Package ‘graphite’

April 26, 2022

Version 1.42.0
Date 2022-04-21
Title GRAPH Interaction from pathway Topological Environment
Description Graph objects from pathway topology derived from KEGG, Panther, PathBank, PharmGKB, Reactome SMPDB and WikiPathways databases.
License AGPL-3

**R topics documented:**

- as.list.PathwayList
- buildPathway
- convertIdentifiers
- cytoscapePlot
- Pathway-class
- pathwayDatabases
- pathwayGraph
- PathwayList-class
- pathways
- Pathways-class
- prepareSPIA
- runClipper
- runSPIA
- runTopologyGSA

---

**as.list.PathwayList**  
*Conversion of PathwayLists into lists.*

**Description**

Converts a `PathwayList` into a list of `Pathways`.

**Usage**

```r
## S3 method for class 'PathwayList'
as.list(x, ...)
```

**Arguments**

- `x`  
  a `PathwayList` object
- `
  `  
  extra arguments to as.list

**Value**

A list of pathways.

**Author(s)**

Gabriele Sales

**See Also**

`PathwayList`
**buildPathway**

**Examples**

```r
as.list(pathways("hsapiens", "kegg"))
```

---

**buildPathway**  
*Build a Pathway object.*

**Description**

This function creates a new object of type Pathway given a data frame describing its edges.

**Usage**

```r
buildPathway(id, title, species, database, proteinEdges, 
metaboliteEdges = NULL, mixedEdges = NULL, 
timestamp = NULL)
```

**Arguments**

- `id`  
  the pathway identifier.

- `title`  
  the title of the pathway.

- `species`  
  the species the pathway belongs to.

- `database`  
  the name of the database the pathway derives from.

- `proteinEdges`  
  a data.frame of edges between proteins (or genes).
  Must have the following columns: `src_type`, `src`, `dest_type`, `dest`, `direction` and `type`.  
  Direction must be one of the two strings: "directed" or "undirected".

- `metaboliteEdges`  
  interactions between metabolites.  
  Can be NULL. Otherwise, it must have the same structure as `proteinEdges`.

- `mixedEdges`  
  interactions between metabolites and proteins.  
  Can be NULL. Otherwise, it must have the same structure as `proteinEdges`.

- `timestamp`  
  when the pathway was annotated, by default the time `buildPathway` is called.

**Value**

A new **Pathway** instance.
convertIdentifiers

Examples

```r
edges <- data.frame(src_type = "ENTREZID", src="672",
dest_type = "ENTREZID", dest="7157",
direction="undirected", type="binding")
pathway <- buildPathway("#1", "example", "hsapiens", "database", edges)

# Example with metabolites:
edges <- data.frame(src_type = "ENTREZID", src="672",
dest_type = "ENTREZID", dest="7157",
direction="undirected", type="binding")
mixed <- data.frame(src_type = "CHEBI", src="77750",
dest_type = "ENTREZID", dest="7157",
direction="undirected", type="binding")
pathway <- buildPathway("#1", "example", "hsapiens", "database",
                        edges, mixedEdges = mixed)
```

convertIdentifiers  Convert the node identifiers of a pathway.

Description

Converts the node identifiers of pathways.

If the option Ncpus is set to a value larger than 1 and the package parallel is installed, the conversion procedure will automatically use multiple cores.

Usage

```r
convertIdentifiers(x, to)
```

Arguments

- `x` can be a list of pathways or a single pathway
- `to` a string describing the type of the identifier. Can assume the values "entrez", "symbol" or the name of one of the columns provided by an Annotation package (for example, "UNIPROT").

Value

A Pathway object.

See Also

- `Pathway`

Examples

```r
r <- pathways("hsapiens", "reactome")
convertIdentifiers(r$"mTORC1-mediated signalling", "symbol")
```
cytoscapePlot

Plot a pathway graph in Cytoscape

Description

Renders the topology of a pathway as a Cytoscape graph.

Usage

cytoscapePlot(pathway, ..., cy.ver = 3)

Arguments

pathway a Pathway object.
...
optional arguments forwarded to pathwayGraph.
cy.ver select a Cytoscape version. Only version 3 is supported in this release.

Details

Requires the RCy3 package.

Value

An invisible list with two items:

graph the graphNEL object sent to Cytoscape.
suid the RCy3 network SUID.

See Also

Pathway
pathwayGraph

Examples

## Not run:
r <- pathways()
cytoscapePlot(convertIdentifiers(reactome$'Unwinding of DNA', "symbol"))

## End(Not run)
Pathway-class

Class "Pathway"

Description
A biological pathway.

