Package ‘rnaSeqMap’

January 15, 2017

Type Package
Title rnaSeq secondary analyses
Version 2.32.0
Date 2014-09-30
Author Anna Lesniewska <alesniewska@cs.put.poznan.pl>; Michal Okoniewski <michal@fgcz.ethz.ch>
Maintainer Michal Okoniewski <michal@fgcz.ethz.ch>
Depends R (>= 2.11.0), methods, Biobase, Rsamtools, GenomicAlignments
Imports GenomicRanges, IRanges, edgeR, DESeq, DBI
Description The rnaSeqMap library provides classes and functions to analyze the RNA-sequencing data using the coverage profiles in multiple samples at a time
License GPL-2

addBamData

Description

Add data from experimental samples stored in BAM file.

Usage

addBamData(rs, file, exp, phenoDesc=NULL)

Arguments

rs SeqReads object to modify
file BAM file to read
exp Numbers of sample slot in the object
phenoDesc A vector to add to phenoData

Value

SeqReads object with samples added from the BAM files. List of BAM files comes from the covdesc. The covdesc content becomes phenoData of the object.
**addDataToReadset**

**Author(s)**
Michal Okoniewski, Anna Lesniewska

**Examples**

```r
# if (xmapConnected())
# {
#   rs <- newSeqReads(1,1,20000,1)
#   rs <- addBamData(rs,1:3)
# }
```

---

**addDataToReadset - adding one more sample in the SeqRead on R level**

**Description**
Add another reads matrix to the readset. No control of region consistency, the matrix needs just 2 columns: starts and ends.

**Usage**
```
addDataToReadset(rs, datain, spl)
```

**Arguments**
- `rs`
- `datain`
- `spl` Number or name of the experimental sample

**Value**
SeqReads object with one more sample added.

**Author(s)**
Michal Okoniewski, Anna Lesniewska

**Examples**

```r
# rs <- newSeqReads(1,1,20000,1)
# my.data1 <- rbind(c(1,50), c(3,53), c(11,60))
# rs <- addDataToReadset(rs, my.data1, 1)
```
addExperimentsToReadset

addExperimentsToReadset - getting sample data from the database.

Description

Add data from experimental samples in the xXMAP database to the readset. Connection to the database required.

Usage

addExperimentsToReadset(rs, exps)

Arguments

rs SeqReads object to modify
exps Vector of numbers of experimental samples in xXMAP

Value

SeqReads object with samples added from the database.

Author(s)

Michal Okoniewski, Anna Lesniewska

Examples

# if (xmapConnected())
# {
#   rs <- newSeqReads(1,1,20000,1)
#   rs <- addExperimentsToReadset(rs,1:3)
# } averageND, sumND, combineNS, log2ND - operations on distributions

averageND

averageND, sumND, combineNS, log2ND - operations on distributions

Description

Set of functions to operate on NucleotideDistr objects.

averageND calculates the mean for samples, sumND adds up selected samples’ distributions, combineND adds two objects with the same size of distribution matrix, log2ND transforms all numeric data in the object into log space.

Usage

averageND(nd, exps);
sumND(nd, exps);
combineND(nd1, nd2);
log2ND(nd);
bam2sig

Arguments

nd, nd1, nd2  NucleotideDistr objects
exps  a pair of numbers of samples in the experiment

Value

NucleotideDistr object of the same type as input objects

Author(s)

Michal Okoniewski, Anna Lesniewska

Examples

```r
# if (xmapConnected())
# {
# rs <- newSeqReads(1,1,20000,1)
# nd.cov <- getCoverageFromRS(rs,1:3)
# nd.avg <- averageND(nd.cov,c(1,3))
# nd.sum <- averageND(nd.cov,c(1,3))
# nd.sum <- combineND(nd.cov,nd.cov)
# nd.log <- log2ND(nd.cov)
# }
```

Description

bam2sig - encapsulated pipeline of finding significant expression

bam2sig

Reads BAM files according to annotation and produces output table processed with DESeq negative binomial test.

