Package ‘rBiopaxParser’

November 21, 2016

Type Package
Title Parses BioPax files and represents them in R
Version 2.14.0
Date 2016-08-26
Author Frank Kramer
Maintainer Frank Kramer &lt;dev@frankkramer.de&gt;
Description Parses BioPAX files and represents them in R, at the moment BioPAX
level 2 and level 3 are supported.
License GPL (&gt;= 2)
Depends R (&gt;= 3.0.0), data.table
Imports XML
Suggests Rgraphviz, RCurl, graph, RUnit, BiocGenerics, nem, RBGL,
igraph
URL https://github.com/frankkramer-lab/rBiopaxParser
biocViews DataRepresentation
RoxygenNote 5.0.1
NeedsCompilation no

Description

Parses BioPax files and represents them in R

Details

rBiopaxParser is a...

Author(s)

Frank Kramer <dev@frankkramer.de>

Examples

## Not run: biopax = readBiopax(file="biopaxmodel.owl")

addBiochemicalReaction

This function adds a new biochemical reaction to the biopax model.

Description

This function adds a new biochemical reaction of class biochemicalReaction to the biopax model. This is a convenience function, internally the function addBiopaxInstance is called with properties LEFT and RIGHT set.

Usage

addBiochemicalReaction(biopax, LEFT = c(), RIGHT = c(), id = NULL)
addBiopaxInstance

Arguments

biopax A biopax model
LEFT vector of strings. IDs of the physicalEntityParticipant instances that are on the left side of this reaction.
RIGHT vector of strings. IDs of the physicalEntityParticipant instances that are on the right side of this reaction.
id string. ID for the control. If NULL a new ID is generated with prefix "biochemicalReaction".

Value

Returns the biopax model with the added pathway.

Author(s)

fkramer

Examples

biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax$dt

addBiopaxInstance This function adds a new instance to an existing biopax model.

Description

This function adds a new instance to an existing biopax model. "properties" is a named list of vectors, with the vector name as the name of the property and every entry of the vector a property value. Please note: case sensitivity! In Biopax Level 2 all properties are written in all capital letters. This will change in Biopax Level 3.

Usage

addBiopaxInstance(biopax, class, id, properties = list(NAME = c()),
verbose = TRUE)

Arguments

biopax A biopax model
class string. Class name
id string. ID of the instance
properties named list of properties.
verbose logical. Be verbose about what was added.
addBiopaxInstances

Value

Returns the supplied biopax model with the new instance added.

Author(s)

Frank Kramer

Examples

biopax = createBiopax(level=2)
biopax = addBiopaxInstance(biopax, class="protein", id="id1", properties=list(NAME="protein1",SYNONYMS="p1"))
biopax$dt

addBiopaxInstances

This function adds new instances to an existing biopax model.

Description

This function adds new instances (supplied as a compatible data.table) to an existing biopax model via rbind. Usually you want to start out at createBiopax and addPhysicalEntity and work your way up the ontology ladder.

Usage

addBiopaxInstances(biopax, newInstancesDF)

Arguments

biopax A biopax model
newInstancesDF data.table or data.frame. Must be compatible with internal biopax implementation.

Value

Returns the supplied biopax model with the new instances added.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
biopax_temp = createBiopax(level=2)
biopax_temp = addBiopaxInstance(biopax_temp, class="protein", id="id1", properties=list(NAME="protein1",SYNONYMS="p1"))
selectInstances(biopax_temp)
biopax = addBiopaxInstances(biopax, selectInstances(biopax_temp))
addControl

This function adds a new control to the biopax model.

Description

This function adds a new interaction of class control to the biopax model. This is a convenience function to add controls, internally the function addBiopaxInstance is called with properties CONTROL-TYPE, CONTROLLER and CONTROLLED set.

Usage

```
addControl(biopax, CONTROL_TYPE = c("ACTIVATION", "INHIBITION"),
           CONTROLLER = "", CONTROLLED = c(), id = NULL)
```

Arguments

- `biopax`: A biopax model
- `CONTROL_TYPE`: string. Specifies whether this is an activating or inhibiting control.
- `CONTROLLER`: string. ID of the PhysicalEntityParticipant instance that is the controller of this interaction.
- `CONTROLLED`: vector of strings. IDs of the interaction and/or pathway instances that are being controlled.
- `id`: string. ID for the control. If NULL a new ID is generated with prefix "control".

Value

Returns the biopax model with the added pathway.

Author(s)

fkramer

Examples

```
biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id3", NAME="controllerProtein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id3", id="PEP_p_id3")
biopax = addControl(biopax, CONTROL_TYPE="ACTIVATION", CONTROLLER="PEP_p_id3", CONTROLLED="biochem_id_1", id="c_id1")
biopax$dt
```
addhash

Add a hash in front of a string

Description

Adds a hash in front of a string

Usage

addhash(x)

Arguments

x A string to be preceded by a hash

Value

The supplied string with a hash "#" pasted in front of it.

Author(s)

Frank Kramer

addns

Add a namespace tag to the supplied classname string

Description

This function takes the input classname, checks if it already has a namespace, and if not pastes the namespace tag with a dividing ":" in front of it.

Usage

addns(classname, namespace = "bp")

Arguments

classname A string containing a classname
namespace A string containing a namespace

Value

If the classname is not preceded by a namespace yet, the supplied namespace is pasted in front of it and returned.

Author(s)

Frank Kramer
addPathway

This function adds a new pathway to the biopax model.

Description

This function adds a new pathway + its PATHWAY-COMPONENTS (references to interaction/pathways/pathwaySteps)

Usage

addPathway(biopax, NAME, PATHWAY_COMPONENTS = c(), id = NULL,
ORGANISM = NULL, COMMENT = NULL)

Arguments

biopax A biopax model
NAME string. Name of the pathway
PATHWAY_COMPONENTS character vector. IDs of the pathway components. This must be IDs of instances of type interaction/pathway/pathwayStep (or their subclasses).
id string. ID for the pathway. If NULL a new ID is generated with prefix "pathway".
ORGANISM string. Organism property of the pathway. optional.
COMMENT string. An optional comment

Value

Returns the biopax model with the added pathway.

Author(s)

fkramer

Examples

biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id3", NAME="controllerProtein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id3", id="PEP_p_id3")
biopax = addControl(biopax, CONTROL_TYPE="ACTIVATION", CONTROLLER="PEP_p_id3", CONTROLLED="biochem_id_1", id="c_id1")
biopax = addPathway(biopax, NAME="mypathway1", PATHWAY_COMPONENTS=c("c_id1"), id="pw_id1")
biopax$dt
addPathwayComponents

This function adds pathway components to an existing pathway.

Description

This function adds pathway components to an existing pathway. Property PATHWAY-COMPONENTS are references to IDs of interaction/pathways/pathwaySteps (or subclasses of those).

Usage

addPathwayComponents(biopax, id, PATHWAY_COMPONENTS = c())

Arguments

biopax A biopax model
id string. ID for the pathway
PATHWAY_COMPONENTS character vector. IDs of the pathway components. This must be IDs of instances of type interaction/pathway/pathwayStep (or their subclasses).