Variants
A Pathway instance actually stores multiple variants of the same biological data.

This is the list of included variants:

- proteins: includes only interactions among proteins;
- metabolites: includes only interactions among metabolites;
- mixed: includes all available interactions.

Methods

pathwayId(p): Returns the native ID of the pathway.
pathwayTitle(p): Returns the title of the pathway.
pathwayDatabase(p): Returns the name of the database the pathway was derived from.
pathwaySpecies(p): Returns the name of the species in which the pathway was annotated.
pathwayTimestamp(p): Returns the date of pathway data retrieval.
pathwayURL(p): Returns the URL of the pathway in its original database, if available.
convertIdentifiers(p, to): Returns a new pathway using a different type of node identifiers.
edges(p, which = c("proteins", "metabolites", "mixed"), stringsAsFactors = TRUE): Returns a data.frame describing the edges of this pathway.

The option which selects the desired pathway variant (see section "Variants" above).

If stringsAsFactors is TRUE, strings are converted to factors.
nodes(p, which = c("proteins", "metabolites", "mixed")): Returns the names of the nodes belonging to this pathway.

The option which selects the desired pathway variant (see section "Variants" above).
plot(p): Shows the pathway topology in Cytoscape.
runClipper(p, expr, classes, method, ...): Runs a clipper analysis over the pathway.
runTopologyGSA(p, test, exp1, exp2, alpha, ...): Runs a topologyGSA analysis over the pathway.

pathways
Examples

```r
reactome <- pathways("hsapiens", "reactome")
pathway <- reactome[[1]]

pathwayTitle(pathway)
pathwaySpecies(pathway)
nodes(pathway)
edges(pathway)
```

---

**pathwayDatabases**  
*List the available pathway databases.*

Description

Obtains the list of pathway databases available through graphite.

Usage

```r
pathwayDatabases()
```

Value

Returns a data.frame with two columns: species and database.

Author(s)

Gabriele Sales

See Also

`pathways`

Examples

```r
pathwayDatabases()
```
pathwayGraph  

A collection of pathways from a single database.

Detailed description of the pathwayGraph function:

### Description

Builds a graphNEL object representing the topology of a pathway.

### Usage

```r
pathwayGraph(pathway, which = "proteins", edge.types = NULL)
```

### Arguments

- `pathway`: a `Pathway` object.
- `which`: the pathway variant you want.
  
  See `Pathway` documentation for a list of the supported variants.

- `edge.types`: keep only the edges matching the type names in this vector.

### Value

A graphNEL object.

### See Also

- `Pathway`
- `graphNEL`

### Examples

```r
r <- pathways("hsapiens", "reactome")
pathwayGraph(r$mTORC1-mediated signalling", edge.types="Binding")
```
Methods

1[i]: Returns a selection of the pathways contained in the pathway list.
1[[i]]: Access one of the pathways contained in the pathway list.
1$`title': Access one of the pathways by its title.
convertIdentifiers(l, to) Returns a new list of pathways using a different type of node identifiers.
length(l) Returns the number of pathways contained in the list.
names(l) Returns the titles of the pathways contained in the list.
prepareSPIA(l, pathwaySetName, print.names=FALSE) Prepares the pathways for a SPIA analysis.
runClipper(l, expr, classes, method, maxNodes=150, ...) Runs a clipper analysis over all the pathways in the list.
runTopologyGSA(l, test, exp1, exp2, alpha, maxNodes=150, ...) Runs a topologyGSA analysis over all the pathways in the list.

pathways

Description

Retrieve a list of pathways from a database for a given species.

graphite currently supports the following databases:

- KEGG
- PANTHER
- PathBank
- PharmGKB
- Reactome
- SMPDB
- WikiPathways

Call the pathwayDatabase function for more details.

Usage

pathways(species, database)
**Class** "Pathways"

Pathways-class

**Description**

A virtual class acting as a common parent to all other classes representing pathway databases.

**Objects from the Class**

A virtual Class: No objects may be created from it.

**Methods**

No methods defined with class "Pathways" in the signature.

**Author(s)**

Gabriele Sales

**See Also**

PathwayList, pathwayDatabases
prepareSPIA

Description

Prepare pathway dataset needed by runSPIA. See runSPIA and spia for more details.

Usage

prepareSPIA(db, pathwaySetName, print.names = FALSE)

Arguments

db a PathwayList object or a list of Pathways.
pathwaySetName name of the output pathway set.
print.names print pathway names as the conversion advances.

Value

This function has no return value.

References

See Also

runSPIA
spia
PathwayList
runClipper

Run a topological analysis on an expression dataset using clipper.

