Package ‘wateRmelon’

April 26, 2017

Type Package

Title Illumina 450 methylation array normalization and metrics

Version 1.20.0

Date 2017-03-15

Author Leonard C Schalkwyk, Ruth Pidsley, Chloe CY Wong, with functions contributed by Nizar Touleimat, Matthieu Defrance, Andrew Teschendorff, Jovana Maksimovic, Tyler Gorrie-Stone, Louis El Khoury

Maintainer Leo <lschal@essex.ac.uk>

Description 15 flavours of betas and three performance metrics, with methods for objects produced by methylumi and minfi packages.

License GPL-3

Depends R (>= 2.10), Biobase, limma, methods, matrixStats, methylumi, lumi, ROC, IlluminaHumanMethylation450kanno.ilmn12.hg19, illuminaio

**watermelon-package**

**Illumina 450K arrays: normalization and performance metrics**

**Description**

Functions for calculating the index of DNA methylation proportion beta in 15 different ways, and three different ways of estimating data quality or normalization performance.

**Details**

- **Package**: watermelon
- **Type**: Package
- **Version**: 1.0
- **Date**: 2012-10-10
- **License**: GPL3

**Author(s)**

Leonard C Schalkwyk, Ruth Pidsley and Chloe Wong

Maintainer: Who to complain to <leonard.schalkwyk@kcl.ac.uk>

**References**

---

**adaptRefQuantiles**

**Functions from 450-pipeline (Touleimat & Tost)**

**Description**

These functions are part of the 450K pipeline (Touleimat and Tost, Epigenomics 2012 4:325). For freestanding use of the normalization function, a wrapper is provided, see tost

**Value**

see tost

**Author(s)**

Nizar Touleimat, wrapper by Leonard.Schalkwy1@kcl.ac.uk

agep

Age Prediction from methylomic expression data

Description

Predict age of samples using Horvath’s Coefficients

Usage

agep(betas, coeff=NULL, verbose=FALSE,...)

Arguments

betas Matrix of betas or MethyLumiSet or MethylSet object.
coeff If NULL, will default to Horvath’s coefficients. Otherwise can be supplied with vector of own coefficients with an intercept as first element.
verbose If TRUE, agep will additionally print out names of probes per sample that are missing from coefficient list within supplied beta matrix.
... To pass to arguments to downstream functions to specify adult.age

Value

Returns matrix of predicted ages per sample.

Author(s)

Original Functions: Steve Horvath
wateRmelon Implementation: Leo Schalkwyk, Louis El Khoury

References

Horvath S: DNA methylation age of human tissues and cell types. Genome Biology 2013, 14:R115

Examples

data(melon)
agep(melon,coeff=NULL)
# or
agep(betas(melon),coeff=NULL)
Methods for Function as.methylumi

Description

Returns a MethyLumiSet object populated with the data provided. There are MethyLumiSet and MethylSet methods. In the default method, the data is all optional. Please note that for the results to be sane, mn, un, bn, and pv have to be in the same sample and feature order and the same size. The function does not currently do any checks!

Usage

# default method
as.methylumi (mn = NULL, un = NULL, bn = NULL, pv = NULL, qc = NULL, da = NULL,...)

Arguments

mn
matrix of methylated signal intensities, each column representing a sample (generic) or a MethyLumiSet, RGSet, or MethylSet object. Column names are used to get Sentrix row and column by default, see '...'.

un
matrix of unmethylated signal intensities, each column representing a sample (default method) or NULL when mn is an object containing methylated and unmethylated values

bn
matrix of precalculated betas, each column representing a sample

pv
matrix of detection p-values, each column representing a sample

da
annotation data frame, such as x@featureData@data #methylumi package. If NULL (the default), the illuminaHumanMethylation450kmanifest package is used. See the fd argument

qc
control probe intensities: list of 2 matrices, Cy3 and Cy5, with rownames, such as produced by intensitiesByChannel(QCdata(x)) (methylumi package)

...
Other arguments such as a featureData object or optional assayData

Methods

signature(mn = "MethylSet") Coerces a MethylSet to a MethyLumiSet, and provides it with a set of featureData, which by default is just the chromosome and DESIGN (ie typeI or type II assay). Other data can be included using the fd argument, available data is listed by the function getColumns()

signature(mn = "MethyLumiSet") This is mainly useful for adding featureData as described under MethylSet above. MethyLumiSet objects produced by methylumiR have the full annotation, those from methylumiIDAT do not, and functions such as swan require it

signature(mn = "ANY") as.methylumi (mn = NULL, un = NULL, bn = NULL, pv = NULL, qc = NULL, da = NULL,...)
beadc

Calculates the number of samples with bead count < 3 for each probe in matrix of bead count values.