Value

Returns the biopax model with the pathway components added to the pathway

Author(s)

fkramer

Examples

biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id_1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id3", NAME="controllerProtein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id3", id="PEP_p_id3")
biopax = addControl(biopax, CONTROL_TYPE="ACTIVATION", CONTROLLER="PEP_p_id3", CONTROLLED="biochem_id_1", id="c_id1")
biopax = addPathway(biopax, NAME="mypathway1", PATHWAY_COMPONENTS=c(), id="pw_id1")
biopax = addPathwayComponents(biopax, id="pw_id1", PATHWAY_COMPONENTS=c("c_id1"))
biopax$dt
addPhysicalEntity

This function adds a new physical entity.

Description

This function adds a new physical entity of chosen class to the biopax model. This is a convenience function to add physical entities, internally the function addBiopaxInstance is called with properties NAME and ORGANISM set.

Usage

addPhysicalEntity(biopax, class = c("dna", "rna", "protein", "smallMolecule", "complex")[[1]], NAME, id = NULL, ORGANISM = NULL, COMMENT = NULL)

Arguments

biopax A biopax model

class string. Class of the physical entity to add, choose from c("dna", "rna", "protein", "smallMolecule", "complex")

NAME string. Name of the new physical entity

id string. ID for the physical entity. If NULL a new ID is generated with prefix "physicalEntity".

ORGANISM string. Organism property of the molecule. optional.

COMMENT string. An optional comment

Value

Returns the biopax model with the added physical entity.

Author(s)

fkramer

Examples

biopax = createBiopax(level=2)
biopax = addBiopaxInstance(biopax, class="protein", id="id1", properties=list(NAME="protein1",COMMENT="this is my first protein!"))
biopax$dt
biopax = addPhysicalEntity(biopax, class="protein", id="id2", NAME="protein2", COMMENT="This is a protein added using the convenience function addPhysicalEntity")
biopax$dt
addPhysicalEntityParticipant

This function adds a new physical entity participant.

**Description**

This function adds a new physical entity participant instance, which is a placeholder for physicalEntity class instances in interactions. This is a convenience function to add physicalEntityParticipant instances, internally the function `addBiopaxInstance` is called.

**Usage**

```r
addPhysicalEntityParticipant(biopax, referencedPhysicalEntityID, id = NULL)
```

**Arguments**

- `biopax` A biopax model
- `referencedPhysicalEntityID` string. ID the new physicalEntity instance to reference here.
- `id` string. ID for the physical entity participant. If NULL a new ID is generated with prefix "physicalEntityParticipant".

**Value**

Returns the biopax model with the added physicalEntityParticipant.

**Author(s)**

fkramer

**Examples**

```r
biopax = createBiopax(level=2)
biopax = addPhysicalEntity(biopax, class="protein", id="p_id1", NAME="protein1")
biopax = addPhysicalEntityParticipant(biopax, "p_id1", id="PEP_p_id1")
biopax = addPhysicalEntity(biopax, class="protein", id="p_id2", NAME="protein2")
biopax = addPhysicalEntityParticipant(biopax, "p_id2", id="PEP_p_id2")
biopax = addBiochemicalReaction(biopax, LEFT=c("PEP_p_id1"), RIGHT=c("PEP_p_id2"), id="biochem_id1")
biopax$dt
```

addPropertiesToBiopaxInstance

This function adds new properties to an existing biopax instance.

**Description**

This function adds new properties to an existing biopax instance.

**Usage**

```r
addPropertiesToBiopaxInstance(biopax, id, properties)
```
Arguments

biopax  A biopax model
id    string. ID of the instance
properties  named list of properties.

Value

Returns the supplied biopax model with new properties added to this instance.

Author(s)

Frank Kramer

Examples

biopax = createBiopax(level=2)
biopax = addBiopaxInstance(biopax, class="protein", id="id1", properties=list(NAME="protein1",SYNONYMS="p1")
biopax$dt
biopax = addPropertiesToBiopaxInstance(biopax, id="id1", properties=list(COMMENT="this is my first protein!"
biopax$dt

biopax

Description

A dataset containing two regulatory pathways encoded in Biopax Level 2 and parsed in via readBiopax().

Another dataset containing pathways encoded in Biopax Level 2 and parsed in via readBiopax().

Format

An example biopax model parsed in via readBiopax.

Examples

data(biopaxexample)
biopax
data(biopaxLevel3Example)
biopax
calcGraphOverlap

**Description**

This function calculates the overlap of supplied graph1 with graph2. Layout and weights of graph1 are kept.

**Usage**

```r
calcGraphOverlap(graph1, graph2)
```

**Arguments**

- `graph1`: graphNEL
- `graph2`: graphNEL

**Value**

Returns a list containing the compared graphs and edge- and node-wise overlap between them.

**Author(s)**

Frank Kramer

**Examples**

```r
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)
calcGraphOverlap(mygraph1, mygraph2)
```

---

checkValidity

**Description**

This function checks the supplied biopax model for validity, concerning classes, properties, etc. Not yet implemented. Called internally by writeBiopax.

**Usage**

```r
checkValidity(biopax)
```

**Arguments**

- `biopax`: A biopax model
Value

logical. Returns TRUE if the biopax model is valid Biopax Level 2, or FALSE otherwise.

Author(s)

Frank Kramer

Description

Class inheritance relationships in Biopax Level 2.

Usage

CLASS_INHERITANCE_BP2

Format

A data frame with 46 rows and 2 columns

Details

A data.frame listing all direct superclasses for every Biopax Level 2 class. The variables are as follows:

- class. Name of the class
- superclass. Name of the superclass

Description

Class inheritance relationships in Biopax Level 3.

Usage

CLASS_INHERITANCE_BP3

Format

A data frame with 46 rows and 2 columns
Details

A data.frame listing all direct superclasses for every Biopax Level 3 class. The variables are as follows:

- class. Name of the class
- superclass. Name of the superclass

NOT UPDATED TO BP3 yet!

Description

Class properties in Biopax Level 2.

Usage

CLASS_PROPERTIES_BP2

Format

A data frame with 106 rows and 4 columns

Details

A data.frame listing all direct properties for every Biopax Level 2 class. Together with CLASS_INHERITANCE_BP2 this allows to list all properties, including the inherited ones, of every class.

The variables are as follows:

- class. Name of the class
- property. Name of the superclass
- property_type. Type of the property, value or reference
- cardinality. Maximum allowed cardinality of a property. Many properties may only be singular.
CLASS_PROPERTIES_BP3

**Description**

Class properties in Biopax Level 3.

**Usage**

CLASS_PROPERTIES_BP3

**Format**

A data frame with 106 rows and 4 columns

**Details**

A data frame listing all direct properties for every Biopax Level 3 class. Together with CLASS_INHERITANCE_BP3 this allows to list all properties, including the inherited ones, of every class.

The variables are as follows:

- class. Name of the class
- property. Name of the superclass
- property_type. Type of the property, value or reference
- cardinality. Maximum allowed cardinality of a property. Many properties may only be singular.

---

colorGraphNodes

*This function colors the nodes of a graph.*

**Description**

This function colors nodes of a graph, usually this is used to color subgraphs or add a color hue correlating with the expression level or fold change to the molecules.