Description

clipper is a package for topological gene set analysis. It implements a two-step empirical approach based on the exploitation of graph decomposition into a junction tree to reconstruct the most relevant signal path. In the first step clipper selects significant pathways according to statistical tests on the means and the concentration matrices of the graphs derived from pathway topologies. Then, it "clips" the whole pathway identifying the signal paths having the greatest association with a specific phenotype.

If the option Ncpus is set to a value larger than 1 and the package parallel is installed, the conversion procedure will automatically use multiple cores.

Usage

runClipper(x, expr, classes, method, which = "proteins", seed = NULL, ...)

Arguments

- **x**: a PathwayList, a list of Pathways or a single Pathway object.
- **expr**: a matrix (size: number p of genes x number n of samples) of gene expression.
- **classes**: a vector (length: n) of class assignments.
- **method**: the kind of test to perform on the cliques. It could be either "mean" or "variance".
- **which**: the pathway variant you want. See Pathway documentation for a list of the supported variants.
- **seed**: if not NULL, set the seed for the random number generator used by clipper.
- **...**: additional options: see for details easyClip.

When invoked on a PathwayList, you can use the named option maxNodes to limit the analysis to those pathways with at most a given number of nodes.

Details

The expression data and the pathway have to be annotated in the same set of identifiers.

Value

See the documentation of easyClip.

References

runSPIA

Run SPIA analysis

Description

Run a topological analysis on an expression dataset using SPIA.

Usage

runSPIA(de, all, pathwaySetName, ...)

Arguments

de A named vector containing log2 fold-changes of the differentially expressed genes. The names of this numeric vector are Entrez gene IDs.

all A vector with the Entrez IDs in the reference set. If the data was obtained from a microarray experiment, this set will contain all genes present on the specific array used for the experiment. This vector should contain all names of the `de` argument.

pathwaySetName The name of a pathway set created with prepareSPIA.

... Additional options to pass to spia.

Details

The spia option "organism" is internally used. It is an error use it in the additional options.
runSPIA

Value

The same of spia, without KEGG links. A data frame containing the ranked pathways and various statistics: pSize is the number of genes on the pathway; NDE is the number of DE genes per pathway; tA is the observed total perturbation accumulation in the pathway; pNDE is the probability to observe at least NDE genes on the pathway using a hypergeometric model; pPERT is the probability to observe a total accumulation more extreme than tA only by chance; pG is the p-value obtained by combining pNDE and pPERT; pGFdr and pGFWER are the False Discovery Rate and respectively Bonferroni adjusted global p-values; and the Status gives the direction in which the pathway is perturbed (activated or inhibited).

spia

Examples

if (require(SPIA) & require(hgu133plus2.db)) {
  data(colorectalcancer)
  top$ENTREZ <- mapIds(hgu133plus2.db, top$ID, "ENTREZID", "PROBEID", multiVals = "first")
  top <- top[!is.na(top$ENTREZ) & !duplicated(top$ENTREZ), ]
  top$ENTREZ <- paste("ENTREZID", top$ENTREZ, sep = ":")
  tg1 <- top[top$adj.P.Val < 0.05, ]
  DE_Colorectal = tg1$logFC
  names(DE_Colorectal) <- tg1$ENTREZ
  ALL_Colorectal <- top$ENTREZ
  kegg <- pathways("hsapiens", "kegg")[1:20]
  kegg <- convertIdentifiers(kegg, "ENTREZID")
  prepareSPIA(kegg, "keggEx")
  runSPIA(de = DE_Colorectal, all = ALL_Colorectal, "keggEx")

  unlink("keggExSPIA.RData")
}
Run a topological analysis on an expression dataset using topologyGSA.

Description

Use graphical models to test the pathway components highlighting those involved in its deregulation.

If the option `Ncpus` is set to a value larger than 1 and the package `parallel` is installed, the conversion procedure will automatically use multiple cores.

Usage

```
runTopologyGSA(x, test, exp1, exp2, alpha, ...)
```

Arguments

- `x` - a `PathwayList`, a list of `Pathways` or a single `Pathway` object.
- `test` - Either "var" and "mean". Determine the type of test used by topologyGSA.
- `exp1` - Experiment matrix of the first class, genes in columns.
- `exp2` - Experiment matrix of the second class, genes in columns.
- `alpha` - Significance level of the test.
- `...` - Additional parameters forwarded to topologyGSA.

Details

This function produces a warning and returns `NULL` when the number of genes in common between the expression matrices and the pathway is less than 3.

Value

See documentation of `pathway.var.test` and `pathway.mean.test`.