Description
Calculates the number of samples with bead count < 3 for each probe in matrix of bead count values.

Usage
beadc(x)

Arguments
x  matrix of bead count values returned by the beadcount function

Value
Vector of number of samples with bead count < 3 for each probe

Note
The beadc function is internal to the pfilter function

Author(s)
ruth.pidsley@kcl.ac.uk

References

beadcount

Creates matrix of beacounts from minfi data.

Description
Creates matrix of beacounts from data read in using the minfi package. NAs represent probes with beadcount < 3. An Extended RG Channel Set is required for this function to work.

Usage
beadcount(x)

Arguments
x  450K methylation data read in using minfi to create an Extended RG Channel Set
**Beta2M**

**Value**

A matrix of bead counts with bead counts <3 represented by NA for use in the pfilter function for quality control

**Note**

The beadcount function is internal to the pfilter function

**BMIQ**

*Beta-Mixture Quantile (BMIQ) Normalisation method for Illumina 450k arrays*

**Description**

BMIQ is an intra-sample normalisation procedure, correcting the bias of type-2 probe values. BMIQ uses a 3-step procedure: (i) fitting of a 3-state beta mixture model, (ii) transformation of state-membership probabilities of type2 probes into quantiles of the type1 distribution, and (iii) a conformal transformation for the hemi-methylated probes. Exact details can be found in the reference below.

**Usage**

```
BMIQ(beta.v, design.v, nL = 3, doH = TRUE, nfit = 50000, th1.v = c(0.2, 0.75), th2.v = NULL, niter = 5, tol = 0.001, plots = TRUE, sampleID = 1, pri=TRUE)
```

## S4 method for signature 'MethyLumiSet'

```
BMIQ(beta.v, nL=3, doH=TRUE, nfit=5000, th1.v=c(0.2,0.75), th2.v=NULL, niter=5, tol=0.001, plots=FALSE)
CheckBMIQ(beta.v, design.v, pnbeta.v)
```

**Arguments**

- `beta.v` vector consisting of beta-values for a given sample, or a MethyLumiSet or MethylSet containing multiple samples. For the MethyLumiSet and MethylSet methods, this is the only required argument, and the function will be run on each sample.
- `design.v` corresponding vector specifying probe design type (1=type1,2=type2). This must be of the same length as beta.v and in the same order.
- `nL` number of states in beta mixture model. 3 by default. At present BMIQ only works for nL=3.
- `doH` perform normalisation for hemimethylated type2 probes. These are normalised using an empirical conformal transformation and also includes the left-tailed type2 methylated probes since these are not well described by a beta distribution. By default TRUE.
- `nfit` number of probes of a given design type to use for the fitting. Default is 50000. Smaller values (~10000) will make BMIQ run faster at the expense of a small loss in accuracy. For most applications, 5000 or 10000 is ok.
- `th1.v` thresholds used for the initialisation of the EM-algorithm, they should represent best guesses for calling type1 probes hemi-methylated and methylated, and will be refined by the EM algorithm. Default values work well in most cases.
- `th2.v` thresholds used for the initialisation of the EM-algorithm, they should represent best guesses for calling type2 probes hemi-methylated and methylated, and will be refined by the EM algorithm. By default this is null, and the thresholds are estimated based on th1.v and a modified PBC correction method.
- `niter` maximum number of EM iterations to do. This number should be large enough to yield good fits to the type1 distribution. By default 5.
- `tol` tolerance convergence threshold for EM algorithm. By default 0.001.
- `plots` logical specifying whether to plot the fits and normalised profiles out. By default TRUE.
sampleID  the ID of the sample being normalised.

pri  logical: print verbose progress information?

pnbeta.v  BMIQ normalised profile.