Usage

bam2sig(annotlib, covdesc="covdesc", species=NULL, level="gene")

Arguments

annotlib  Character table or data frame with columns: chr, start, end, strand, name
covdesc  Name of the file that includes BAM files (experiment description file)
species  Species name - needed for .chr.convert function - to match BAM and annotation chromosome names
level  The level of annotation for calculating the counts: gene, transcript of exon

Value

Output table with significant expression results, as from DESeq

Author(s)

Michal Okoniewski, Anna Lesniewska
Examples

```r
if (1==0)
{
  all.g <- all.genes(as.vector=F)
  ss <- sample(1:20000, 10)
  genes <- as.data.frame(all.g[ss,])

deseqRes <- bam2sig("cassava.db")
deseqRes[1:10,]
}
```

Description

Creates `CountDataSet` from the data in the database using the list of genes supplied - for further analysis with DESeq.

Usage

```r
buildDESeq(genes, exps, conds=NULL)
```

Arguments

- `genes` vector of Ensembl gene IDs
- `exps` vector of experiments
- `conds` Vector of experimental condition descriptions for the samples

Value

`CountDataSet` object filled with the data of gene-level counts of reads

Author(s)

Michal Okoniewski, Anna Lesniewska

See Also

`buildDGEList`

Examples

```r
# if (xmapConnected())
# {
#   data(sample_data_rnaSeqMap)
#   gg <- names(rs.list)
#   cds <- buildDESeq(gg,1:6, c("a","b","b","a","a","b"))
# }
```
buildDGEList

Description

Creates DGEList from the data in the database using the list of genes supplied - for further analysis with edgeR

Usage

buildDGEList(genes, exps, conds=NULL)

Arguments

genes vector of Ensembl gene IDs
exps vector of experiments
conds Vector of experimental condition descriptions for the samples

Value

DGEList object filled with the data of gene-level counts of reads

Author(s)

Michal Okoniewski, Anna Lesniewska

See Also

buildDESeq

Examples

# if (xmapConnected())
# {
#   data(sample_data_rnaSeqMap)
#   gg <- names(rs.list)
#   cds <- buildDGEList(gg,1:6, c("a","b","b","a","a","b"))
# }
findRegionsAsND

Usage

findRegionsAsIR(nd, mi, minsup=5, exp)

Arguments

nd An object of NucleotideDistr class that has coverage values for a given region
mi The threshold of coverage that makes the region significant
minsup Minimal support of the numeric association rule - namely, in this case, the minimal length of the discovered region
exp Sample (experiment) number

Value

IRanges object with irreducible regions with high coverage.

Author(s)

Michal Okoniewski, Anna Lesniewska

Examples

# if (xmapConnected())
# {
#   rs <- newSeqReads(1,1,20000,1)
#   rs <- addExperimentsToReadset(rs,1:3)
#   nd.cov <- getCoverageFromRS(rs,1:3)
#   nd.regs <- findRegionsAsND(nd.cov, 10)
# }

---

findRegionsAsND findRegionsAsND - finding regions of high coverage using Lindell-Aumann algorithm.

Description

The function is running Lindell-Aumann algorithm to find regions of irreducible expression on the coverage data in the NucleotideDistr object. The function may be used to find the location and boundaries of significant expression of exons and small RNA.

Usage

findRegionsAsND(nd, mi, minsup=5)

Arguments

nd An object of NucleotideDistr class that has coverage values for a given region
mi The threshold of coverage that makes the region significant
minsup Minimal support of the numeric association rule - namely, in this case, the minimal length of the discovered region
**Value**

NucleotideDistr object that includes a matrix with zeros where no region was found and the value of mi for all the nucleotides included in the region. The type of the object is "REG".

**Author(s)**

Michal Okoniewski, Anna Lesniewska

**Examples**

```r
# if (xmapConnected())
# {
#   rs <- newSeqReads(1,1,20000,1)
#   rs <- addExperimentsToReadset(rs,1:3)
#   nd.cov <- getCoverageFromRS(rs,1:3)
#   nd.regs <- findRegionsAsND(nd.cov, 10)
# }
```

---

**Description**

Set of functions to operate on NucleotideDistr objects.

averageND calculates the mean for samples, sumND adds up selected samples’ distributions, combineND adds two objects with the same size of distribution matrix, log2ND transforms all numeric data in the object into log space.

