Package ‘soGGi’

January 22, 2017

Type Package

Title Visualise ChIP-seq, MNase-seq and motif occurrence as aggregate plots Summarised Over Grouped Genomic Intervals

Version 1.6.0

Date 2015-12-02

Author Gopuraja Dharmalingam, Tom Carroll

Maintainer Tom Carroll <tc.infomatics@gmail.com>

Description The soGGi package provides a toolset to create genomic interval aggregate/summary plots of signal or motif occurrence from BAM and bigWig files as well as PWM, rlelist, GRanges and GAlignments Bioconductor objects. soGGi allows for normalisation, transformation and arithmetic operation on and between summary plot objects as well as grouping and subsetting of plots by GRanges objects and user supplied metadata. Plots are created using the GGplot2 library to allow user defined manipulation of the returned plot object. Coupled together, soGGi features a broad set of methods to visualise genomics data in the context of groups of genomic intervals such as genes, superenhancers and transcription factor binding events.

c,ChIPprofile-method

Join, subset and manipulate ChIPprofile objects

Description

Join, subset and manipulate ChIPprofile objects

Usage

## S4 method for signature 'ChIPprofile'

\( c(x, \ldots, \text{recursive} = \text{FALSE}) \)

## S4 method for signature 'ChIPprofile'

\( \text{rbind}(x, \ldots, \text{deparse.level} = 1) \)

## S4 method for signature 'ChIPprofile'

\( \text{cbind}(x, \ldots, \text{deparse.level} = 1) \)

## S4 method for signature 'ChIPprofile,ANY,missing'

\( x[[i, j, \ldots]] \)

## S4 method for signature 'ChIPprofile'

\( x\$\text{name} \)

Arguments

- \( j \)
  - Should be missing
- \( \ldots \)
  - objects to be concatenated.
- \( \text{recursive} \)
  - logical. If \( \text{recursive} = \text{TRUE} \), the function recursively descends through lists (and pairlists) combining all their elements into a vector.
- \( \text{deparse.level} \)
  - See \texttt{?base::cbind} for a description of this argument.
- \( x \)
  - object from which to extract element(s) or in which to replace element(s).
indices specifying elements to extract or replace. Indices are numeric or character vectors or empty (missing) or NULL. Numeric values are coerced to integer as by `as.integer` (and hence truncated towards zero). Character vectors will be matched to the names of the object (or for matrices/arrays, the dimnames): see ‘Character indices’ below for further details.

For `[`-indexing only: i, j, ... can be logical vectors, indicating elements/slices to select. Such vectors are recycled if necessary to match the corresponding extent. i, j, ... can also be negative integers, indicating elements/slices to leave out of the selection.

When indexing arrays by `[]` a single argument i can be a matrix with as many columns as there are dimensions of x; the result is then a vector with elements corresponding to the sets of indices in each row of i.

An index value of NULL is treated as if it were integer(0).

name
A literal character string or a name (possibly backtick quoted). For extraction, this is normally (see under ‘Environments’) partially matched to the names of the object.

Value
A ChIPprofile object

Examples
```r
data(chipExampleBig)
x <- c(chipExampleBig[[1]], chipExampleBig[[2]])
y <- rbind(chipExampleBig[[1]], chipExampleBig[[2]])
```

Description
This dataset contains peaks from ChIP-signal over genes

Usage
```r
data(chipExampleBig)
```

Details
- ChIPprofiles

Value
A ChIPprofile object
ChIPprofile-class

The soggi function and ChIPprofile object.

Description

Manual for soggi and ChIPprofile object

The soggi function is the constructor for ChIPprofile objects.

Usage

regionPlot(bamFile, testRanges, samplename = NULL, nOfWindows = 100, 
FragmentLength = 150, style = "point", distanceAround = NULL, 
distanceUp = NULL, distanceDown = NULL, distanceInRegionStart = NULL, 
distanceOutRegionStart = NULL, distanceInRegionEnd = NULL, 
distanceOutRegionEnd = NULL, paired = FALSE, normalize = "RPM", 
plotBy = "coverage", removeDup = FALSE, verbose = TRUE, 
format = "bam", seqlengths = NULL, forceFragment = NULL, 
method = "bin", genome = NULL, cutoff = 80, downSample = NULL, 
minFragmentLength = NULL, maxFragmentLength = NULL)