Details

Full details can be found in the reference below. Note: these functions require the RPMM package, not currently a dependency of the wateRmelon package.

Value

Default method: A list with following entries:

nbeta  the normalised beta-profile for the sample

class1  the assigned methylation state of type1 probes

class2  the assigned methylation state of type2 probes

av1  the mean beta-values for the nL states for type1 probes

av2  the mean beta-values for the nL states for type2 probes

hf  the estimated "Hubble" dilation factor used in the normalisation of hemi-methylated probes

th1  estimated thresholds for calling unmethylated and methylated type1 probes

th2  estimated thresholds for calling unmethylated and methylated type2 probes

MethyLumiSet method: A methyLumiSet object

Author(s)

Andrew Teschendorff, MethyLumiSet method by Leo Schalkwyk Leonard.Schalkwyk@kcl.ac.uk

References

Examples

```
library(RPMM)
data(melon)
BMIQ(melon,nfit=100)
```
bscon

**bscon**

*Calculate bisulphite conversion*

**Description**

Uses control data from Infinium HumanMethylation450 BeadChip to calculate bisulfite conversion for each array.

**Usage**

```r
bscon(x, ...) # S4 methods exist for RGChannelSet and MethyLumiSet objects
```

**Arguments**

- `x` IDAT or report files containing 450k data
- `...` current methods have no optional arguments

**Details**

This function uses the green and red channels reading of the type I and type II bisulphite conversion data to return the median bisulfite conversion percentage value for each array.

For the type I chemistry the beta values are calculated by dividing the first three probes of the green channel (C1, C2, C3) and the second three probes of the red channel (C4, C5, C6) by the sum of these probes and the unconverted probes of the green (U1, U2, U3) and the red (U4, U5, U6) channel.

The beta values from type II chemistry are calculated by dividing the methylated (red) channels by the sum of methylated (red) and unmethylated (green) channels.

**Value**

A vector of percentage values referring to the bisulfite conversion levels of each array.

**Note**

Updates to HumanMethylationEPIC manifest has seen the removal of control probes C6 and U6. This does not appear to grossly affect how function performs however we are considering alternative approaches to account for this.

**Author(s)**

Louis El Khoury (louis.el-khoury@essex.ac.uk), Eilis Hannon, Leonard Schalkwyk (lschal@essex.ac.uk)

**Examples**

```r
library(wateRmelon)
data(melon)
bs <- bscon(melon)
bs
```
**Description**

Methods for function `colnames` in package `wateRmelon`.

**Methods**

signature(x = "MethyLumiSet") returns the sample names

---

**combo**

*Combine MethyLumiSet objects*

**Description**

This is a wrapper for combining different MethyLumiSet objects.

**Usage**

`combo(...)`

**Arguments**

... Eventually, any number of MethyLumiSet objects. Currently only guaranteed for 2 objects.

**Details**

This is a wrapper for `methylumi::combine`, which works around a name clash with a different combine function from the `gdata` package, and also a bug in `methylumi::combine`.

**Value**

a MethyLumiSet. The assayData, QCdata, experimentData, protocolData and phenoData are joined on sampleName. featureData and annotation are taken from the object given in the first argument

**Note**

the function uses sampleNames and gets rid of duplicates. Numeric sampleNames cause problems (and are a Bad Idea anyway). They should be turned into names with `make.names()` first.

**Author(s)**

Leo Schalkwyk <leonard.schalkwyk@kcl.ac.uk>

*as.methylumi*

Examples

```r
library(wateRmelon)
data(melon)
## pretend we have two different data sets
melon
pelon <- melon
sampleNames(pelon) <- gsub('"Var', 7, sampleNames(pelon))
combo(melon, pelon)
```

**dasen**

*Calculate normalized betas from Illumina 450K methylation arrays*

Description

Multiple ways of calculating the index of methylation (beta) from methylated and unmethylated probe intensities used in Pidsley et al 2012. S4 methods exist where possible for MethyLumiSet, MethylSet, RGSet and exprmethy450 objects.