**Usage**

`fiveCol2GRanges(t)`

**Arguments**

`t`  
A matrix or data frame including genomic regions in 5 columns: ID, chr/contig name, start, end, strand

**Value**

GenomicRanges object with the same values

**Author(s)**

Michal Okoniewski
geneInChromosome

description
Finds all the genes in the given chromosome regions

Usage

geneInChromosome(chr, start, end, strand)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chr</td>
<td>Chromosome</td>
</tr>
<tr>
<td>start</td>
<td>Start of the region on a chromosome</td>
</tr>
<tr>
<td>end</td>
<td>End of the region on a chromosome</td>
</tr>
<tr>
<td>strand</td>
<td>Genome strand: 1 or -1</td>
</tr>
</tbody>
</table>

Value

table of the genes in a given regions, produced with stored procedure

Author(s)

Michal Okoniewski, Anna Lesniewska

Examples

```c
# if (xmapConnected())
# {
#   geneInChromosome(1, 1, 80000, 1)
# }
```

---

generators

**Generators for synt data and**

**Description**

Various generators for experiments.

**Usage**

generatorAddSquare(nd, deg, length.prop=0.5)
generatorAdd(nd, deg, length.prop=0.5)
generatorMultiply(nd, deg, length.prop=0.5)
generatorTrunc(nd, deg)
generatorSynth(nd, deg, length.prop=0.5)
generatorPeak(nd, deg, sr=10, mult=10)
Arguments

nd: nucleotide distribution object
deg: degeneration level for the output profile
length.prop: a fraction of the genome region to be degenerated - (0,1)
sr: distance from the 5’ end for the peak
mult: multiplier - how many times the peak is supposed to be higher than the maximum of the distribution

Generators of synthetic and semi-synthetic coverage profiles, for RNA-seq measures testing.

Author(s)

Anna Lesniewska, Michal Okoniewski

Examples

```r
if (1==0)
{
rs <- newSeqReads('chr2', 220238268, 220254744, -1)
f <- c("test1.bam", "test2.bam", "test3.bam", "test4.bam", "test5.bam")
ff <- sapply(f, function(x) system.file("extdata", x, package = "rnaSeqMap"))
rs <- getBamData(rs, 1:5)
nd <- getCoverageFromRS(rs, 1:5)
generatorTrunc(nd, 0.5)
}
```

getBamData - getting sample data from BAM file.

Description

Add data from experimental samples stored in BAM file.

Usage

```r
getBamData(rs, exps = NULL, cvd = NULL, covdesc.file = "covdesc")
```

Arguments

rs: SeqReads object to modify
exps: Vector of numbers of experimental samples
cvd: Covdesc-like data frame - BAM files are read from row names
covdesc.file: Alternatively, the experiment description file

Value

SeqReads object with samples added from the BAM files. List of BAM files comes from the covdesc. The covdesc content becomes phenoData of the object.
getCoverageFromRS

Author(s)
Michal Okoniewski, Anna Lesniewska

Examples

# if (xmapConnected())
# {
#   rs <- newSeqReads(1,1,20000,1)
#   rs <- getBamData(rs,1:3)
# }

description
Calculates the coverage function for the reads encapsulated in the SeqReads object.

Usage
getCoverageFromRS(rs, exps)

Arguments
rs SeqReads object to modify
exps Vector of numbers of experimental samples in xXMAP

Value
NucleotideDistr object with coverage matrix in assayData slot and type "COV".

Author(s)
Michal Okoniewski, Anna Lesniewska

Examples

# if (xmapConnected())
# {
#   rs <- newSeqReads(1,1,20000,1)
#   rs <- addExperimentsToReadset(rs,1:6)
#   nd.cov <- getCoverageFromRS(rs,1:3)
# }
**getData**

*Data accessor function for rnaSeqMap objects containing 'data' field*

**Description**

This function gets the 'data' field from rnaSeqMap objects

**Usage**

`getData(iND)`

**Arguments**

- `iND`: rnaSeqMap object containing 'data' field

**Value**

A list containing 'data' field

**Author(s)**

Michał Okoniewski, Anna Lesniewska, Marek Wiewiórka

---

**getExpDescription**

*getExpDescription*

**Description**

Gets the `bio_sample` table from the database. May be used as `phenoData`.

**Usage**

`getExpDescription()`

**Value**

Table of experimental factors assigned to numbers of samples.

