUE, las=2, legend.text=TRUE, ...)
Arguments

genelist list of list of valid probe ids.
method method used to evaluate the percentage of oligos for each end-node. 'TGenes' = for each end node, return the number of direct children found / total number of probe ids. (default). This includes oligos which do not have GO annotations. 'TIDS' = for each end node, return the number of direct children found / total number of GO ids describing the list. 'none' = for each end node, return the number of direct children found.
probeType type of input given to the function. Valid probe types include GO ids and any probes ids for which a BioC annotation package providing a mapping to GO is available. ontoCompare is expecting valid probe ids.
goType help sort the data by type. If 'All' (default), all oligos are taken into account. 'BP' restricts information to Biological Process, 'CC' to Cellular Component, and 'MF' to Molecular Function.
plot logical: if 'TRUE', results are output as a graph.
endnode list of GO ids corresponding to end-nodes of interest.
beside Logical. If 'TRUE', the bars of the barplot are portrayed as juxtaposed bars. See ?barplot for more details.
las numeric: if las=2, the axis labels are displayed perpendicular to the axis. See ?par for more details.
legend.text vector of text used to construct a legend for the plot. See ?barplot for more details.
objM results from ontoCompare.
names.arg Labels to use in ontoPlot.
...
extra layout parameters to be passed to ontoPlot.

Value

Returns the percentage of probes children of nodes contained in endnode. If ‘plot’ = TRUE, results are plotted as a pie chart or a bargraph.

Author(s)

Yee Hwa (Jean) Yang, Agnes Paquet

Examples

# Examples use the probeID dataset. For description type ?probeID.
# Not run

#library(GO.db)
data(probeID)
#ontoCompare(affylist, probeType="hgu133a", plot=TRUE)
#res <- ontoCompare(operonlist["L1"], probeType="operon", method="TIDS")
#ontoPlot(res, cex=0.7)
### Description

**Internal goTools functions**

### Details

These are not to be called by the user.

| probeID                     | List of probe ids from Affymetrix hgu133a chip and Operon Version 2 Human oligos |

### Description

The `probeID` dataset consists of two lists of randomly chosen probe Ids. `affylist` contains 3 sets of ids from Affymetrix hgu133a. `operonlist` contains 2 sets of ids from Operon Version 2.

### Usage

```
data(probeID)
```
