Package ‘psygenet2r’

November 15, 2016

*Title*  psygenet2r - An R package for querying PsyGeNET and to perform comorbidity studies in psychiatric disorders

*Version*  1.6.1

*Description*  Package to retrieve data from PsyGeNET database (www.psygenet.org) and to perform comorbidity studies with PsyGeNET's and user's data.

*Depends*  R (>= 3.3)

*License*  MIT + file LICENSE

*LazyData*  true

*Suggests*  testthat

*Imports*  stringr, RCurl, igraph, ggplot2, reshape2, grid, parallel, biomaRt, BgeeDB, topGO, BiocInstaller

*NeedsCompilation*  no

*Author*  Alba Gutierrez-Sacristan [aut], Carles Hernandez-Ferrer [cre]

*Maintainer*  Alba Gutierrez-Sacristan <alba.gutierrez@upf.edu>

*biocViews*  Software, BiomedicalInformatics, Genetics, Infrastructure, DataImport, DataRepresentation

*RoxygenNote*  5.0.1

Description

Class DataGeNET.Psy is the basic object use in psygenet2r package. It is the main data container to using the different functions to query PsyGeNET database and generate their output. The constructors of this class are the functions psygenetGene and psygenetDisease.

Slots

type Character containing 'gene' of 'disease'. It is used to perform the correct query to PsyGeNET.

search Character containing 'single' of 'list'. It is used to perform the correct query to PsyGeNET.

database Character containing the name of the database that will be queried. It can take the values 'MODELS' to use Comparative Toxigenomics Database, data from mouse and rat; 'GAD' to use Genetic Association Database; 'CTD' to use Comparative Toxigenomics Database, data from human; 'PsyCUR' to use Psychiatric disorders Gene association manually curated; 'CURATED' to use Human, manually curated databases (PsyCUR and CTD); or 'ALL' to use all these databases.

term Character with the term(s) to search into the database(s).

qresult data.frame with the obtained result

See Also

psygenetGene, psygenetDisease, DataGeNET.Psy-methods

enrichedPD

Enrichment of a user's input (genes) in PsyGeNET's diseases.

Description

Test the enrichment of a given gene list on Psychiatric Disorders from PsyGeNET.

Usage

enrichedPD(gene, database = "ALL", verbose = FALSE, warnings = FALSE)
extract

Arguments

gene Name or vector of names (that can be both code or uml) to specific genes from PsyGeNET.
database Name of the database that will be queried. It can take the values 'psycur15' to use data validated by experts for first release of PsyGeNET; 'psycur16' to use data validated by experts for second release of PsyGeNET; or 'ALL' to use both databases. Default 'ALL'.
verbose By default FALSE. Change it to TRUE to get a on-time log from the function.
warnings By default TRUE. Change it to FALSE to not see the warnings.

Value

A data.frame with the enrichment at each Psychiatric Disorder

Examples

enrichedPD(c("ADCY2", "AKAP13", "ANK3"), "ALL")

Description

Obtain the raw data from a PsyGeNET's query stored in a DataGeNET.Psy object or the raw data with all the Jaccard Index for the disease of interest of an JaccardIndexPsy object.

Usage

extract(object, ...)

## S4 method for signature 'DataGeNET.Psy'
extract(object)

## S4 method for signature 'JaccardIndexPsy'
extract(object, order.cl = "pval", ...)

Arguments

object Object of class DataGeNET.Psy or JaccardIndexPsy
... NO USED
order.cl Order resulting data.frame by the name of this column.

Value

A data.frame containing the raw result from PsyGeNET or a data.frame with the result Jaccard Index for each disease.
A data.frame containing the raw result from PsyGeNET
A data.frame with the result Jaccard Index for each disease.
extractSentences

Method to obtain the evidences from a DataGeNET.Psy object.

extractSentences

Description

Internally, PsyGeNET uses a series of collected evidences from public literature. The internal table of a DataGeNET.Psy object can contains this information. The method extractSentences allows to extrat this information.

Usage

extractSentences(object, disorder, verbose)

## S4 method for signature 'DataGeNET.Psy'
extractSentences(object, disorder, verbose = FALSE)

Arguments

object Object of class DataGeNET.Psy.
disorder A disorder to check if any evidence exists.
verbose If set to TRUE informative messages are show.

Value

A data frame showing the evidence.

Methods (by class)

• DataGeNET.Psy: Get sentences or evidences

Examples

data(qr)
extractSentences(qr, "Depression")
geneAttrPlot

Ploting the relation between genes and disease-categories

Description
Given a set of genes or a result of psygenetGene creates four types of plots showing the relation of the genes with the disease’s category in psyGeNET.

