Package ‘mAPKL’

January 30, 2017

Type Package
Title A Hybrid Feature Selection method for gene expression data
Version 1.6.0
Date 2015-07-21
Author Argiris Sakellariou
Maintainer Argiris Sakellariou <argisake@gmail.com>
Depends R (>= 3.2.0), Biobase
Imports multtest, clusterSim, apcluster, limma, e1071, AnnotationDbi,
methods, parmigeneigraph,reactome.db
Suggests BiocStyle, knitr, mAPKLDato, hgu133plus2.db, RUnit,
BiocGenerics
VignetteBuilder knitr
Description We propose a hybrid FS method (mAP-KL), which combines multiple hypothesis test-
ing and affinity propagation (AP)-clustering algorithm along with the Krzanowski & Lai clus-
ter quality index, to select a small yet informative subset of genes.
License GPL (>= 2)
biocViews FeatureExtraction, DifferentialExpression, Microarray,
GeneExpression
NeedsCompilation no

Description

A hybrid FS method (mAP-KL), which combines multiple hypothesis testing and affinity propagation (AP) clustering algorithm along with the Krzanowski & Lai cluster quality index, to select an informative subset of genes.

Details

Package: mAPKL
Type: Package
Version: 0.99.01
Date: 2014-05-07
License: GPL (>= 2)

Author(s)

Argiris Sakellariou <a.sakellariou@gonkhosp.gr>

References

Annot-class

Description

S4 class for storing Annot analysis results

Slots

The following slots are defined for Annot objects:

- results: The accumulated annotation results
- probe: The probe id
- symbol: The official gene symbol
annotate

entrezId: The Entrez gene Identifier
ensembleId: The ensembl ID as indicated by ensembl
map: The cytoband locations of the gene

Author(s)

Argiris Sakellariou <a.sakellariou@gonkhosp.gr>

annotate(exemplars,chip)

Description

The user may extract several genome specific information for the "exemplars" as described in the microarray annotation file.

Usage

annotate(exemplars,chip)

Arguments

exemplars The "exemplars" of the mAPKL class.
chip The platforms’s name of the microarray chip used (e.g. "hgu133plus2.db")

Details

This function uses as key the probe id and returns the matching information as described in the gene chip annotation file. The returned information are usually multiple to the number of probe ids (one to many relationship).

Value

results The accumulated annotation results.
probe The probe id.
symbol The official gene symbol.
etrezId The Entrez gene Identifier.
ensembleId The ensembl ID as indicated by ensembl.
map The cytoband locations of the gene.

Author(s)

Argiris Sakellariou
Examples

```r
## We use the "exemplars" from the mAPKL.Rd example

exemplrs <- c(24, 26, 42, 45, 63, 81, 95, 99, 102, 113, 124, 125, 145, 152, 168)
names(exemplrs) <- c("215717_s_at", "1561358_at", "222752_s_at", "233922_at", "218871_x_at", "23323_r_at", "244311_at", "228932_at", "205508_at", "209598_at", "216830_at", "215630_at", "215852_at", "229947_at", "221731_x_at")
gene.info <- annotate(exemplrs,"hgu133plus2.db")
```

### classification

Classify samples according to the SVM algorithm

#### Description

This function performs classification through the Support Vector Machines (SVM) algorithm. The algorithm applies on the "exemplars" dataset. It produces a classification result either on the training set or on a validation set. This function estimates how well the selected "genes" from mAP-KL method discriminate between two phenotypes. The default SVM settings are: "linear" kernel and 5-folds cross-validation. Regarding the parameters for the "linear" kernel, cost parameter, and for the "radial" kernel, cost and gamma parameters, are estimated automatically through the tune.svm function as described in e1071 r-package.

#### Usage

```r
classification(trExemplObj,classLabels,valExemplObj=NULL,kf=5,kernel="linear")
```

#### Arguments

- `trExemplObj` The exemplars train eSet object.
- `classLabels` The varLabels name in the eSet object where the class labels are stored e.g "type".
- `valExemplObj` The exemplars validation eSet object (if not NULL).
- `kf` The k-folds value of the cross-validation parameter. The default value is 5-folds. By setting "Loo" or "LOO" a Leave-One-Out Cross Validation is performed
- `kernel` The type of kernel used for the classification analysis. The default kernel is "linear"

#### Value

- `classL` The labels of the train set
- `valClassL` The labels of the validation set if not NULL
- `predLbls` The predicted labels according to the classification analysis

#### Author(s)

Argiris Sakellariou
**Classify-class**

Class "Classify"