**Author(s)**

Michał Okoniewski, Anna Lesniewska
### getFCFromND

**getFCFromND - calculating fold change of coverages**

**Description**

This function calculates the fold change of two sample coverages from a NucleotideDistr objects. The coverages are assumed to be after logarithmic transformation, so the function basically subtracts the value and generates new NucleotideDistr object with a single vector of fold changes.

**Usage**

getFCFromND(nd, exps)

**Arguments**

- **nd**: NucleotideDistr object with coverages
- **exps**: a pair of numbers of samples in the experiment

**Value**

NucleotideDistr object of type "FC" with a single vector of fold changes

**Author(s)**

Michal Okoniewski, Anna Lesniewska

**Examples**

```r
# if (xmapConnected())
# {  
#   rs <- newSeqReads(1,1,20000,1)
#   rs <- addExperimentsToReadset(rs,1:3)
#   nd.cov <- getCoverageFromRS(rs,1:3)
#   nd.fc <- getFCFromND(nd.cov,c(1,3))
# }
```

---

### getSIFromND

**getSIFromND - calculating splicing index of two coverages**

**Description**

This function calculates the splicing index value of two sample coverages from a NucleotideDistr object. It is assumed that the region in the NucleotideDistr is a single gene. Splicing index is calculated in similar way to the implementation for exon Affy microarrays (see Gardina et al, Genome Biology, 2007 for details), but it is run for each nucleotide in the region and instead of gene-level average expression values, it uses sums of reads for both samples.

**Usage**

getSIFromND(nd, exps)
getSumsExp

Arguments

- nd: NucleotideDistr object with coverages
- exps: a pair of numbers of samples in the experiment

Value

NucleotideDistr object of type "FC" with a single vector of splicing index values

Author(s)

Michal Okoniewski, Anna Lesniewska

Examples

```r
# if (xmapConnected())
# {
#   rs <- newSeqReads(1,1,20000,1)
#   nd.cov <- getCoverageFromRS(rs,1:3)
#   nd.fc <- getSIFromND(nd.cov,c(1,3))
# }
```

---

getSumsExp   getSumsExp

Description

Gets the sum of reads in all the samples present in the database in the seq_read table

Usage

```r
getsumsExp()
```

Value

Vector of sums

Author(s)

Michal Okoniewski, Anna Lesniewska

Examples

```r
# if (xmapConnected())
# {
#   sums <- getsumsExp()
#   nsums
# }
```
gRanges2CamelMeasures  Genomic plots based upon NucleotideDistr objects

Description

Various plots of genomic coverage for data from NucleotideDistr objects

Usage

```r
gRanges2CamelMeasures(gR, cvd, sample.idx1, sample.idx2, sums=NULL, progress=NULL)
allCamelMeasuresForRegion(ch, st, en, str, cvd, sample.idx1, sample.idx2, sums=NULL)
```

Arguments

- `ch`: chromosome name
- `st`: genomic start
- `en`: genomic end
- `str`: strand
- `cvd`: name of the file with BAM description - covdesc
- `gR`: GenomicRanges object to use as a set of genomic regions to query
- `sample.idx1`, `sample.idx2`: sample indices
- `sums`: the vector of sums for normalization
- `progress`: every how many regions print a dot for progress indicator

Author(s)