Arguments

bamFile Character vector for location of BAM file or bigWig, an rleList or PWM matrix.
testRanges GRanges object or character vector of BED file location of regions to plot.
samplename Character vector of sample name. Default is NULL.
nOfWindows Number of windows to bin regions into for coverage calculations (Default 100)
FragmentLength Integer vector Predicted or expected fragment length.
style "Point" for per base pair plot, "percentOfRegion" for normalised length and "re- 
gion" for combined plot
distanceAround Distance around centre of region to be used for plotting
distanceUp Distance upstream from centre of region to be used for plotting
distanceDown Distance downstream from centre of region to be used for plotting
distanceInRegionStart Distance into region start (5’ for Watson/positive strand or notspecified strand Regions,3’ for Crick/negatie strand regions) for plotting.
distanceOutRegionStart Distance out from region start (5’ for Watson/positive strand or notspecified strand Regions,3’ for Crick/negatie strand regions) for plotting.
distanceInRegionEnd Distance into region end (3’ for Watson/positive strand or notspecified strand Regions,5’ for Crick/negatie strand regions) for plotting.
distanceOutRegionEnd Distance out from region end (3’ for Watson/positive strand or notspecified strand Regions,5’ for Crick/negatie strand regions) for plotting.
paired Is data paired end
normalize Calculate coverage as RPM. Presently only RPM available.
findconsensusRegions

Score to be used for plotting. Presently only coverage.

Remove duplicates before calculating coverage.

TRUE or FALSE

character vector of "BAM", "BigWig", "RleList" or "PWM"

Chromosomes to be used. If missing will report all.

Centre fragment and force consistent fragment width.

Character vector of value "bp", "bin" or "spline". The bin method divides a region of interest into equal sized bins of number specified in nOfWindows. Coverage or counts are then summarised within these windows. The spline method creates a spline with the number of spline points as specified in nOfWindows argument.

Down sample BAM reads to this proportion of original.

BSGenome object to be used when using PWM input.

Cut-off for identifying motifs when using PWM input.

Remove fragments smaller than this.

Remove fragments larger than this.

ChIPprofile A ChIPprofile object.

See http://bioinformatics.csc.mrc.ac.uk for more details on soGGi workflows

data(chipExampleBig)
chipExampleBig

findconsensusRegions  Plot coverage of points or regions.

Plot coverage of points or regions.

Returns summits and summmit scores after optional fragment length prediction and read extension

findconsensusRegions(testRanges, bamFiles = NULL, method = "majority", summit = "mean", resizepeak = "asw", overlap = "any", fragmentLength = NULL, NonPrimaryPeaks = list(withinsample = "drop", betweensample = "mean"))

summitPipeline(reads, peakfile, fragmentLength, readlength)
Arguments

testRanges  Named character vector of region locations
bamFiles    Named character vector of bamFile locations
method      Method to select reproducible summits to merge.
summit      Only mean available
resizepeak  Only asw available
overlap     Type of overlap to consider for finding consensus sites
fragmentLength Predicted fragment length. Set to NULL to auto-calculate
NonPrimaryPeaks A list of parameters to deal with non primary peaks in consensus regions.
peakfile    GRanges of genomic intervals to summit.
reads       Character vector of bamFile location or GAlignments object
readlength  Read length of alignments.

Value

Consensus A GRanges object of consensus regions with consensus summits.
Summits  A GRanges object of summits and summit scores.

Description

Create GRangeslist from all combinations of GRanges

Usage

groupByOverlaps(testRanges)

Arguments

testRanges A named list of GRanges or a named GRangesList

Value

groupedGRanges A named GRangesList object.

Examples

data(ik_Example)
gts <- groupByOverlaps(ik_Example)
**Description**

This dataset contains peaks from Ikaros ChIP by two antibodies

**Usage**

data(ik_Example)

**Details**

- Ikpeaksets

**Value**

A list containing two GRanges objects

---

**Description**

This dataset contains signal over peaks from Ikaros ChIP by two antibodies

**Usage**

data(ik_Profiles)

**Details**

- ik_Profiles

**Value**

A ChIPprofile object
normaliseQuantiles

Description

Various normalisation methods for ChIPprofile objects

Usage

```r
## S4 method for signature 'ChIPprofile'
normalise(object)

## S4 method for signature 'ChIPprofile,character,numeric'
normalise(object = "ChIPprofile",
          method = "rpm", normFactors = NULL)
```

Arguments

- `object`: A ChIPprofile object
- `method`: A character vector specifying normalisation method. Currently "rpm" for normalising signal for BAM to total reads, "quantile" to quantile normalise across samples, "signalInRegion" to normalise to proportion of signal within intervals, "normaliseSample" to normalise across samples and "normaliseRegions" to apply a normalisation across intervals.
- `normFactors`: A numeric vector used to scale columns or rows.

Value

A ChIPprofile object

Author(s)

Thomas Carroll

Examples

```r
data(chipExampleBig)
normalise(chipExampleBig, method="quantile", normFactors=1)
```

normaliseQuantiles

Description

Quantile normalisation across bins/regions.
Usage

```r
## S4 method for signature 'ChIPprofile'
normaliseQuantiles(object)
```

```r
## S4 method for signature 'ChIPprofile'
normaliseQuantiles(object = "ChIPprofile")
```

Arguments

object  A ChIPprofile object

Value

A ChIPprofile object containing normalised data

Author(s)

