Package ‘hypergraph’

January 30, 2017

Title A package providing hypergraph data structures
Version 1.46.0
Author Seth Falcon, Robert Gentleman
Description A package that implements some simple capabilities for representing and manipulating hypergraphs.
Maintainer Bioconductor Package Maintainer
       <maintainer@bioconductor.org>
License Artistic-2.0

DirectedHyperedge-class

Description

A convenience constructor for DirectedHyperedge-class objects

Usage

DirectedHyperedge(head, tail, label = "")

Arguments

- head: Character vector of nodes that are part of the head of the hyperedge
- tail: Character vector of nodes that part of the tail of the hyperedge
- label: A character string describing the directed hyperedge

Value

An object of class DirectedHyperedge-class

Author(s)

Seth Falcon

See Also

DirectedHyperedge-class Hyperedge-class Hypergraph-class

DirectedHyperedge-class

Class DirectedHyperedge

Description

This class represents directed hyperedges in a Hypergraph-class. A directed hyperedge consists of two disjoint sets of nodes, those in the tail and those in the head of the hyperedge. Directed hyperedges are sometimes called hyperarcs.

Objects from the Class

Objects can be created by calls of the form new("DirectedHyperedge", head, tail, label). You can also use the convenience function DirectedHyperedge.

Slots

- tail: Character vector of nodes in the tail of the hyperedge
- head: Character vector of nodes in the head of the hyperedge
- label: Character string describing the directed hyperedge
Hyperedge

Extends
Class “Hyperedge”, directly.

Methods

head signature(x = "DirectedHyperedge"): Return a vector containing the nodes in the head of the hyperedge
tail signature(x = "DirectedHyperedge"): Return a vector containing the nodes in the tail of the hyperedge
initialize signature(.Object = "DirectedHyperedge"): Create a new instance.
nodes signature(object = "DirectedHyperedge"): Return a vector containing all nodes present in the hyperedge.
show signature(object = "DirectedHyperedge"): Print me
toUndirected signature(.Object = "DirectedHyperedge"): Return a Hyperedge-class object that results from coercing to an undirected hyperedge.

Author(s)
Seth Falcon

See Also
DirectedHyperedge Hyperedge Hyperedge-class Hypergraph-class

Examples
head <- LETTERS[1:4]
tail <- LETTERS[19:21]
label <- "Directed hyperedge"
dhe <- new("DirectedHyperedge", head=head, tail=tail, label=label)

Hyperedge Constructor for Hyperedge objects

Description
A convenience constructor for Hyperedge-class objects

Usage
Hyperedge(nodes, label = "")

Arguments
nodes Character vector of nodes that are part of the hyperedge
label A character string describing the hyperedge

Value
An object of class Hyperedge-class
Description

A Hyperedge object represents a hyperedge in a hypergraph, that is, a subset of the nodes of a hypergraph.

Objects from the Class

Objects can be created by calls of the form new("Hyperedge", nodes, label). You can also use the convenience function hyperedge to create instances. This is especially useful for creating a list of Hyperedge instances using `lapply`.

Slots

head: A vector of mode "character" containing the node labels that are a part of the hyperedge
label: An arbitrary "character" string describing this hyperedge

Methods

initialize signature(.Object = "Hyperedge"): Create an instance
label signature(object = "Hyperedge"): Return the value of the label slot
label<- signature(object = "Hyperedge", value = "character"): Set the label slot.
nodes signature(object = "Hyperedge"): Return a vector containing the nodes in the hyperedge
show signature(object = "Hyperedge"): Print a textual summary of the hyperedge

Examples

define nodes as LETTERS[1:4]
define label as "Simple hyperedge"
# Use the convenience constructor
define he as Hyperedge(nodes, label)
Hypergraph

Constructor for Hypergraph objects

Description
A convenience constructor for link(Hypergraph-class) objects

Usage
Hypergraph(nodes, hyperedges)

Arguments
- nodes: A vector of nodes (character)
- hyperedges: A list of Hyperedge-class objects

Value
An object of class Hypergraph-class

Author(s)
Seth Falcon

See Also
Hypergraph-class Hyperedge-class DirectedHyperedge-class

Hypergraph-class

Class Hypergraph

Description
A hypergraph consists of a set of nodes and a set of hyperedges. Each hyperedge is a subset of the node set. This class provides a representation of a hypergraph that is (hopefully) useful for computing.