**Description**

S4 class for storing Classify analysis results

**Slots**

The following slots are defined for Classify objects:

- `classL`: Number of samples in the data set
- `valClassL`: Subset of samples used for leveraged clustering
- `predLbls`: Vector containing indices of exemplars
- `AUC`: The Area Under the ROC curve as a degree of samples discrimination
- `Accuracy`: The classification accuracy
- `MCC`: The MCC classification measure
- `Specificity`: The degree of true negative's identification
- `Sensitivity`: The degree of true positive's identification

**Author(s)**

Argiris Sakellariou <a.sakellariou@gonkhosp.gr>
DataLD-class  

Class "DataLD"

Description

S4 class for storing DataLD analysis results

Slots

The following slots are defined for DataLD objects:

- trainObj: An eSet class object of a training set
- valObj: An eSet class object of a validation set

Author(s)

Argiris Sakellariou <a.sakellariou@gonkhosp.gr>

loadFiles

Imports gene expression data

Description

This function loads the train set, the class labels files as well as the test or validation file if any. Then we may perform normalization and (or) log2 transformation.

Usage

loadFiles(filesPath, trainFile, labelsFile, validationFile=NULL, validationLabels=NULL)

Arguments

- filesPath: The path where the files are stored
- trainFile: The genes and the relevant intensity values for feature selection analysis. The file should be of tab-delimited format
- labelsFile: The class labels of the samples
- validationFile: A further file with genes and intensity values used for validation purposes
- validationLabels: The class labels of the validation samples

Value

An object of Class DataLD

Author(s)

Argiris Sakellariou
mAPKL

The mAP-KL algorithm

Description

We first employ the mt.maxT function from the "multtest" package to rank the genes of the training set and then we reserve the top N genes e.g. (N = 200) for further exploitation. Prior to clustering analysis with Affinity Propagation we apply the index of Krzanowski and Lai as included in the "ClusterSim" package to determine the number of clusters solely on the disease samples of the training test set. The final step involves the cluster analysis with the AP clustering method as in the "apcluster" package, which detects n (n = k, the Krzanowski and Lai index) clusters among the top N genes and provides us with a list of the most representative genes of each cluster, the so called exemplars.

Usage

mAPKL(trObj,classLabels,valObj=NULL,dataType=6,statTest="t",permutations=1000, features=200,minClusters=2,maxClusters=50,FC="limma",bimaxit=50,r=2)

Arguments

trObj | The train eSet object.

classLabels | The varLabels name in the eSet object where the class labels are stored e.g "type".

valObj | The validation eSet object (if not NULL).

dataType | The type of the data e.g 6-ratio data without normalization and 7-interval or mixed (ratio & interval) data without normalization as described in "clusterSim" package.

statTest | The statistical test applied to the geneIntensities. The available tests described in mt.maxT documentation in "multtest" package.

permutations | The number of permutations.

features | The top N genes to be kept.

minClusters | The minimum number of clusters that can be identified.

maxClusters | The maximum number of clusters that can be identified.

FC | The Fold Change of the exemplars according to "Limma" (default). Alternatively the "SAM" approach may be computed.

bimaxit | The maximum number of bisection steps performed by the AP algorithm. The (default) value is "50".

r | The argument r is used to transform the resulting distances by computing the r-th power. To obtain negative squared distances as in Frey’s and Dueck’s (use r=2 as default).

Value

rankedIntens | The top N ranked genes with their intensity values

exemplTrain | The intensity values of the exemplars in the training set

exemplTest | The intensity values of the exemplars in the validation set if not NULL
### mAPKLRes-class

**Description**

S4 class for storing mAPKL analysis results

**Slots**

The following slots are defined for `mAPKLRes` objects:

- `rankedIntens`: The top N ranked genes along with their intensity values
- `exemplTrain`: An eSet class object formed with the exemplars of the training set
- `exemplTest`: An eSet class object formed with the exemplars of the validation set if not NULL

---

```r
## Using separate train-test samples
## Load the necessary files based on Breast cancer data as included in the
## package mAPKLData
library(mAPKLData)
data(mAPKLData)
breast <- sampling(Data=mAPKLData, valPercent=40, classLabels="type", seed=135)
normTrainData <- preprocess(breast$trainData)
normTestData <- preprocess(breast$testData)
exprs(breast$trainData) <- normTrainData$clL2.normdata
exprs(breast$testData) <- normTestData$clL2.normdata
out.clL2 <- mAPKL(trObj=breast$trainData, classLabels="type",
val0bj=breast$testData, dataType=7)
```

---

Author(s)

Argiris Sakellariou

References

A list with the overall results of the "mt.maxT" analysis

adjp: The adjusted p-values according to the statistical analysis

pVal: The raw p-values according to the statistical analysis

fc: The Fold Change of the exemplars

exemplars: The selected "significant" probe ids/genes

clusters: The probe ids/genes per cluster

Author(s)

Argiris Sakellariou <a.sakellariou@gonkhosp.gr>

---

**Description**

This function calculates several classification related metrics. It uses the original and the predicted samples' labels to quantify the quality of the classification process. Those measures give us a direct outlook of the selected "genes" and how well discriminate between two phenotypes.