**Usage**

colorGraphNodes(graph1, nodes, values, colors = c("greenred", "yellowred"))

**Arguments**

- graph1: graphNEL
- nodes: vector of node names specifying which nodes to color. must be same length as parameter foldChanges
- values: vector of values indicating fold changes, gene expression values or similar. colors are mapped linearly over the range of these values
- colors: string. either "greenred" or "yellowred", specifying which color gradient to use.
combineNodes

Value

Returns a graph with specified nodes colored according to the foldChanges.

Author(s)

Frank Kramer

Examples

```r
# load data and retrieve wnt pathway
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph1 = layoutRegulatoryGraph(mygraph1)
# retrieve all nodes
nodes = nodes(mygraph1)
# random expression data for your nodes
values = rnorm(length(nodes), mean=6, sd=2)
# color nodes of the graph
mygraph1 = colorGraphNodes(mygraph1, nodes, values, colors="greenred")
# plot the now colored graph
plotRegulatoryGraph(mygraph1, layoutGraph=FALSE)
```

Description

This function gracefully combines nodes of a regulatory graph. This is basically a wrapper for graph::combineNodes(nodes, graph, newName, collapseFunction=max). If there are duplicated edges for the nodes, the maximum edgeweight will be used for the new connection.

Usage

```r
combineNodes(nodes, graph, newName)
```

Arguments

- `nodes`: vector of node names specifying which nodes to combine.
- `graph`: graphNEL
- `newName`: string. Name of the newly created node that will combine the specified nodes.

Value

Returns a graph with specified nodes removed.

Author(s)

Frank Kramer

Examples

```r
# load data and retrieve wnt pathway
data(biopaxexample)
```
createBiopax  This function creates a new Biopax model from scratch

Description
This function creates a new Biopax model from scratch. This is not necessary if you want to parse a BioPAX export from a file, please see: readBiopax. Returns a biopax model, which is a list with named elements:

- **df** The data.frame representing the biopax in R
- **ns_rdf** RDF Namespace
- **ns_owl** OWL Namespace
- **ns_bp** Biopax Namespace
- **file** NULL

Usage
createBiopax(level = 3)

Arguments
- **level** integer. Specifies the BioPAX level.

Value
A biopax model

Author(s)
Frank Kramer

Examples
biopax = createBiopax(level=2)

DATABASE_BIOPAX

Description
Databases available for direct download via downloadBiopaxData

Usage
DATABASE_BIOPAX

Format
A data frame with 46 rows and 4 columns
Details
A data.frame listing all available databases which can be directly downloaded (Homo Sapiens only) via function downloadBiopaxData. The variables are as follows:

- database. Name of the database
- model. Name of the ontology model
- version. Biopax level
- link. Link to the direct download

\[ \text{diffGraphs} \quad \text{This function returns the different nodes and edges between graph1 and graph2.} \]

Description
This function returns the different nodes and edges between graph1 and graph2. Layout options of graph1 are kept. Coloring currently not implemented.

Usage
\[ \text{diffGraphs}(\text{graph1}, \text{graph2}, \text{colorNodes} = \text{TRUE}, \text{colors} = \text{c("#B3E2CD", 
"#FDCDAC")}) \]

Arguments
- graph1: graphNEL
- graph2: graphNEL
- colorNodes: logical
- colors: character vector of colors. If colorNodes==TRUE these colors are used for graph1 and graph2 respectively.

Value
Return the diff between the graphs.

Author(s)
Frank Kramer

Examples
\[ \text{# load data} \]
\[ \text{data(biopaxexample)} \]
\[ \text{pwid1 = "pid_p_100002_wntpathway"} \]
\[ \text{pwid2 = "pid_p_100146_hespathway"} \]
\[ \text{mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)} \]
\[ \text{mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)} \]
\[ \text{plotRegulatoryGraph(diffGraphs(mygraph1,mygraph2))} \]
Description

This function has an internal list of download links for some online databases. It will retrieve the selected model from the selected database using RCurl. The downloaded file is (if needed) unzipped and ready to be used as input for rBiopaxParser::readBiopax. This function requires package RCurl to run. You can easily skip this step by downloading the exported file yourself and continuing with readBiopax.

Usage

downloadBiopaxData(database = "NCI", model = c("pid", "biocarta", "reactome", "kegg"), outputfile = "", version = "biopax2")

Arguments

database | string. Select which database you want to download from. Currently only NCI links have been stored.

model | string. Select which model/file you want to download. Currently NCI versions of the Pathway Interaction Database, Biocarta, Reactome and KEGG are linked.

outputfile | string. The file name to save the downloaded data in. If left empty the URL file name will be used. The unzipped file name can be different from this. Check the screen output of gunzip.

version | string. Select which Biopax Version you want to download.

Value

none. Check output for the name of the unzipped biopax .owl file.

Author(s)

fkramer

Examples

## Not run: file = downloadBiopaxData("NCI", "biocarta", version = "biopax2")
## Not run: biopax = readBiopax(file)
## Not run: biopax
**generateNewUniqueID**

This function generates a new unique id for a biopax model.

**Description**

This function generates a new unique id for a biopax model. Pass it an starting point like "pathway" or "protein" to get a nicer looking id.

**Usage**

```r
generateNewUniqueID(biopax, id = "")
```

**Arguments**

- `biopax`: A biopax model
- `id`: string. This is used as a prefix for the id.

**Value**

Returns an unused unique ID.

**Author(s)**

fkramer

---

**getClassProperties**

This function returns the properties of the supplied biopax class.

**Description**

This function returns the properties of the supplied biopax class. It always considers inheritance. Every class inherits the properties of its super classes. A table listing all available properties and their cardinalities (for Biopax Level 2).

**Usage**

```r
getClassProperties(classname, biopaxlevel = 3)
```

**Arguments**

- `classname`: A string containing a class name
- `biopaxlevel`: Numeric. Specifies the Biopax Level to use.

**Value**

Returns a data.frame containing the properties and cardinalities of the supplied class.

**Author(s)**

Frank Kramer
getInstanceProperty

**Examples**

```
getInstanceProperty("control")
```

---

**getInstanceClass**  
*This function returns the class name of the instance.*

**Description**

This function returns the class name of the instance.

**Usage**

```
getInstanceClass(biopax, id)
```

**Arguments**

- **biopax**  
  A biopax model
- **id**  
  string

**Value**

Returns the class name of the biopax instance.

**Author(s)**

fkramer

**Examples**

```
# load data
data(biopaxexample)
getInstanceClass(biopax, id="ex_m_100650")
```

---

**getInstanceProperty**  
*This function returns all properties of the specified type for an instance.*

**Description**

This function returns all properties of the specified type for an instance. By default this function returns the NAME property of an instance.

**Usage**

```
getInstanceProperty(biopax, id, property = "NAME", includeAllNames = TRUE, biopaxlevel = 3)
```
getNeighborhood

Arguments

- **biopax** A biopax model
- **id** string
- **property** string.
- **includeAllNames** logical. Biopax Level 3 brought 2 new name properties: displayName and standardName. Per default this return all names of an instance. Disable if you only want the NAME property.
- **biopaxlevel** integer. Set the biopax level here if you supply a data.table directly.

Value

Returns a character vector with all properties of the selected type for this instance. Returns NULL if no property data is found.