Thomas Carroll

Examples

```r
data(chipExampleBig)
normaliseQuantiles(chipExampleBig)
```

---

Ops,ChIPprofile,ChIPprofile-method

## Arithmetic operations

Description

Arithmetic operations

Usage

```r
## S4 method for signature 'ChIPprofile,ChIPprofile'
Ops(e1, e2)
```

```r
## S4 method for signature 'ChIPprofile,numeric'
Ops(e1, e2)
```

```r
## S4 method for signature 'numeric,ChIPprofile'
Ops(e1, e2)
```

```r
## S4 method for signature 'ChIPprofile'
mean(x, ...)
```

```r
## S4 method for signature 'ChIPprofile'
log2(x)
```

```r
## S4 method for signature 'ChIPprofile'
log(x, base = exp(1))
```
orientBy

Arguments

- `e1` ChIPprofile object
- `e2` ChIPprofile object
- `x` objects.
- `...` further arguments passed to methods.
- `base` a positive or complex number: the base with respect to which logarithms are computed. Defaults to $e^{\exp(1)}$.

Value

A ChIPprofile object of result of arithmetic operation.

Examples

data(chipExampleBig)
chipExampleBig[1] + chipExampleBig[2]

orientBy

Set strand by overlapping or nearest anchor GRanges

Description

Set strand by overlapping or nearest anchor GRanges

Usage

orientBy(testRanges, anchorRanges)

Arguments

- `testRanges` The GRanges object to anchor.
- `anchorRanges` A GRanges object by which to anchor strand orientation.

Value

newRanges A GRanges object.

Examples

data(ik_Example)
strand(ik_Example[[1]]) <- "+
anchoredGRanges <- orientBy(ik_Example[[2]],ik_Example[[1]])
plotRegion

Description
A function to plot regions

Usage
```r
## S4 method for signature 'ChIPprofile'
plotRegion(object, gts, sampleData, groupData, summariseBy, colourBy, lineBy, groupBy, plotregion, outliers, freeScale)

## S4 method for signature 'ChIPprofile'
plotRegion(object = "ChIPprofile", gts = NULL, sampleData = NULL, groupData = NULL, summariseBy = NULL, colourBy = NULL, lineBy = NULL, groupBy = NULL, plotregion = "full", outliers = NULL, freeScale = FALSE)
```

Arguments
- **object**: A ChIPprofile object
- **gts**: A list of character vectors or GRangesList
- **plotregion**: region to plot. For combined plots with style "region", may be "start" or "end" to show full resolution of plot of edges.
- **groupData**: Dataframe of metadata for groups
- **sampleData**: Dataframe of metadata for sample
- **summariseBy**: Column names from GRanges elementmetadata. Formula or character vector of column names to use to collapse genomic ranges to summarised profiles. summariseBy can not be used injunction with groups specified by gts argument.
- **colourBy**: Character vector or formula of either column names from colData(object) containing sample metadata or character vector "group" to colour by groups in gts
- **lineBy**: Character vector or formula of either column names from colData(object) containing sample metadata or character vector "group" to set line type by groups in gts
- **groupBy**: Character vector or formula of either column names from colData(object) containing sample metadata or character "group" to colour by groups in gts
- **outliers**: A numeric vector of length 1 containing proportion from limits to windsorise.
- **freeScale**: TRUE or FALSE to set whether ggplot 2 facets have their own scales. Useful for comparing multiple samples of differing depths without normalisation. Default is FALSE.

Value
A gg object from ggplot2
Author(s)
Thomas Carroll

Examples
```r
data(chipExampleBig)
plotRegion(chipExampleBig[[2]])
```

**pwmCov**

*Example motif coverage*

**Description**
This dataset contains an rlelist of motif coverage

**Usage**
```r
data(pwmCov)
```

**Details**
- pwmCov

**Value**
A rlelist of motif coverage

**pwmToCoverage**

*PWM hits and motif scores as an RLElist*

**Description**
Creates rlelist of pwm hits.
Motif score as an RLElist

**Usage**
```r
pwmToCoverage(pwm, genome, min = "70\%", removeRand = FALSE,
chrsOfInterest = NULL)
makesMotifScoreRle(pwm, regions, genome, extend, removeRand = FALSE,
strandScore = "mean", atCentre = FALSE)
```
Arguments

-_pwm: A PWM matrix object.
-_genome: A BSgenome object.
-_min: pwm score (as percentage of maximum score) cutoff.
-_removeRand: Remove contigs with rand string.
-_chrsOfInterest: Chromosomes to use.
-_regions: GRanges object to include in pwm rlelist.
-_extend: bps to extend regions by.
-_strandScore: Method for averaging strand. Options are max, mean, sum, bothstrands.
-_atCentre: TRUE/FALSE. TRUE assigns score onto 1bp position at centre of motif. FALSE assigns every basepair the sum of scores of all overlapping motifs.

Value

A RLElist of motif density per base pair to be used as input to main soggi function.

Author(s)

Thomas Carroll

Examples

data(pwmCov)
data(singleGRange)

Description

This dataset contains an rlelist of motif coverage.

Usage

data(singleGRange)

Details

- singleGRange

Value

A single GRanges used in motif coverage example/