Michal Okoniewski

Examples

```r
# measures

measures  Measures

Description

Various measures to find differential expression.
Usage

ks_test(dd)
diff_area(dd, cconst)
diff_derivative_area(dd, cconst)
qq_plot(dd)
qq_derivative_plot(dd)
pp_plot(dd)
pp_derivative_plot(dd)
hump_diff1(dd)
hump_diff2(dd)

Arguments

dd a matrix with 2 columns for samples and rows for nucleotides, containing coverage data (like from BED files)
cconst NULL default

The measures give various assessment of the difference between two sequencing samples shapes. Full description will follow in the paper.

Author(s)

Anna Lesniewska, Michal Okoniewski

Examples

# if (xmapConnected())
# {
#   # ks_test(dd)
# }

NDplots

Genomic plots based upon NucleotideDistr objects

Description

Various plots of genomic coverage for data from NucleotideDistr objects

Usage

distrCOVPlot(nd, exps)
distrSIPlot(nd, ex1, ex2, mi, minsup=5)

Arguments

nd NucleotideDistr object
exps vectors of experiment numbers to plot
ex1, ex2 experiment numbers to plot
mi threshold in the region mining algorithm
minsup minimal support - minimal length of the irreducible region found
normalizations

**Author(s)**

Michal Okoniewski, Anna Lesniewska

---

<table>
<thead>
<tr>
<th>normalizations</th>
<th>Normalization Methods</th>
</tr>
</thead>
</table>

**Description**

Various normalization methods.

**Usage**

- `standarizationNormalize(nd)`
- `min_maxNormalize(nd)`
- `densityNormalize(nd)`
- `globalCountsNormalize(nd, sums)`

**Arguments**

- `nd` nucleotide distribution object
- `sums` sum of reads in a sequencing sample

Normalizations of a single coverage profile for multiple samples contained in the `NucleotideDistr` object. Full description will follow in a paper.

**Author(s)**

Anna Lesniewska, Michal Okoniewski

**Examples**

```r
# if (xmapConnected())
# {
#  s <- newSeqReads('chr2', 220238268, 220254744, -1)
#  f <- c("test1.bam", "test2.bam", "test3.bam", "test4.bam", "test5.bam")
#  ff <- sapply(f, function(x) system.file("extdata", x, package = "rnaSeqMap"))
#  rs <- getBamData(rs, 1:5, files = ff)
#  nd <- getCoverageFromRS(rs, 1:5)
#  min_maxNormalize(nd)
# }```

normalizeBySum  

Normalization of NucleotideDistr by global number of reads

Description

normalizeBySum function normalizes the coverage values in NucleotideDistr by dividing all the numbers for all samples by the sum of reads for each sample. The number of reads from each sample may be taken from the database by the function getSumsExp, which is a wrapper for an appropriate SQL procedure. Alternatively, it is passed directly as a vector of numeric values of the same length as the number of samples analyzed. Such simple normalization allows comparisons of the coverage values for samples with different number of reads.

Usage

normalizeBySum(nd,r=NULL)

Arguments

nd  
NucleotideDistr object with raw read counts

r  
Vector of numbers. If there is no such parameter, a database procedure summarizing reads is run

Value

NucleotideDistr object

Author(s)

Michal Okoniewski, Anna Lesniewska

See Also

getSumsExp

Examples

# if (xmapConnected())
# {
#   rs <- newSeqReads(1,10000,20000,1)
#   nd.cov <- getCoverageFromRS(rs,1:3)
#   nd.norm <- normalizeBySum(nd.cov)
#   nd.norm <- normalizeBySum(nd.cov, r=c(100, 200, 1000))
# }
NucleotideDistr-class  Numeric distributions by nucleotide - class

Description
An S4 class that inherits from eSet and holds all the numeric distributions of functions defined over the genome. The values may include coverage, splicing, fold change, etc. for a region defined by genomic coordinates.

Slots/List Components
Objects of this class contain (at least) the following list components:
- chr: numeric matrix containing the read counts.
- start: data.frame containing the library size and group labels.
- end: data.frame containing the library size and group labels.
- strand: data.frame containing the library size and group labels.
- start: data.frame containing the library size and group labels.

Methods
- distribs gives the matrix of distributions from assayData
- getDistr gives a single distributions from assayData as a vector
- newNucleotideDistr (distribs, chr, start, end, strand, type="UNKNOWN", phenoData=NULL, featureData=NULL) constructor from a matrix of data and chromosome coordinates.

Author(s)
Anna Lesniewska, Michal Okoniewski

See Also
SeqReads, NDtransforms

parseGff3  parseGff3 - parsing gff3 file format

Description
Parses gff3 file into genes, transcripts and exons.

Usage
parseGff3(filegff, fileg="genes.txt", filet="transcripts.txt", filee="exons.txt", nofiles=FALSE)
plotGeneCoverage

Arguments

filegff  Input file in GFF3 format
fileg   Filename for output: genes
filet   Filename for output: transcripts
filee   Filename for output: exons
nofiles Flag: just output list, no files

Value

List with elements "genes", "transcripts", "exons" with appropriate tables.