Author(s)

fkramer

Examples

```r
# load data
data(biopaxexample)
getInstanceProperty(biopax, id="ex_m_100650", property="NAME")
getInstanceProperty(biopax, id="ex_m_100650", property="ORGANISM")
getInstanceProperty(biopax, id="ex_m_100650", property="COMPONENTS")
```

getNeighborhood

This function returns the neighborhood of a physicalEntity

Description

This function searches the supplied biopax for interactions that are connected to the molecule or within 'depth' number of steps from it.

Usage

```r
getNeighborhood(biopax, id, depth = 1, onlyInPathways = c(),
biopaxlevel = 3)
```

Arguments

- **biopax** A biopax model
- **id** string. ID of a physicalEntity (dna, rna, protein, complex, smallMolecule)
- **depth** integer. Search depth, this specifies how far out from the specified molecule the neighborhood should be stretched.
- **onlyInPathways** character vector of pathway IDs. Search only in these pathways for neighbors.
- **biopaxlevel** integer. Set the biopax level here if you supply a data.table directly.
getParticipants

Value

Returns ids of interactions within 'depth' number of steps of the specified physicalEntity

Author(s)

fkramer

getParticipants  This function is used internally by pathway2Graph to obtain physical entities participating in an interaction.

Description

This function is used internally by pathway2Graph to obtain physical entities participating in an interaction.

Usage

getParticipants(pwComponentList, instance, biopaxlevel, splitComplexMolecules = FALSE, useIDasNodenames = TRUE)

Arguments

pwComponentList  List of pathway components
instance  Biopax instance id
biopaxlevel  integer. Set the biopax level here if you supply a data.table directly.

splitComplexMolecules  logical. If TRUE complexes are split up into their components and the annotation of the components is added.
useIDasNodenames  logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.

Author(s)

Nirupama Benis
**getReferencedIDs**

This function returns a vector of ids of all instances referenced by the specified instance.

---

**Description**

This function takes an id and a biopax model as input. The id of every instance that is referenced is returned. If recursive == TRUE this function recurses through all referenced IDs of the referenced instances and so on. "onlyFollowProperties" limits the recursivness to only certain properties, for example follow only complexes or physicalEntities.

**Usage**

```r
getReferencedIDs(biopax, id, recursive = TRUE, onlyFollowProperties = c())
```

**Arguments**

- `biopax`: A biopax model OR a compatible data.table
- `id`: string. ID of the instance
- `recursive`: logical
- `onlyFollowProperties`: character vector

**Value**

Returns a character vector of IDs referenced by the supplied id in the supplied biopax model.

**Author(s)**

Frank Kramer

**Examples**

```r
# load data
data(biopaxexample)
listComplexComponents(biopax, id="ex_m_100650")
getReferencedIDs(biopax, id="ex_m_100650", recursive=FALSE)
getReferencedIDs(biopax, id="ex_m_100650", recursive=TRUE)
```

---

**getReferencingIDs**

This function returns a vector of ids of all instances that reference the supplied id.

---

**Description**

This function takes an id and a biopax model as input. The id of every instance that references the supplied id is returned. If recursive == TRUE this function recurses through all referencing IDs of the referencing instances and so on. "onlyFollowProperties" limits the recursivness to only certain properties, for example follow only complexes or physicalEntities.
**Usage**

getReferencingIDs(biopax, id, recursive = TRUE, onlyFollowProperties = c())

**Arguments**

- **biopax**: A biopax model
- **id**: string. ID of the instance
- **recursive**: logical
- **onlyFollowProperties**: character vector

**Value**

Returns a character vector of IDs referencing the supplied id in the supplied biopax model.

**Author(s)**

Frank Kramer

**Examples**

```r
# load data
data(biopaxexample)
listComplexComponents(biopax, id="ex_m_100650")
getReferencingIDs(biopax, id="ex_m_100650", recursive=FALSE)
getReferencingIDs(biopax, id="ex_m_100650", recursive=TRUE)
```

---

**getSubClasses**

This function returns the subclasses of the supplied biopax class.

**Description**

This function returns the subclasses of the supplied biopax class.

**Usage**

getSubClasses(classname, biopaxlevel = 3)

**Arguments**

- **classname**: A string containing a class name
- **biopaxlevel**: Numeric. Specifies the Biopax Level to use.

**Value**

Returns character vector containing the subclasses of the supplied class.

**Author(s)**

Frank Kramer
**getSuperClasses**

Examples

getSubClasses("control")

---

getSuperClasses  
*This function returns the superclasses of the supplied biopax class.*

**Description**

This function returns the superclasses of the supplied biopax class.

**Usage**

getSuperClasses(classname, biopaxlevel = 3)

**Arguments**

- **classname**  
  A string containing a class name
- **biopaxlevel**  
  Numeric. Specifies the Biopax Level to use.

**Value**

Returns character vector containing the superclasses of the supplied class

**Author(s)**

Frank Kramer

**Examples**

getSuperClasses("control")

---

getXrefAnnotations  
*This function returns the annotations of the supplied instances.*

**Description**

This function returns the annotations of the supplied IDs in a data.table.

**Usage**

getXrefAnnotations(biopax, id, splitComplexes = FALSE,  
followPhysicalEntityParticipants = TRUE, biopaxlevel = 3)
Arguments

biopax: A biopax model
id: vector of strings. IDs of instances to get annotations
splitComplexes: logical. If TRUE complexes are split up into their components and the annotation of the components is added.
followPhysicalEntityParticipants: logical. If TRUE physicalEntityParticipants are resolved to their corresponding physicalEntities and their annotation is added.
biopaxlevel: integer. Set the biopax level here if you supply a data.table directly.

Value

Returns data.table with annotations

Author(s)

fkramer

Examples

# load data
data(biopaxexample)
# example of annotation for a protein:
getXrefAnnotations(biopax, id="ex_m_100647")
# no annotations for exactly the complex
getXrefAnnotations(biopax, id="ex_m_100650")
# split up the complex and get annotations for all the molecules involved
getXrefAnnotations(biopax, id="ex_m_100650", splitComplexes=TRUE)

hasProperty

Checks if instances in the biopax data.table have a given property

Description

Checks if instances in the biopax data.table have a given property

Usage

hasProperty(df, property)

Arguments

df: A data.frame with biopax instances
property: A string containing the name of the property to check for

Value

Returns TRUE for every row in the data.frame with contains the supplied property. Logical vector with length corresponding to the number of rows in the data.frame.

Author(s)

Frank Kramer
internal_checkArguments

This function checks the supplied arguments if they abid to the given restrictions

Description

This function checks the supplied arguments if they abid to the given restrictions

Usage

internal_checkArguments(args = c(), allowedValues = list(),
allowNULL = FALSE, allowNA = FALSE, allowEmptyString = TRUE,
allowInf = TRUE)

Arguments

<table>
<thead>
<tr>
<th>arg</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>args</td>
<td>The vector of arguments to check</td>
</tr>
<tr>
<td>allowedValues</td>
<td>A named list of values the argument of a this name is allowed to have</td>
</tr>
<tr>
<td>allowNULL</td>
<td>Logical, allow NULL or not</td>
</tr>
<tr>
<td>allowNA</td>
<td>Logical, allow NA or not</td>
</tr>
<tr>
<td>allowEmptyString</td>
<td>Logical, allow empty strings or not</td>
</tr>
<tr>
<td>allowInf</td>
<td>Logical, allow values of +/- infinity or not</td>
</tr>
</tbody>
</table>

Value

Returns 1 if all checks completed successfully, returns error message otherwise.