Usage

```
dasen ( mns, uns, onetwo, fudge = 100, ret2=FALSE, ... )
nasen ( mns, uns, onetwo, ret2=FALSE, fudge = 100, ... )
betaqn( bn )
naten ( mn, un, fudge = 100, ret2=FALSE, ... )
nanet ( mn, un, fudge = 100, ret2=FALSE, ... )
nanes ( mns, uns, onetwo, fudge = 100, ret2=FALSE, ... )
danes ( mn, un, onetwo, fudge = 100, ret2=FALSE, ... )
danet ( mn, un, onetwo, fudge = 100, ret2=FALSE, ... )
daten1( mn, un, onetwo, fudge = 100, ret2=FALSE, ... )
daten2( mn, un, onetwo, fudge = 100, ret2=FALSE, ... )
tost ( mn, un, da, pn )
fuks ( data, anno)
swan ( mn, un, qc, da=NULL, return.MethylSet=FALSE )
```

Arguments

- **mn, mns**: matrix of methylated signal intensities, each column representing a sample (generic) or a MethyLumiSet, RGSet, or MethylSet object. Column names are used to get Sentrix row and column by default, see "...".
- **un, uns**: matrix of unmethylated signal intensities, each column representing a sample (default method) or NULL when mn is an object containing methylated and unmethylated values.
dasen

bn, data  matrix of precalculated betas, each column representing a sample
onetwo  character vector or factor of length nrow(mn) indicating assay type 'I' or 'II'
 pn  matrix of detection p-values, each column representing a sample
da, anno  annotation data frame, such as x@featureData@data #methylumi package. If
        NULL, the swan method requires the IlluminaHumanMethylation450kmanifest
        package.
qc  control probe intensities: list of 2 matrices, Cy3 and Cy5, with rownames, such
        as produced by intensitiesByChannel(QCdata(x)) #methylumi package
fudge  value added to total intensity to prevent denominators close to zero when calcu-
        lating betas
return.MethylSet  if TRUE, returns a MethylSet object instead of a naked matrix of betas.
ret2  if TRUE, returns a list of intensities and betas instead of a naked matrix of betas.
...  additional argument roco for dfsfit giving Sentrix rows and columns. This allows
        a background gradient model to be fit. This is split from data column names by
        default. roco=NULL disables model fitting (and speeds up processing), other-
        wise roco can be supplied as a character vector of strings like 'R01C01' (only
        3rd and 6th characters used).

Details

dasen  same as nasen but type I and type II backgrounds are equalized first. This is our recommended
        method
betaqn  quantile normalizes betas
naten  quantile normalizes methylated and unmethylated intensities separately, then calculates betas
nanet  quantile normalizes methylated and unmethylated intensities together, then calculates betas.
        This should equalize dye bias
nanes  quantile normalizes methylated and unmethylated intensities separately, except for type II
        probes where methylated and unmethylated are normalized together. This should equalize dye bias
        without affecting type I probes which are not susceptible
danes  same as nanes, except type I and type II background are equalized first
danet  same as nanet, except type I and type II background are equalized first
danen  background equalization only, no normalization
daten1  same as naten, except type I and type II background are equalized first (smoothed only for
         methylated)
daten2  same as naten, except type I and type II background are equalized first (smoothed for methyl-
         ated an unmethylated)
nasen  same as naten but type I and typeII intensities quantile normalized separately
tost  method from Touleimat and Tost 2011
fuks  method from Dedeurwaerder et al 2011. Peak correction only, no normalization
swan  method from Maksimovic et al 2012

Value

a matrix (default method) or object of the same shape and order as the first argument containing
betas.

**Description**

db1 is used for quantile normalizing methylated together with unmethylated (dye bias methods nanet, nanes, danes and danet. dfs* functions are used for smoothing the background equalization in methods whose names start with d (daten etc).
Usage

db1(mn, un)
dfsfit(mn, onetwo, roco=unlist(data.frame(strsplit(colnames(mn), "_"),
  stringsAsFactors = FALSE)[2, ]), ...)
dfs2(x, onetwo)

Arguments

mn, x matrix of methylated signal intensities, each column representing a sample (default method), or an object for which a method is available. For dfsfit and dfs2 this can also be a matrix of unmethylated intensities.

un matrix of unmethylated signal intensities, each column representing a sample (default method) or NULL when mn is an object containing methylated and unmethylated values.

onetwo character vector or factor of length nrow(mn) indicating assay type 'I' or 'II'.

roco roco for dfsfit giving Sentrix rows and columns. This allows a background gradient model to be fit. This is split from data column names by default. roco=NULL disables model fitting (and speeds up processing), otherwise roco can be supplied as a character vector of strings like 'R01C01' (3rd and 6th characters used).