Author(s)

Michal Okoniewski, Anna Lesniewska

Examples

# if (xmapConnected())
# {
#   parseGff3("Athaliana.gff3")
# }

plotGeneCoverage  Genomic plots with rnaSeqMap

Description

Various plots of genomic coverage for experiments.

Usage

plotGeneCoverage(gene_id, ex)
plotRegionCoverage(chr, start, end, strand, ex)
plotExonCoverage(exon_id, ex)
plotCoverageHistogram(chr, start, end, strand, ex, skip)
plotGeneExonCoverage(gene_id, ex)
plotSI(chr, start, end, strand, exp1, exp2)

Arguments

ex  vectors of experiment numbers to plot
exp1, exp2 experiment numbers for splicing index
gene_id  Ensembl gene ID
exon_id  Ensembl exon ID
chr   Chromosome
start  Start position of region on the chromosome
end   Start position of region on the chromosome
strand Strand
skip  size of the bucket in histogram
readsInRange

Author(s)
Michal Okoniewski, Anna Lesniewska

Examples

# if (xmapConnected())
# {
#   plotGeneCoverage("ENSG00000144567", 1:3) # plotting FAM134A for experiments 1,2,3
#   plotRegionCoverage( 2, 220040947, 220050201, 1, 1:3 ) # the same, using coordinates
# }

Description
Finds all the reads for a genomic range

Usage

readsInRange(chr, start, end, strand, ex)

Arguments

- **chr**: Chromosome
- **start**: Start of the region on a chromosome
- **end**: End of the region on a chromosome
- **strand**: Genome strand: 1 or -1
- **ex**: experiment

Value

Table of reads, as in the database

Author(s)
Michal Okoniewski, Anna Lesniewska

Examples

# if (xmapConnected())
# {
#   tmp <- readsInRange( 1, 10000, 20000, 1,3)
# }

regionBasedCoverage

regionBasedCoverage - transformation of the region coverage by the Lindell-Aumann regions

Description

The function builds a NucleotideDistr object from another object of coverage, using sequential call of Lindell-Aumann algorithm on the same data with a sequence of mi-levels. Each nucleotide is assigned the maximum mi-value of a region that covers it.

The output NucleotideDistr object has the distribution without peaks and small drops of coverage, but the trade-off is that the level of coverage are discrete: seq\*maxexp.

Usage

regionBasedCoverage(nd, seqq=1:10, maxexp=20, minsup=5)

Arguments

nd An object of NucleotideDistr class that has coverage values for a given region
seqq Vector of numbers used to divide the range of coverage for subsequent mi-levels
maxexp The maximal mi-level for coverage
minsup Minimal support of the numeric association rule - namely, in this case, the minimal length of the discovered region

Value

NucleotideDistr object that includes a matrix with zeros where no region was found and a maximum of mi-levels used for the sequential region searched. The distributions are similar to coverage, but have removed outliers of coverage peaks and short drops of coverage.

Author(s)

Michal Okoniewski, Anna Lesniewska

Examples

# if (xmapConnected())
# {
# rs <- newSeqReads(1,1,20000,1)
# rs <- addExperimentsToReadset(rs,1:3)
# nd.cov <- getCoverageFromRS(rs,1:3)
# nd.regs <- regionBasedCoverage(nd.cov, 1:10, 100)
# runs the Lindell-Aumann algorithm at 100, 90, ... and picks maximal mi-level, where the nucleotide has a reg
# }

regionCoverage

Description
Finds all the reads for a genomic range

Usage
regionCoverage(chr, start, end, strand, ex, db = "FALSE")

Arguments
- chr: Chromosome
- start: Start of the region on a chromosome
- end: End of the region on a chromosome
- strand: Genome strand: 1 or -1
- ex: experiment
- db: Use database (SQL) implementation of the algorithm

Value
coverage vector, independent from NucleotideDistr

Author(s)
Michal Okoniewski, Anna Lesniewska

Examples
# if (xmapConnected())
# {
#  tmp <- regionCoverage(1, 10000, 20000, 1,3)
# }

RleList2matrix

Description
Function transforms list of Rle objects to matrix.

Usage
RleList2matrix(ll);

Arguments
- ll: list of Rle objects.
Value

Produces the full, unpacked coverage matrix from a list of Rle objects. Used to re-format the coverage data.