**Usage**

```r
metrics(classLbls, predLbls)
```

**Arguments**

- `classLbls`: The initial class labels.
- `predLbls`: The predicted class labels.

**Value**

- **AUC**: The Area Under the ROC curve as a degree of samples discrimination
- **Accuracy**: The classification accuracy
- **MCC**: The MCC classification measure
- **Specificity**: The degree of true negative's identification
- **Sensitivity**: The degree of true positive's identification

**Author(s)**

Argiris Sakellariou

**Examples**

```r
## Suppose 'val' represent the correct validation set labels
## and 'predictions' the predicted labels according to an SVM model

val <- c(rep(0,8),rep(1,4))
predictions <- c(rep(0,6),1,1,rep(1,3),0)
perfMetrics <- metrics(classLbls=val, predLbls=predictions)
```
NetAttr-class  

Class "NetAttr"

Description

S4 class for storing some network characteristics of the top ranked genes

Slots

The following slots are defined for NetAttr objects:

edgelist: The Node1 & Node2 & Weight edgelist matrix
degree: The Local, Global and their Weighted values of the "degree" characteristic
closeness: The Weighted values of the Local and Global "closeness" characteristic
betweenness: The Weighted values of the Local and Global "betweenness" characteristic
transitivity: The Weighted values of the Local and Global "transitivity" characteristic

Author(s)

Argiris Sakellariou <a.sakellariou@gonkhosp.gr>

netwAttr  

Calculates network characteristics

Description

Calculate some basic network characteristics of the top ranked genes

Usage

netwAttr(mAPKLObj, net="clr")

Arguments

mAPKLObj  
An object of mAPKL class.

net  
The network reconstruction method to be employed. The user may select between "clr" (default), "aracne.a" and "aracne.m".

Details

It calculates some basic network characteristics. Those include the "degree", the "closeness", the "betweenness", and finally the "transitivity" or else clustering coefficient. We calculate the weighted values for both local and global scores.

The three available network reconstruction options are:

clr: Context Likelihood or Relatedness Network
aracne.a: Algorithm for the Reconstruction of Accurate Cellular Networks (additive model)
aracne.m: Algorithm for the Reconstruction of Accurate Cellular Networks (multiplicative model)
preprocess

Value

Upon successful completion, the function returns an NetAttr object.

Author(s)

Argiris Sakellariou

Examples

```r
library(mAPKLDATA)
data(mAPKLDATA)
breast <- sampling(Data=mAPKLDATA, valPercent=40, classLabels="type", seed=135)
normTrainData <- preprocess(breast$trainData)
normTestData <- preprocess(breast$testData)

exprs(breast$trainData) <- normTrainData$clL2.normdata
exprs(breast$testData) <- normTestData$clL2.normdata

out.clL2 <- mAPKL(trObj=breast$trainData, classLabels="type", valObj=breast$testData, dataType=7)

net.attr <- netwAttr(mAPKLObj=out.clL2)
```

---

**preprocess**

*Performs normalization and/or log2 transformation*

**Description**

This function performs normalization and/or log2 transformation on gene expression data.

**Usage**

```r
preprocess(exprsObj, log2=TRUE, norm="ALL", destname=NULL)
```

**Arguments**

- **exprsObj**: An eSet object where its assay data will be normalized
- **log2**: Performs logarithmic transformation of base 2 prior to any normalization. The default value is TRUE
- **norm**: The user may define a specific normalization method rather than "ALL" which is the default case. The available abbreviations are described in the details section
- **destname**: Here we define the destination path and the name of the jpeg file with the density plots. The default path is the working directory
Details

The available normalization methods are:
Mean-centering normalization "mc"
Z-score normalization "z"
Quantile normalization "q"
Cyclic loess normalization "cl"
Mean-centering normalization and log2 transformation "mcL2"
Z-score normalization and log2 transformation "zL2"
Quantile normalization and log2 transformation "qL2"
Cyclic loess normalization and log2 transformation "clL2"