Usage
geneAttrPlot(x, type = "pie", verbose = FALSE)

Arguments
- **x**: Vector of genes of interest of DataGeNET.Psy resulting of psyegnetDisease.
- **type**: (default "pie") It can takes "pie".
- **verbose**: By default FALSE. Change it to TRUE to get a on-time log from the function.

Value
A plot for a DataGeNET.Psy in terms of the panther-class.

getUMLs
Query PsyGeNET for given gene(s) and generates an DataGeNET.Psy

Description
Given the name of one or multiple gene and retrieves their information from PsyGeNET and creates an object of type DataGeNET.Psy.

Usage
getUMLs(word, database = "ALL")

Arguments
- **word**: Disease to convert to UMLS using PsyGeNET database.
- **database**: Name of the database that will be queried. It can take the values ’psycur15’ to use data validated by experts for first release of PsyGeNET; ’psycur16’ to use data validated by experts for second release of PsyGeNET; or ’ALL’ to use both databases. Default ’ALL’.

Value
The corresponding UMLs for the input disease/s

Examples
umls <- getUMLs( word = "depressive", database = "ALL" )
jaccardEstimation  

Calculation of the Jaccard Index between ideseases

Description

This function is able to calculate the Jacard Index between: 1. multiple diseases, 2. a set of genes and multiple diseases, 3. a set of genes and multiple main psychiatric disorders and 4. multiple diseases and multiple main psychiatric disorders.

Usage

jaccardEstimation(pDisease, sDisease, database = "ALL", nboot = 100, 
ncores = 1, verbose = FALSE)

Arguments

pDisease  
vector of diseases, vector of genes, vector of main psychiatric disorder.

sDisease  
vector of diseases, vector of genes, vector of main psychiatric disorder. Only necessary when comparing genes vs. diseases, genes vs. main psychiatric disorders or diseases vs. main psychiatric disorders. To compare multiple diseases only use pDisease.

database  
Name of the database that will be queried. It can take the values 'psycur15' to use data validated by experts for first release of PsyGeNET; 'psycur16' to use data validated by experts for second release of PsyGeNET; or 'ALL' to use both databases.

nboot  
Number of iterations sued to compute the pvalue associated to the calculated Jaccard Index (default 100).

ncores  
Number of cores used to calculate the pvalue associated to the computed Jaccard Index (default 1).

verbose  
By default FALSE. Change it to TRUE to get a on-time log from the function.

Details

Warning: The main psychiatric disorders are understood as a single set of genes composed by the genes of all the diseases that the main psychiatric disorder contains.

Value

An object of class JaccardIndexPsy with the computed calculation of the JaccardIndex.

Examples

ji <- jaccardEstimation( c("COMT", "CLOCK", "DRD3" ), "umls:C0005586", "ALL" )
Description

Class `JaccardIndexPsy` is the result of the process to look for a Jaccard Index between multiple diseases in `psygenet2r` package.

Slots

- `nit` Number of iterations to calculate the estimated Jaccard index
- `type` Slot to save type of query (disease-disease, gene-disease)
- `table` data.frame containing the result table of Jaccard indexes
- `i1` [internal use] vector with names of first component
- `i2` [internal use] vector with names of second component

See Also

`psygenetGene`, `psygenetDisease`, `JaccardIndexPsy-methods`

Examples

```r
ji <- jaccardEstimation(c("COMT", "CLOCK", "DRD3"), "umls:C0005586", "ALL")
```

ndisease

*Getter from DataGeNET.Psy.*

Description

Obtain the number of unique diseases in a `DataGeNET.Psy`.

Usage

```r
ndisease(object)
```

## S4 method for signature 'DataGeNET.Psy'

```r
ndisease(object)
```

Arguments

- `object` Object of class `DataGeNET.Psy`.

Value

The number of unique diseases

Methods (by class)

- `DataGeNET.Psy`: Get number of diseases
**Examples**

```r
data(qr)
ndisease(qr)
```

```r
ngene(qr)
```

---

**Description**

Obtain the number of unique genes in a DataGeNET.Psy.

**Usage**

```r
ngene(object)
```

```r
## S4 method for signature 'DataGeNET.Psy'
ngene(object)
```

**Arguments**

- `object`: Object of class `DataGeNET.Psy`.

**Value**

The number of unique genes

**Methods (by class)**

- `DataGeNET.Psy`: Get number of genes

**Examples**

```r
data(qr)
ngene(qr)
```

---

**pantherGraphic**

*Query PsyGeNET for given genes and creates a representation in base of their panther-class*

**Description**

Given a vector of genes of interest (or using a DataGeNET.Psy object), this function creates a representation of a the panther-class these genes belongs to.