Author(s)

Frank Kramer

internal_generateXMLfromBiopax

This function generates the xmlTree from the supplied biopax model.

Description

This function is used internally by writeBiopax. It can also be called directly with a fitting dataframe in list(df=data.frame()), but this will probably break things.

Usage

internal_generateXMLfromBiopax(biopax, namespaces = namespaces,
verbose = TRUE)
internal_getBiopaxModelAsDataFrame

Arguments

biopax A biopax model
namespaces A list of namespaces to use for the generated XML/RDF file
verbose logical

Value

Returns the xmlTree generated from the supplied biopax model.

Author(s)

Frank Kramer

Description

This internal function parses the Biopax XML of the supplied biopax model and returns it in the data.frame format.

Usage

internal_getBiopaxModelAsDataFrame(biopax, biopaxxml, verbose = TRUE)

Arguments

biopax A biopax object
biopaxxml Biopax XML file read in. See parseBiopax
verbose logical

Value

Returns the parsed biopax model in the internal data.frame format.

Author(s)

Frank Kramer
internal_NrOfXMLNodes

This function is an internal function to count the Number of nodes and child nodes of an XMLNode.

Description

This function is an internal function to count the Number of nodes and child nodes of an XMLNode.

Usage

internal_NrOfXMLNodes(myXMLNode)

Arguments

myXMLNode   XMLNode to analyze

Value

This function returns the number of Nodes and child Nodes an XMLNode has.

Author(s)

Frank Kramer

internal_propertyListToDF

Internal function to build a data.frame from the list of properties for a new instance

Description

Internal function to build a data.frame from the list of properties for a new instance

Usage

internal_propertyListToDF(class, id, properties, namespace_rdf = "rdf", biopaxlevel = 2)

Arguments

class    string. Class name
id       string. ID of the instance
properties  named list of properties.
namespace_rdf  string. This defines the rdf namespace to use.
biopaxlevel  integer. This sets the version of BioPAX to generate, level 2 and level 3 are supported at the moment.

Value

Returns a data.frame with the new properties for the given instance
internal_resolvePhysicalEntityParticipant

This function resolves physicalEntityParticipantIDs to their corresponding physicalEntityIDs.

**Description**
This function resolves physicalEntityParticipantIDs to their corresponding physicalEntityIDs. Every physicalEntityParticipant corresponds exactly to one physicalEntity.

**Usage**
internal_resolvePhysicalEntityParticipant(biopax, physicalEntityId)

**Arguments**
- biopax: A biopax model
- physicalEntityId: string. IDs of physicalEntityParticipants to be resolved

**Value**
Returns ids of physicalEntity corresponding to the specified physicalEntityParticipantIDs

**Author(s)**
fkramer

---

internal_XMLInstance2DF

This function is an internal function that parses a Biopax XMLNode.

**Description**
This function is an internal function that parses a Biopax XMLNode. Do not call it manually.

**Usage**
internal_XMLInstance2DF(myXMLNode, namespace_rdf, ret, rowcount)

**Arguments**
- myXMLNode: XMLNode
- namespace_rdf: String specifying the namespace to use for rdf:resource and rdf:datatype
- ret: data.table object containing the already parsed data to attach this instance to
- rowcount: Numeric specifying the row at which further parsed data is inserted into the data.table
intersectGraphs

Value

Returns a list containing the new rowcount and the instance id of the added instance.

Author(s)

Frank Kramer

intersectGraphs  This function returns a graph computed by the intersection of supplied graph1 and graph2.

Description

This function returns a graph computed by the intersection of supplied graph1 and graph2. Layout and weights of graph1 are kept.

Usage

intersectGraphs(graph1, graph2)

Arguments

graph1  graphNEL
graph2  graphNEL

Value

Returns the intersection of graph1 and graph2.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)
plotRegulatoryGraph(intersectGraphs(mygraph1,mygraph2))
isOfClass

**Checks if instances in the biopax data.table are of the given class**

**Description**
This function checks if instances in the supplied biopax data.table are of a given class. If considerInheritance is set to TRUE it also checks if instances are of a given class or any of its inherited classes.

**Usage**

```r
isOfClass(df, class, considerInheritance = FALSE, biopaxlevel = 2)
```

**Arguments**
- `df`: A data.frame with biopax instances
- `class`: A string containing the class name to check for
- `considerInheritance`: Logical value indicating whether to consider inheritance or not
- `biopaxlevel`: Numeric. Specifies the Biopax Level to use.

**Value**
Returns TRUE for every row in the data.frame which is of the supplied class

**Author(s)**
Frank Kramer

isOfNamespace

**Check if a classname is preceeded by a certain namespace tag like in "namespace:classname"**

**Description**
This function checks if the supplied input string starts with a supplied namespace tag

**Usage**

```r
isOfNamespace(classname, namespace = "bp")
```

**Arguments**
- `classname`: A string containing the classname to check
- `namespace`: A string giving the namespace to check for

**Value**
This function returns TRUE if the supplied classname string is preceeded with the supplied namespace string, and FALSE if not.
isURL

Check if a string is an URL, preceded by "http:"

Description

This function checks if the supplied input string starts with "http:"

Usage

isURL(string)

Arguments

string A string containing the classname to check

Value

This function returns TRUE if the supplied classname string starts with "http:", and FALSE if not.

Author(s)

Frank Kramer

layoutRegulatoryGraph

This function generates a (more or less) beautiful layout for a regulatory graph.

Description

This function generates a (more or less) beautiful layout for a regulatory graph. Call this after you generated a graph with pathway2RegulatoryGraph. Since beauty is always in the eye of the beholder consider this a starting point for making your graphs even nicer. Rgraphviz with dot layout is used. Edges are green/red with normal/tee arrowheads for activations/inhibitions. If you want to specifically paint subgraphs in different colors use lists of vectors with node names for parameter subgraphs and vector of color names for subgraphs.color for your choice of color. The output can be further tweaked by setting layout options using nodeRenderInfo(mygraph) <- list(...) ... See the Rgraphviz and Graphviz documentations.

Usage

layoutRegulatoryGraph(mygraph, label = "", node.fixedsize = FALSE, edge.weights = c("green", "black", "red"), edge.arrowheads = c("normal", "tee"), subgraphs = list(), subgraphs.colors = c("#B3E2CD", "#FDCDAC", "#F4CAE4", "#E6F5C9", "#FFF2AE"))
listComplexComponents

Arguments
mygraph graphNEL
label Label of the graph
node.fixedsize logical. If font size is fixed or variable in regards to the nodes.
edge.weights vector. which colors to use for weighted edges
edge.arrowheads vector. which arrowheads to use for weighted edges
subgraphs A list of character vectors with node names defining the sub graphs.
subgraphs.colors vector. which colors to use for subgraphs

Value
Returns the supplied graph in a laid out form with several parameters set for regulatory graph plotting.

Author(s)
Frank Kramer

Description
This function lists all components of a given complex.

Usage
listComplexComponents(biopax, id, returnIDonly = FALSE, biopaxlevel = 3)

Arguments
biopax A biopax model
id string. A complex ID
returnIDonly logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
biopaxlevel integer. Set the biopax level here if you supply a data.table directly.