Objects from the Class
Objects can be created by calls of the form new("Hypergraph", nodes, hyperedges). You can also use the convenience function Hypergraph. The nodes argument should be a character vector of distinct labels representing the nodes of the hypergraph. The hyperedges argument must be a list of Hyperedge-class objects.

Slots
- nodes: A "character" vector specifying the nodes
- hyperedges: A "list" of Hyperedge-class objects
Methods

- **hyperedges** signature(.Object = "Hypergraph"): Return the list of Hyperedge objects
- **hyperedgeLabels** signature(.Object = "Hypergraph"): Return a character vector of labels for the Hyperedge objects in the hypergraph.
- **inciMat** signature(.Object = "Hypergraph"): Return the incidence matrix representation of this hypergraph
- **inciMat2HG** signature(.Object = "matrix"): Return the hypergraph representation of this incidence matrix
- **initialize** signature(.Object = "Hypergraph"): Create an instance
- **nodes** signature(object = "Hypergraph"): Return the vector of nodes (character vector)
- **numNodes** signature(object = "Hypergraph"): Return the number of nodes in the hypergraph
- **toGraphNEL** signature(.Object = "Hypergraph"): Return the graphNEL representation of the hypergraph (a bipartite graph)

Author(s)

Seth Falcon

Examples

```r
nodes <- LETTERS[1:4]
hEdges <- lapply(list("A", LETTERS[1:2], LETTERS[3:4]), "Hyperedge")
hg <- new("Hypergraph", nodes=nodes, hyperedges=hEdges)
```

---

**kCoresHypergraph**  
Find all the k-cores in a hypergraph

Description

Find all the k-cores in a hypergraph

Usage

```r
kCoresHypergraph(hg)
```

Arguments

- `hg`  
an instance of the Hypergraph class

Details

A k-core in a hypergraph is a maximal subhypergraph where (a) no hyperedge is contained in another, and (b) each node is adjacent to at least k hyperedges in the subgraph.

The implementation is based on the algorithm by E. Ramadan, A. Tarafdar, A. Pothen, 2004.
Value

A vector of the core numbers for all the nodes in g.

Author(s)

Li Long <li.long@isb-sib.ch>

References

Examples

# to turn the snacoreex.gxl (from RBGL package) graph to a hypergraph
# this is a rough example
kc_hg_e <- list(c("A", "C"), c("B", "C"), c("C", "E"), c("C", "F"), c("E", "D"), c("E", "F"), c("D", "G"), c("T", "K"
kc_hg_he <- lapply(kc_hg_e, "Hyperedge")
kc_hg <- new("Hypergraph", nodes=kc_hg_n, hyperedges=kc_hg_he)

kCoresHypergraph(kc_hg)

12hel

Create lists of Hyperedge objects

Description

Conveniently create lists of Hyperedge-class instances.

Usage

12hel(e)

Arguments

| e       | A list of character vectors. Each element of the list represents a hyperedge and the character vector value specifies the nodes of the hypergraph that are part of the hyperedge. The names of the list elements, if found, will be used as the label for the corresponding Hyperedge object. |

Value

A list of Hyperedge-class objects. If the list e did not have names, the labels of the Hyperedges will be set to its index in the list coerced to character.

Hyperedge-class Hypergraph-class

Examples

```r
edges <- list("e1"="A", "e2"=c("A", "B"), "e3"=c("C", "D"))
hEdgeList <- l2hel(edges)
```

vCoverHypergraph

Approximate minimum weight vertex cover in a hypergraph

Description

Approximate minimum weight vertex cover in a hypergraph

Usage

```r
vCoverHypergraph(hg, vW=rep(1, numNodes(hg)))
```

Arguments

- `hg`: an instance of the Hypergraph class
- `vW`: vertex weights

Details

Hypergraph g has non-negative weights on its vertices. The minimum weight vertex cover problem is to find a subset of vertices C such that C includes at least one vertex from each hyperedge and the sum of the weights of the vertices in C is minimum. This problem is NP-hard.

We implement the greedy algorithm to approximate near-optimal solution, proposed by E. Ramadan, A. Tarafdar, A. Pothen, 2004.

Value

A list of vertices from hypergraph g.
