Description

A convenience constructor for \texttt{graphBPH-class} objects. This is a generic function.

Usage

\begin{verbatim}
graphBPH(graph, edgeNodePattern, ...)
\end{verbatim}
Arguments

- **graph**: Some form of graph that is to be converted into a graphBPH object.
- **edgeNodePattern**: A regular expression used to distinguish between normal nodes and edge nodes.
- ... Potential arguments to other methods.

Value

An object of class `graphBPH-class`

Methods

- `graphBPH` signature(graph = "graphNEL", edgeNodePattern = "character"): create a graphBPH object from a (directed) graphNEL object.
- `graphBPH` signature(graph = "Hypergraph", edgeNodePattern = "missing"): create a graphBPH object from a Hypergraph object (where all Hyperedges are DirectedHyperedges).

**graphBPH-class**

Class "graphBPH"

Description

A bipartite representation of a hypergraph. The purpose of this class is to support visualization of the hypergraph; it is not intended for analysis or manipulation of the hypergraph.

Objects from the Class

Objects can be created by calls of the form `new("graphBPH", graph, edgeNodePattern, ...)`. There is also a convenience function `graphBPH()`.

A graphBPH object consists of a graphNEL object, which must obey some strict rules:

- nodes in the graph are divided into two sets: normal nodes and edge-nodes,
- all edges in the graph must connect a normal node to an edge node,
- the graph must be a directed graph.

The edgeNodePattern is a regular expression that is used to define the set of edge-nodes.
Slots

graph: Object of class graphNEL. This graph must obey the constraints described above.
edgeNodePattern: Object of class character. The regular expression used to define edge-nodes.
nodes: Object of class character. Records which nodes in the graph are normal nodes.
edgeNodes: Object of class character. Records which nodes in the graph are edge-nodes.
edgeNodeIO: Object of class list. Records information about which edges enter and exit each edge-node.

Methods

plot signature(x = "graphBPH", y = "ANY"): draw a representation of the hypergraph where edges between normal nodes in the graph pass through an intermediate edge-node in a nice smooth curve.

graphLayout signature(graph = "graphBPH", layoutType = "missing"): convert the graphBPH object to a RagraphBPH object (using a default layout method).

graphLayout signature(graph = "graphBPH", layoutType = "character"): convert the graphBPH object to a RagraphBPH object (using the specified layout method).

Examples
	nodes <- c(LETTERS[1:5], paste("R", 1:3, sep=""))
testgnel <- new("graphNEL",
   nodes=nodes,
   edgel=list(
     A=list(edges=c("R1", "R2")),
     B=list(edges="R2"),
     C=list(),
     D=list(edges="R3"),
     E=list(),
     R1=list(edges="B"),
     R2=list(edges=c("C", "D")),
     R3=list(edges="E")),
   edgemode="directed")
testbph <- graphBPH(testgnel, "R")
plot(testbph)
# A Hypergraph equivalent

```r
require(hypergraph)
dh1 <- DirectedHyperedge("A", "B", "R1")
dh2 <- DirectedHyperedge(c("A", "B"), c("C", "D"), "R2")
dh3 <- DirectedHyperedge("D", "E", "R3")
hg <- Hypergraph(LETTERS[1:5], list(dh1, dh2, dh3))
plot(graphBPH(hg))
```

## Description

This function is designed to layout a graph using the `Rgraphviz` package. The `hyperdraw` package makes this a generic function with a method for `graphBPH` objects. The function of the same name in the `Rgraphviz` package is used as a method for `Ragraph` objects.

## Usage

```r
graphLayout(graph, layoutType, ...)
```

## Arguments

- `graph` An `graphBPH` object, which is to be laid out.
- `layoutType` The layout method (e.g., dot or neato).
- `...` These arguments will be passed to the `agopen()` function.

## Value

An `RagraphBPH` object.

Examples

```r
nodes <- c(LETTERS[1:5], paste("R", 1:3, sep=""))
testgnel <- new("graphNEL",
    nodes=nodes,
    edgeL=list(
        A=list(edges=c("R1", "R2")),
        B=list(edges="R2"),
        C=list(),
        D=list(edges="R3"),
        E=list(),
        R1=list(edges="B"),
        R2=list(edges=c("C", "D")),
        R3=list(edges="E")),
    edgemode="directed")
testbph <- new("graphBPH", testgnel, "^R")
testrabph <- graphLayout(testbph)
```

RagraphBPH-class

Class "RagraphBPH"

Description

The purpose of this class is to represent a laid out version of a graphBPH object. The laying out is performed by the Rgraphviz package. This is an intermediate step in the process of drawing a graphBPH object.

Objects from the Class

Objects of this class should be created via the graphLayout() function.

Slots

graph: Object of class Ragraph. The laid out graph.

allNodes: Object of class character. The names of all nodes in the graph.

nodes: Object of class character. Records normal nodes in the graph.

touchedNodes: Object of class character. Records edge-nodes in the graph.

edgeNodeIO: Object of class list. Records which edges enter and exit each edge-node.

Methods

plot signature(x = "RagraphBPH", y = "ANY"): draw a representation of the hypergraph where edges between normal nodes in the graph pass through an intermediate edge-node in a nice smooth curve.

edgeDataDefaults<- signature(self = "RagraphBPH", attr = "character", value = "ANY"): set the default drawing attributes for all edges.

drawData<- signature(self = "RagraphBPH", from = "character", to = "character", attr = "character"): set a specific drawing attribute for one or more edges.

drawDataDefaults<- signature(self = "RagraphBPH", attr = "character", value = "ANY"): set the default drawing attributes for all edges.
nodeData<- signature(self = "RagraphBPH", n = "character", attr = "character", value = "ANY")
set a specific attribute for one or more nodes.

graphDataDefaults<- signature(self = "RagraphBPH", attr = "character", value = "ANY")
set the default drawing attributes for the graph.

graphData<- signature(self = "RagraphBPH", n = "character", attr = "character", value = "ANY")
set a specific attribute for the graph.