**Usage**

```r
pantherGraphic(x, database = "ALL", score, verbose = FALSE)
```
Arguments

x: Vector of genes of interest of DataGeNET.Psy resulting of psyegnetDisease.

database: Name of the database that will be queried. It can take the values 'psycur15' to use data validated by experts for first release of PsyGeNET; 'psycur16' to use data validated by experts for second release of PsyGeNET; or 'ALL' to use both databases. Default 'ALL'.

score: threshold to take into account a gene in the analysis

verbose: By default FALSE. Change it to TRUE to get a on-time log from the function.

Value

A plot for a DataGeNET.Psy in terms of the panther-class.

Examples

d.alch <- pantherGraphic( c("COMT", "CLOCK", "DRD3" ), "ALL" )

Description

This functions llows to create a variety of plots for DataGeNET.Psy and JaccardIndexPsy objects.

Usage

## S4 method for signature 'DataGeNET.Psy,ANY'
plot(x, y, 
    layout = igraph::layout.fruchterman.reingold, type = "disease", 
    verbose = FALSE, ...)

Arguments

x: Object of class DataGeNET.Psy

y: NOT USED

layout: Function to design the location of the different nodes. By default layout.fruchterman.reingold from igraph is used.

type: Type of the drawn chart. By default it is "disease" but it also can be "individual disease", "disease", "disease class", "barplot", "heatmapGenes" or "heatmap".

verbose: By default FALSE. If set to TRUE information on the drawing process will be shown.

...: Passed to inner functions for different plots.

Value

A plot for DataGeNET.Psy.
Examples

data(qr)
plot(qr) # for all-disease plot
plot(qr, type = 'disease class') # for MPI plot

plot,JaccardIndexPsy,ANY-method

Plot the content of a JaccardIndexPsy object.

Description

This function allows to create a variety of plots for DataGeNEt.Psy and JaccardIndexPsy objects.

Usage

## S4 method for signature 'JaccardIndexPsy,ANY'
plot(x, y, cutOff, zero.remove = TRUE, 
     noTitle = FALSE, verbose = FALSE, ...)

Arguments

x Object of class JaccardIndexPsy.
y NOT USED
cutOff Number to filter the shown results.
zero.remove By default TRUE. It removes those relations with a Jaccard Index of 0.
noTitle By default FALSE. If set to true no title will be added to the plot.
verbose By default FALSE. If set to TRUE information on the drawing process will be shown.
... NOT USED

Value

A plot for JaccardIndexPsy.

Examples

## Not run:
#Being x an JaccardIndexPsy
qr <- plot(x)

## End(Not run)
psygenet2r

psygenet2r: Package to query PsyGeNET database and to perform comorbidity studies

Description

psygenet2r has two categories of functions: querying functions and analysis and plotting functions.

querying functions

The functions to retrieve data from PsyGeNET are psygenetDisease and psygenetGene. There are some other support functions like psygenetGeneSentences.

analysis and plotting functions

The functions extract and extractSentences allows to retrieve the row data obtained from on-line resources. The functions plot and pantherGraphic draws a variety of charts to illustrate the obtained results. The function enrichedPD was built to perform enrichment studies on PsyGeNET data. Finally the function jaccardEstimation computes a Jaccard Index from a given input on PsyGeNET data.

psygenetDisease

Query PsyGeNET for given disease(s) and generates an object of type DataGeNET.Psy

Description

Given the name of one or multiple diseases and retrieves their information from PsyGeNET and creates an object of type DataGeNET.Psy.

Usage

psygenetDisease(disease, database = "ALL", score = c(">", 0), verbose = FALSE, warnings = TRUE)

Arguments

disease
Name or vector of names (that can be both code or uml) to specific diseases from PsyGeNET. The diseases non existing in PsyGeNET will be removed from the output.

database
Name of the database that will be queried. It can take the values 'psycur15' to use data validated by experts for first release of PsyGeNET; 'psycur16' to use data validated by experts for second release of PsyGeNET; or 'ALL' to use both databases. Default 'ALL'.'

score
A vector with two elements: 1) character with greather '>' or with lower '<' meaning greater or equal and lower or equal; 2) the evidence index cut-off to be compared. By default: c(">", 0).

verbose
By default FALSE. Change it to TRUE to get a on-time log from the function.

warnings
By default TRUE. Change it to FALSE to don’t see the warnings.
psygenetDiseaseSentences

Value
An object of class DataGeNET.Psy

Examples
d.sch <- psygenetDisease( "schizophrenia", "ALL" )

psygenetDiseaseSentences

Query PsyGeNET for given disease(s) and extract the pmids sentences that report a gene-disease association.

Description
Given a disease or a disease list, retrieves the pmids and sentences for each gene-disease association from PsyGeNET and creates an object of type DataGeNET.Psy.