Value

rawdata  The initial gene expression values
mc.normdata  The values after ‘mean-centering’ normalization
z.normdata  The values after ‘z-score’ normalization
q.normdata  The values after ‘quantile’ normalization
cl.normdata  The values after ‘cyclic loess’ normalization
mcL2.normdata  The values after ‘mean-centering’ normalization and log2
zL2.normdata  The values after ‘z-score’ normalization and log2
qL2.normdata  The values after ‘quantile’ normalization and log2
clL2.normdata  The values after ‘cyclic loess’ normalization and log2

Author(s)

Argiris Sakellariou

Examples

library(mAPKLData)
data(mAPKLData)
varLabels(mAPKLData)
breast <- sampling(Data=mAPKLData, valPercent=40, classLabels="type", seed=135)
normTrainData <- preprocess(exprsObj=breast$trainData)

---

probes2pathways  Extract pathways from "exemplars"

Description

The user may extract the pathways where the "exemplars" are involved with the aid of the reactome database.

Usage

probes2pathways(annotObj)
**Arguments**

annotObj  The "Annot" class object.

**Details**

This function utilizes the "Annot" class object as returned by the "annotate" function to extract the pathways where the "exemplars" are involved with the aid of the "reactome" database. We employ the probe Ids for the matching.

**Author(s)**

Argiris Sakellariou

**Examples**

```r
## We use the "exemplars" from the mAPKL.Rd example
exemplrs <- c(24, 26, 42, 45, 63, 81, 95, 99, 102, 113, 134, 135, 145, 152, 168)
names(exemplrs)<- c("215717_s_at", "1561358_at", "222752_s_at", "233922_at",
"218871_x_at", "33323_r_at", "244311_at", "220932_at", "205508_at", "209596_at",
"215180_at", "1560638_s_at", "201852_x_at", "229947_at", "221731_x_at")

gene.info <- annotate(exemplrs,"hgu133plus2.db")

## We now use the "gene.info" to identify the relevant pathways
probes2pathways(gene.info)
```

---

**Description**

This function gathers the results of several analysis sessions (feature selection, classification, annotation and network) and produces a report in HTML format.

**Usage**

```r
report(mAPKLObj, ClassifyObj, AnnotObj=NULL, netObj=NULL, file)
```

**Arguments**

- mAPKLObj  An object of mAPKL class.
- ClassifyObj  An object of mAPKL class.
- AnnotObj  An object of Annot class.
- netObj  An object of NetAttr class.
- file  The full path and the name of the produced report
Details

It presents the data samples with their phenotype labels, the exemplars with their statistical scores (adj.p-value, p-value and fc), and network characteristics (like weighted local degree, closeness, betweenness, transitivity) if such a network analysis has been performed. In addition, the report presents the classification performance achieved by those exemplars (either cross-validation or hold-out), and finally several annotation information (symbol, entrez id, ensemble id, and their chromosomal location) if an annotation analysis has been carried out.

Value

Upon successful completion an HTML report is saved in the working directory.

Author(s)

Argiris Sakellariou

Examples

```r
## When a network attributes object is present
## Not run: report(out,class.pred,class.metrics,netObj=net.attr,  
## "C:/.../.../mAPKLreport.html")#Define a local path to store your report
## End(Not run)

## When an annotation object is present
## Not run: report(out,class.pred,class.metrics,gene.info,   
## "C:/.../.../mAPKLreport.html")#Define a local path to store your report
## End(Not run)

## Without annotation and network attributes objects
## Not run: report(out,class.pred,class.metrics,  
## file="C:/.../.../mAPKLreport.html")#Define a local path to store your report
## End(Not run)
```

Sampling

Splits a dataset to a train and a test sets of a user defined percentage

Description

This function takes as input a dataset and splits it into a train and a test set based to a user defined percentage.

Usage

```r
sampling(Data,valPercent,classLabels,seed)
```

Arguments

- **Data**: The input dataset to be split as an eSet object.
- **valPercent**: The percentage of the input dataset used for validation purposes e.g. 40.
- **classLabels**: The varLabels name in the eSet object where the class labels are stored e.g "type".
- **seed**: Setting the seed number for reproducible sampling. The default value is 1.
Value

- **trainData**: The data used for training as an eSet object
- **testData**: The data used for validation as an eSet object

Author(s)

Argiris Sakellariou

Examples

```r
library(mAPKLData)
data(mAPKLData)
breast <- sampling(Data=mAPKLData, valPercent=40, classLabels="type", seed=135)
```