Value
data.frame

Author(s)
Frank Kramer
Examples

```r
# load data
data(biopaxexample)
listComplexComponents(biopax, id="ex_m_100650")
```

### listInstances

Lists all instances that conform to the selection criteria. In contrast to `selectInstances` this function returns an easier to read list. This function returns an ordered `data.table` of class, id and name of the instances. Selection criteria are whether instances belong to a certain class or have the specified id or name. Setting a criteria to NULL ignores this criteria. If `includeSubClasses` is set to TRUE the class criteria is broadened to include all classes that inherit from the given class, e.g. if class="control" and `includeSubClasses=TRUE` the function will select catalyses and modulations too, since they are a subclass of class control.

#### Usage

```r
listInstances(biopax, id = NULL, class = NULL, name = NULL,
             includeSubClasses = FALSE, returnIDonly = FALSE, biopaxlevel = 3)
```

#### Arguments

- **biopax**: A biopax model
- **id**: string. ID of the instances to select
- **class**: string. Class of the instances to select
- **name**: string. Name of the instances to select
- **includeSubClasses**: logical. If `includeSubClasses` is set to TRUE the class criteria is broadened to include all classes that inherit from the given class
- **returnIDonly**: logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
- **biopaxlevel**: integer. Set the biopax level here if you supply a `data.table` directly.

#### Value

Returns a `data.frame` containing all instances conforming to the given selection criteria. If `returnIDonly=TRUE`, only the selector for the internal `data.table` otherwise.

#### Author(s)

Frank Kramer
listInteractionComponents

This function lists all components of a given interaction.

Description

This function returns a (unique) data.frame listing IDs, names and classes of all components of the supplied interaction.

Usage

listInteractionComponents(biopax, id, splitComplexes = TRUE, returnIDonly = FALSE, biopaxlevel = 3)

Arguments

- biopax: A biopax model
- id: string. A complex ID
- splitComplexes: logical. If TRUE complexes are split up into their components and the added to the listing.
- returnIDonly: logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
- biopaxlevel: integer. Set the biopax level here if you supply a data.table directly.

Value

data.frame

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
listInteractionComponents(biopax, id="ex_i_100036_activator_1")
listPathwayComponents

This function lists all pathway components of a given pathway.

Description

This function returns a (unique) data.frame listing all component IDs, names and classes of the supplied pathway.

Usage

listPathwayComponents(biopax, id, includeSubPathways = TRUE, returnIDonly = FALSE, biopaxlevel = 3)

Arguments

biopax A biopax model
id string. A pathway ID
includeSubPathways logical. If TRUE the returned list will include subpathways and pathwaysteps as well.
returnIDonly logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
biopaxlevel integer. Set the biopax level here if you supply a data.table directly.

Value
data.frame

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
listPathwayComponents(biopax, id="pid_p_100002_wntpathway")

listPathways

This function returns a list of all pathway ids.

Description

This function returns a vector of all pathway ids.

Usage

listPathways(biopax, biopaxlevel = 3)
mergePathways

Arguments

biopax A biopax model
biopaxlevel integer. Set the biopax level here if you supply a data.table directly.

Value

Returns a character vector containing the names of all pathways.

Author(s)

Frank Kramer

Examples

# load data
data(biopaxexample)
listPathways(biopax)

mergePathways This function merges two given pathways

Description

This function merges two given pathways and appends it to the supplied biopax model. The user has to specify a new name for the pathways and can supply ID, ORGANISM and COMMENT properties for the new pathway. If no ID is supplied, a new unique ID is generated. If no organism property is supplied the organism property of the first pathway is re-used. If ORGANISM is NULL the property is not set. Optionally a comment can be added to the pathway.

Usage

mergePathways(biopax, pwid1, pwid2, NAME, id = NULL, ORGANISM = "", COMMENT = NULL)

Arguments

biopax A biopax model
pwid1 string. ID of first pathway to merge
pwid2 string. ID of second pathway to merge
NAME string. Name of the new merged pathway
id string. ID for the pathway. If NULL a new ID is generated with prefix "pathway".
ORGANISM string. Organism property of the pathway. By default uses the same organism as the first supplied pathway. If NULL no organism property is set.
COMMENT string. An optional comment

Value

A biopax model with the merged pathway added.
This function generates an adjacency matrix from the activations/inhibitions of a pathway in a biopax model. This function internally first calls pathway2RegulatoryGraph, then converts the regulatory graph to an adjacency matrix. See pathway2RegulatoryGraph for more details.

Description

This function generates an adjacency matrix from the activations/inhibitions of a pathway in a biopax model. This function internally first calls pathway2RegulatoryGraph, then converts the regulatory graph to an adjacency matrix. See pathway2RegulatoryGraph for more details.

Usage

pathway2AdjacencyMatrix(biopax, pwid, expandSubpathways = TRUE, splitComplexMolecules = TRUE, useIDasNodenames = FALSE, verbose = TRUE)

Arguments

biopax A biopax model
pwid string
expandSubpathways logical. If TRUE subpathways are expanded into this graph, otherwise only this very pathway is used.
splitComplexMolecules logical. If TRUE every complex is split up into its components. This leads to splitting a single node with name of the complex into several nodes with names of the components, these components all have identical edges.
useIDasNodenames logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.
verbose logical

Value

Returns the adjacency matrix representing the regulatory graph of the supplied pathway.

Author(s)

Frank Kramer
Examples

```r
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
pathway2AdjacancyMatrix(biopax, pwid1)
```

This function generates the gene set of a pathway. This function generates a gene set of all physicalEntity’s of a pathway. First all interactions of the pathway are retrieved and all components of these interactions are then listed.

Description

This function generates the gene set of a pathway.

Usage

```r
pathway2Geneset(biopax, pwid, returnIDonly = FALSE, biopaxlevel = 3)
```

Arguments

- `biopax` A biopax model
- `pwid` string
- `returnIDonly` logical. If TRUE only IDs of the components are returned. This saves time for looking up names for every single ID.
- `biopaxlevel` integer. Set the biopax level here if you supply a data.table directly.

Value

Returns the gene set of the supplied pathway. Returns NULL if the pathway has no components.

Author(s)

Frank Kramer

Examples

```r
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pathway2Geneset(biopax, pwid=pwid1)
```
pathway2Graph  

This function generates a directed graph from all the interactions of a specified pathway in a biopax model. Edges with no direction are indicated by a 0 weight.

Description

This function generates a directed graph from all the interactions of a specified pathway in a biopax model. Edges with no direction are indicated by a 0 weight.

Usage

pathway2Graph(biopax, pwid, expandSubpathways = TRUE, splitComplexMolecules = FALSE, useIDsNodenames = TRUE, verbose = FALSE, withDisconnectedParts = TRUE)

Arguments

biopax  
A biopax model

pwid  
string

expandSubpathways  
logical. If TRUE subpathways are expanded into this graph, otherwise only this very pathway is used.

splitComplexMolecules  
logical. If TRUE every complex is split up into its components. This leads to splitting a single node with name of the complex into several nodes with names of the components, these components all have identical edges. Default value is FALSE

useIDsNodenames  
logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.

verbose  
logical

withDisconnectedParts  
logical. If TRUE the pathway graph is returned as such, else only the largest connected component is given back

Value

Returns the a graph object of the specified pathway. Edges with no direction are indicated by a 0 weight.