Usage
psygenetDiseaseSentences(diseaseList, database = "ALL", verbose = FALSE)

Arguments
diseaseList Name or vector of names (that can be both code or uml) to specific diseases from PsyGeNET. The diseases non existing in PsyGeNET will be removed from the output.
database Name of the database that will be queried. It can take the values 'psycur15' to use data validated by experts for first release of PsyGeNET; 'psycur16' to use data validated by experts for second release of PsyGeNET; or 'ALL' to use both databases. Default 'ALL'.
verbose By default FALSE. Change it to TRUE to get a on-time log from the function.

Value
An object of class DataGeNET.Psy

Examples
diseasesOfInterest <- c( "Bipolar Disorder","Depressive Disorder, Major" )
psyDisSen <- psygenetDiseaseSentences( diseaseList = diseasesOfInterest, database = "ALL" )
**psygenetGene**

*PsyGeNET for given gene(s) and generates an DataGeNET.Psy*

---

**Description**

Given the name of one or multiple gene and retrieves their information from PsyGeNET and creates an object of type `DataGeNET.Psy`.

**Usage**

```r
psygenetGene(gene, database = "ALL", score = c(">", 0), verbose = FALSE, warnings = TRUE)
```

**Arguments**

- `gene`: Name or vector of names (that can be both code or symbol) to specific genes from PsyGeNET. The genes non existing in PsyGeNET will be removed from the output.
- `database`: Name of the database that will be queried. It can take the values "Varpsycur15" to use data validated by experts for first release of PsyGeNET; "Varpsycur16" to use data validated by experts for second release of PsyGeNET; or "ALL" to use both databases. Default "ALL".
- `score`: A vector with two elements: 1) character with greater '>' or with lower '<' meaning greater or equal and lower or equal; 2) the evidence index cut-off to be compared. By default: c(">", 0).
- `verbose`: By default FALSE. Change it to TRUE to get a on-time log from the function.
- `warnings`: By default TRUE. Change it to FALSE to not see the warnings.

**Value**

An object of class `DataGeNET.Psy`

**Examples**

```r
d.alch <- psygenetGene("ALDH2", "ALL")
```

---

**psygenetGeneSentences**

*PsyGeNET for given gene(s) and extract the pmids sentences that report a gene-disease association.*

---

**Description**

Given a gene or a gene list, retrieves the pmids and sentences for each gene-disease association from PsyGeNET and creates an object of type `DataGeNET.Psy`.

**Usage**

```r
psygenetGeneSentences(geneList, database = "ALL", verbose = FALSE)
```
Arguments

- **geneList**: Name or vector of names (that can be both code or symbol) to specific genes from PsyGeNET. The genes non-existing in PsyGeNET will be removed from the output.
- **database**: Name of the database that will be queried. It can take the values 'psycur15' to use data validated by experts for first release of PsyGeNET; 'psycur16' to use data validated by experts for second release of PsyGeNET; or 'ALL' to use both databases. Default 'ALL'.
- **verbose**: By default FALSE. Change it to TRUE to get a on-time log from the function.

Value

An object of class DataGeNET.Psy

Examples

```r
genesOfInterest <- c("PECR", "ADH1C", "CAST", "ERAP1", "PPP2R2B", "ESR1", "GATA4", "CDH13")
p psyGeneSen <- psygenetGeneSentences(geneList = genesOfInterest, database = "ALL")
```

```r
DataGeNET.Psy obtained from querying PsyGeNET for gene '4852'.
```

Description

A dataset obtained from PsyGeNET after being queried with psygenetGene using the term ‘4852’ on "ALL" database.

Usage

```r
data("qr")
```

Format

The format is: Formal class 'DataGeNET.Psy' [package "psygenet2r"] with 5 slots .. type : chr "gene" .. search : chr "" .. database: chr "ALL" .. term : chr "4852" .. qresult :data.frame'

Value

A DataGeNET.Psy object.

Source

http://psygenet.org

Examples

```r
ngene(qr)
ndisease(qr)
```
**Description**

Test the enrichment of a given gene list on Psychiatric Disorders from PsyGeNET.

**Usage**

```r
topAnatEnrichment(gene, dataType = "rna_seq", statistic = "fisher",
cutOff = 1, verbose = FALSE, warnings = FALSE)
```

**Arguments**

- `gene`: Name or vector of names (that can be both code or uml) to specific genes from PsyGeNET.
- `dataType`: It can take the values 'rna_seq' or 'affymetrix'. Default 'rna_seq'.
- `cutOff`: Default 1.
- `verbose`: By default FALSE. Change it to TRUE to get a on-time log from the function.
- `warnings`: By default TRUE. Change it to FALSE to not see the warnings.
- `statistic`: Default 'fisher'.

**Value**

A `data.frame` with the enrichment results

**Examples**

```r
## Not run:
topAnatEnrichment(c("ADCY2", "AKAP13", "ANK3"), "ALL")
## End(Not run)
```