Author(s)

Michal Okoniewski, Anna Lesniewska

---

rs.list  

Example of sequencing data for rnaSeqMap library

---

Description

A fragment of sequencing data from 6 samples - human.

Usage

data(sample_data_rnaSeqMap)

Format

A list with 17 SeqReads objects, each with sequencing reads from 6 samples sequenced with ABI SOLID machine.

Examples

```r
# data(sample_data_rnaSeqMap)
# length(rs.list)
# gene1rs <- rs.list[[1]]
```

---

SeqReads  

SeqReads - a container for RNAseq reads

---

Description

SeqReads objects keep the reads information in the form of a list, containing one matrix of reads per experiment. Matrices of dimension n x 2 should come from a mapping to the regions defined by genome coordinates (chromosome, start, end, strand) in the SeqReads object.

The object may be filled in from the database or from list with read data. It is recommended to create one SeqReads object per gene or intergenic region. The object are used then ot create object of class NucleotideDistr

Usage

```r
newSeqReads(chr, start, end, strand, datain=NULL, phenoData=NULL, featureData=NULL, covdesc=NULL)
newSeqReadsFromGene(g)
```
setData

Arguments

- **chr**: Chromosome
- **start**: Start of the region on a chromosome
- **end**: End of the region on a chromosome
- **strand**: Genome strand: 1 or -1
- **datain**: If supplied, it must be a list of matrices of reads start and stop
- **g**: Ensembl identifier of a gene
- **phenoData**: phenoData
- **featureData**: featureData
- **covdesc**: Filename for experiment description

Value

Object of a class SeqReads

Author(s)

Michal Okoniewski, Anna Lesniewska

---

**setData**  
*Data accessor function for rnaSeqMap objects containing ‘data’ field*

Description

This function sets the ‘data’ field from one rnaSeqMap object with ‘data’ field from the other one.

Usage

```
setData(iND1, iND2)
```

Arguments

- **iND1**: target rnaSeqMap object containing ‘data’ field
- **iND2**: source rnaSeqMap object containing ‘data’ field

Value

NULL

Author(s)

Michal Okoniewski, Anna Lesniewska, Marek Wiewiorka
**setSAXPYData**

*Data accessor function for rnaSeqMap objects containing 'data' field*

**Description**

This function sets the 'data' field at i position. The new value is the old one multiplied by a iParam.

**Usage**

```
setSAXPYData(iND1,iParam,i)
```

**Arguments**

- **iND1**: rnaSeqMap object containing 'data' field
- **iParam**: Scaling parameter
- **i**: Index of the 'data' field to be modified

**Value**

NULL

**Author(s)**

Michal Okoniewski, Anna Lesniewska, Marek Wiewiorka

---

**setSpecies**

*setSpecies*

**Description**

Sets the species name for chromosomes X, Y and MT translation into consecutive numbers. If you use xmap.connect, no need to call setSpecies. Both set the internal variable of xmapcore.

**Usage**

```
setSpecies(name=NULL)
```

**Arguments**

- **name**: Species name

**Author(s)**

Michal Okoniewski, Anna Lesniewska

**Examples**

```
setSpecies("mus_musculus")
```
**simplePlot**

**simplePlot - quick plot for the coverages**

**Description**

Plots 2 or 3 coverages with fixed colors.

**Usage**

```r
simplePlot (nd, exps, xlab="genome coordinates", ylab="coverage")
```

**Arguments**

- `nd`: NucleotideDistr object to plot
- `exps`: Samples to plot - numeric vector
- `xlab`: `ylab`

**Author(s)**

Michal Okoniewski

---

**spaceInChromosome**

**spaceInChromosome**

**Description**

Finds all the intergenic spaces in the given chromosome region

**Usage**

```r
spaceInChromosome(chr, start, end, strand)
```

**Arguments**

- `chr`: Chromosome
- `start`: Start of the region on a chromosome
- `end`: End of the region on a chromosome
- `strand`: Genome strand: 1 or -1

**Value**

Table of the intergenic spaces in a given regions, produced with stored procedure

**Author(s)**

Michal Okoniewski, Anna Lesniewska
Examples

```cpp
# if (xmapConnected())
# {
#     spaceInChromosome(1, 1, 8000, 1)
# }
```