Author(s)

Nirupama Benis
Examples

# load data
data(biopaxLevel3Example)  # location of the data
pwid <- "Pathway1019"
# build pathway using pathway2Graph
pathwayAsGraph <- pathway2Graph(biopax = biopaxLevel3Example, pwid = pwid, splitComplexMolecules = FALSE, useIDasNodenames = TRUE, verbose = FALSE, withDisconnectedParts = TRUE)
pathwayAsGraph  # should have 23 nodes, 24 edges
plotRegulatoryGraph(pathwayAsGraph)
# build pathway discarding the disconnected parts of the graph
pathwayAsGraph <- pathway2Graph(biopax = biopaxLevel3Example, pwid = pwid, splitComplexMolecules = FALSE, useIDasNodenames = TRUE, verbose = FALSE, withDisconnectedParts = FALSE)
pathwayAsGraph  # should have 10 nodes, 11 edges
plotRegulatoryGraph(pathwayAsGraph)

Description

This function generates the regulatory graph from the activations/inhibitions of a pathway in a biopax model. This functions builds a graph from the pathway components of the supplied pathway. Only instances of class 'control' are considered, this leads a functional graph with all edges either representing activations or inhibitions. No transports, no translocation, etc. If desired complexes can be split up into several nodes, this can sometimes lead to a more complex and cluttered graph. There can not be multiple edges between 2 nodes. Whenever duplicated edges are generated (especially by splitting up complexes) a warning is thrown.

Usage

pathway2RegulatoryGraph(biopax, pwid, expandSubpathways = TRUE,
                        splitComplexMolecules = TRUE, useIDasNodenames = FALSE, verbose = TRUE)

Arguments

biopax A biopax model
pwid string
expandSubpathways logical. If TRUE subpathways are expanded into this graph, otherwise only this very pathway is used.
plotRegulatoryGraph

splitComplexMolecules
logical. If TRUE every complex is split up into its components. This leads to splitting a single node with name of the complex into several nodes with names of the components, these components all have identical edges.

useIDasNodenames
logical. If TRUE nodes of the graph are named by their molecule IDs instead of using the NAME property. This can help with badly annotated/formatted databases.

verbose
logical

Value
Returns the representing the regulatory graph of the supplied pathway in a node-edge-list graph.

Author(s)
Frank Kramer

Examples

```r
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
plotRegulatoryGraph(mygraph)
```

plotRegulatoryGraph This function layouts a regulatory graph and plots it using Rgraphviz.

Description
This function takes a regulatory graph as generated by pathway2regulatoryGraph and plots it using standard layout options of layoutRegulatoryGraph. This function is a wrapper for layoutRegulatoryGraph with standard parameters. Subgraphs can be painted with different colors. This can be done by passing parameter subgraph a list of character vectors with node names.

Usage

```r
plotRegulatoryGraph(mygraph, subgraphs = list(), layoutGraph = TRUE)
```

Arguments

- `mygraph` graphNEL, regulatory graph
- `subgraphs` list of character vectors with node names
- `layoutGraph` logical. If FALSE the graph is not laid out again but send directly to Rgraphviz::renderGraph.

Value
none
Author(s)

Frank Kramer

Examples

```r
# load data
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph = pathway2RegulatoryGraph(biopax, pwid1)
plotRegulatoryGraph(mygraph)
```

---

**print.biopax**

*Print a biopax object.*

---

**Description**

Print a biopax object.

**Usage**

```r
## S3 method for class 'biopax'
print(x, ...)
```

**Arguments**

- `x` A biopax object to print.
- `...` Other arguments to be passed to `print`.

**Examples**

```r
data(biopaxexample)
print(biopax)
```

---

**readBiopax**

*This function reads in a Biopax .owl file*

---

**Description**

This function reads in a Biopax .owl file and generates the internal data.frame format used in this package. This function can take a while with really big Biopax files like NCIs Pathway Interaction Database or Reactome. In almost every case this is your starting point. Returns a biopax model, which is a list with named elements:

- `df` The data.frame representing the biopax in R
- `ns_rdf` RDF Namespace
- `ns_owl` OWL Namespace
- `ns_bp` Biopax Namespace
- `file` File name
**Usage**

```r
readBiopax(file, verbose = TRUE)
```

**Arguments**

- `file` string. File name
- `verbose` logical. Output messages about how parsing is going and so on.

**Value**

A biopax model

**Author(s)**

Frank Kramer

**Examples**

```r
## Not run: biopax = readBiopax(file="biopaxmodel.owl")
## Not run: biopax
```

---

**removeDisconnectedParts**

*This function is used internally by pathway2Graph to remove the smaller disconnected parts of the pathway graph.*

**Description**

This function is used internally by pathway2Graph to remove the smaller disconnected parts of the pathway graph.

**Usage**

```r
removeDisconnectedParts(mygraph)
```

**Arguments**

- `mygraph` a graph object

**Author(s)**

Nirupama Benis
removeInstance

This function removes an instance from an existing biopax model.

Usage

removeInstance(biopax, id)

Arguments

biopax A biopax model
id string. ID of the instance

Value

Returns the supplied biopax model with the instance removed from it.

Author(s)

Frank Kramer

removeNodes

This function gracefully removes nodes from a regulatory graph.

Description

This function gracefully removes nodes from a regulatory graph. If the node to be removed has both parent and child nodes, these are connected directly. The weight of the new direct edge is the product of multiplying the incoming and outgoing edge weights of the original node.

Usage

removeNodes(graph, nodes)

Arguments

graph graphNEL
nodes vector of node names specifying which nodes to remove.

Value

Returns a graph with specified nodes removed.

Author(s)

Frank Kramer
Examples

```r
# load data and retrieve wnt pathway
data(biopaxexample)
pwid1 = "pid_p_100002_wntpathway"
mypgraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mypgraph1 = layoutRegulatoryGraph(mypgraph1)
# retrieve all nodes
nodes = nodes(mypgraph1)
# random expression data for your nodes
values = rnorm(length(nodes), mean=6, sd=2)
# color nodes of the graph
mypgraph1 = colorGraphNodes(mypgraph1, nodes, values, colors="greenred")
# plot the now colored graph
plotRegulatoryGraph(mypgraph1, layoutGraph=FALSE)
```

---

removeProperties  
This function removes a property

Description

This function removes a property fram an existing biopax instance.

Usage

```r
removeProperties(biopax, id, properties)
```

Arguments

- `biopax` A biopax model
- `id` string. ID of the instance
- `properties` character vector. listing the properties to remove.

Value

Returns the supplied biopax model with properties removed from this instance.

Author(s)

Frank Kramer
selectInstances  

Returns all instances that conform to the selection criteria.

Description

Returns all instances that conform to the selection criteria. This function returns a subset of the internal data.table of the biopax object. Selection criteria are whether instances belong to a certain class or have the specified id, property or name. Setting a criteria to NULL ignores this criteria. If returnValues is set to FALSE only the selector (a logical vector with length of the internal data.table) is returned, otherwise the selected data is returned. If includeSubClasses is set to TRUE the class criteria is broadened to include all classes that inherit from the given class, e.g. if class="control" and includeSubClasses=TRUE the function will select catalyses and modulations too, since they are a subclass of class control. If includeReferencedInstances is set to TRUE all instances that are being referenced by the selected instances are being selected too. The parameter works recursively, this means for example that a selected pathway and all its interactions, complexes, molecules and annotations are returned if this parameter is set to true. This parameter is especially helpful if you want to migrate or merge knowledge from different data bases.

Usage

selectInstances(biopax, id = NULL, class = NULL, property = NULL, name = NULL, returnValues = TRUE, includeSubClasses = FALSE, includeReferencedInstances = FALSE, returnCopy = TRUE, biopaxlevel = 3)

Arguments

biopax  
A biopax model or a compatible internal data.table

id  
string. ID of the instances to select

class  
string. Class of the instances to select

property  
string. Return only this property of the instances

name  
string. Name of the instances to select

returnValues  
logical. If returnValues is set to FALSE only the selector (a logical vector with length of the internal data.table) is returned, otherwise the selected data is returned

includeSubClasses  
logical. If includeSubClasses is set to TRUE the class criteria is broadened to include all classes that inherit from the given class

includeReferencedInstances  
logical. If includeReferencedInstances is set to TRUE all instances that are being referenced by the selected instances are being selected too

returnCopy  
logical. Defaults to TRUE. If TRUE a copy of the internal data.table is returned. If FALSE data is returned by reference. Set to FALSE to increase speed when only ever reading data. Make sure you understand the implications of using this! See vignette of data.table package.

biopaxlevel  
integer. Set the biopax level here if you supply a data.table directly.

Value

Returns a data.table containing all instances conforming to the given selection criteria if returnValues=TRUE, only the selector for the internal data.table otherwise.
splitComplex

Author(s)
Frank Kramer

Examples

# load data
data(biopaxexample)

# select the subset of the internal data.table that belongs to class "protein"
selectInstances(biopax, class="protein")

# select the subset of the internal data.table that belongs to class "interaction"
selectInstances(biopax, class="interaction")

# select the subset of the internal data.table that belongs to class "interaction" or any of its sub classes, like control, catalysis etc.
selectInstances(biopax, class="interaction", includeSubClasses=TRUE)

# select the subset of the internal data.table that belongs to class "pathway" AND is a "NAME" property
selectInstances(biopax, class="pathway", property="NAME")

splitComplex  This functions splits up a complex into its components.

Description
This function looks up the supplied Complex ID and returns the names of all its components.

Usage

splitComplex(biopax, complexid, recursive = TRUE, returnIDonly = FALSE, biopaxlevel = 3)

Arguments

biopax      A biopax model
complexid   string ID of an complex
recursive   logical
returnIDonly logical. If TRUE only IDs of the components are returned. This saves tiem for looking up names for every single ID.
biopaxlevel integer. Set the biopax level here if you supply a data.table directly.

Value
Returns a character vector with the names of all subcomponents.

Author(s)
Frank Kramer

Examples

# load data
data(biopaxexample)

selectInstances(biopax, id="ex_m_100650")
listInstances(biopax, id="ex_m_100650")
listComplexComponents(biopax, id="ex_m_100650")

splitComplex(biopax, complexid="ex_m_100650")
stripns

Strips a namespace tag off a supplied classname string

Description
 strips a namespace tag off a supplied classname string

Usage
 stripns(classname)

Arguments
 classname A string containing a classname preceded by a namespace tag

Value
 The classname with the namespace tag stripped off it.

Author(s)
 Frank Kramer

stripns
 Strips a hash in front of a string

Description
 strips a hash in front of a string

Usage
 striphash(x)

Arguments
 x A string to be stripped off a preceding hash

Value
 The supplied string with a hash "#" stripped off front.

Author(s)
 Frank Kramer
transitiveClosure

This function generates the transitive closure of the supplied graph.

Description

This function generates the transitive closure of the supplied graph. In short: if A->B->C then an edge A->C is added. Edge weights are conserved if possible (in a hopefully smart way). This is a simple convenience wrapper for the RBGL function transitive.closure.

Usage

transitiveClosure(mygraph)

Arguments

mygraph graphNEL

Value

Returns the transitive closure of the supplied graph.

Author(s)

Frank Kramer

transitiveReduction

This function generates the transitive reduction of the supplied graph.

Description

This function generates the transitive reduction of the supplied graph. In short: if A->B->C AND A->C then edge A->C is removed. This is a simple convenience wrapper for the NEM function transitive.reduction. Be aware of implications on the edge weights!

Usage

transitiveReduction(mygraph)

Arguments

mygraph graphNEL

Value

Returns the transitive reduction of the supplied graph.

Author(s)

Frank Kramer
unfactorize

Replace factors/levels in a data.frame and use plain strings instead

Description
This function takes a data.frame as argument and returns it with strings instead of factors.

Usage
unfactorize(df)

Arguments
df any data.frame with factor levels in at least one column

Value
The data.frame is returned using strings instead of factors.

Author(s)
Frank Kramer

uniteGraphs

This function unites two graphs.

Description
This function unites the two supplied graphs. Layout parameters from graph1 are used. If colorNodes==TRUE the returned graph has different colors for overlapping nodes and nodes individual for each graph.

Usage
uniteGraphs(graph1, graph2, colorNodes = TRUE, colors = c("#B3E2CD", 
"#FDCDAC", 
"#F4CAE4"))

Arguments
graph1 graphNEL
graph2 graphNEL
colorNodes logical
colors colors character vector of colors. If colorNodes==TRUE these colors are used for graph1 and graph2 respectively.

Value
Return a graph generated by uniting the two supplied graphs
writeBiopax

Author(s)
Frank Kramer

Examples

```r
# load data
data(biopaxexample)
pwid1 = "pid_p_10002_wntpathway"
pwid2 = "pid_p_100146_hespathway"
mygraph1 = pathway2RegulatoryGraph(biopax, pwid1)
mygraph2 = pathway2RegulatoryGraph(biopax, pwid2)
plotRegulatoryGraph(uniteGraphs(mygraph1,mygraph2))
```

writeBiopax  

This function writes out a biopax model.

Description

This function writes out a biopax model, as generated by readBiopax, to either a file or returns the xmlTree if file is omitted.

Usage

```r
writeBiopax(biopax, file = "", verbose = TRUE, overwrite = FALSE,
            namespaces = list(rdf = "http://www.w3.org/1999/02/22-rdf-syntax-ns#",
                              bp = "http://www.biopax.org/release/biopax-level2.owl#",
                              rdfs = "http://www.w3.org/2000/01/rdf-schema#",
                              owl = "http://www.w3.org/2002/07/owl#",
                              xsd = "http://www.w3.org/2001/XMLSchema#"))
```

Arguments

- `biopax`: A biopax model as generated by readBiopax
- `file`: A string giving a file name.
- `verbose`: logical
- `overwrite`: logical, if TRUE an already existing file will be overwritten, otherwise an error is thrown
- `namespaces`: A list of namespaces to use for the generated XML/RDF file

Value

Returns the xmlTree object generated from the biopax model. If a filename is supplied the XML is written to this file.

Author(s)
Frank Kramer

Examples

```r
# load data
data(biopax2example)
## Not run: writeBiopax(biopax, file="mybiopax.owl")
```