... no additional arguments currently used

Details

db1 - quantile normalizes methylated against unmethylated (basic function for dyebuy* dye bias methods). dfsfit - corrects the difference in backgrounds between type I and type II assays and fits a linear model to Sentrix rows and columns if these are available to improve precision where there is a background gradient. dfs2 - finds the difference between type I and type II assay backgrounds for one or more samples.

Value

db1 - a list of 2 matrices of intensities, methylated and unmethylated dfsfit - a matrix of adjusted intensities dfs2 - a background offset value

Author(s)

Leonard.Schalkwyk@kcl.ac.uk

References

dmrse  

**Standard error of iDMR 450k array DNA methylation features**

**Description**

Imprinting differentially methylated regions (iDMRs) are expected to be approximately half methylated, as is observed at the 227 probes in known iDMRs. These functions calculate measures of dispersion for the beta values at these CpG sites, of which the most useful is dmrse_row, which is the between-sample standard error.

**Usage**

```r
dmrse(betas, idmr = iDMR())
dmrse_col(betas, idmr = iDMR())
dmrse_row(betas, idmr = iDMR())
```

**Arguments**

- `betas`: a matrix of betas (default method), a MethyLumiSet object (methyumi package), a MethylSet or RGChannelSet object (minfi package) or a exprmethyl450 object (IMA package).
- `idmr`: a character vector of iDMR probe names such as returned by iDMR()

**Value**

return a standard error of the mean of betas for all samples and iDMR probes (dmrse) or the standard error of the mean for just the between sample component(dmrse_row) or between probe(dmrse_col) component.

**Author(s)**

Leonard.Schalkwyk@kcl.ac.uk

**References**

**See Also**

seabi, a sex-difference metric, and genki, based on SNPs.

**Examples**

```r
#MethyLumiSet method
data(melon)
dmrse(melon)

#MethyLumiSet method after normalization
melon.dasen <- dasen(melon)
dmrse(melon.dasen)
```
**dmrse-methods**

Methods for function `dmrse`, `dmrse_row` and `dmrse_col` in package `wateRmelon`. Please see `dmrse` for details of the calculation of this standard-error performance metric.

**Methods**

signature(betas = "exprmethy450") all of the methods simply extract betas from the data object (which can be a exprmethy450, Methy1Set, MethyLumiSe, or RGChannelSet) and calculate the metric.

---

**genki**

**SNP derived performance metrics for Illumina 450K DNA methylation arrays.**

**Description**

A very simple genotype calling by one-dimensional K-means clustering is performed on each SNP, and for those SNPs where there are three genotypes, the squared deviations are summed for each genotype (similar to a standard deviation for each of allele A homozygote, heterozygote and allele B homozygote). By default these are further divided by the square root of the number of samples to get a standard error-like statistic.

**Usage**

`genki(bn, g = getsnp(rownames(bn)), se = TRUE)`

**Arguments**

- `bn` a matrix of beta values (default method), a MethyLumiSet object (methylumi package), a Methy1Set or RGChannelSet object (minfi package) or an exprmethy450 object (IMA package).
- `g` vector of SNP names
- `se` TRUE or FALSE specifies whether to calculate the standard error-like statistic

**Details**

There are 65 well-behaved SNP genotyping probes included on the array. These each produce a distribution of betas with tight peaks for the three possible genotypes, which will be broadened by technical variation between samples. The spread of the peaks is thus usable as a performance metric.

**Value**

a vector of 3 values for the dispersion of the three genotype peaks (AA, AB, BB : low, medium and high beta values)
Note
Corrected RGChannelSet methods - 12/10/2015

Author(s)
Leonard.Schalkwyk@kcl.ac.uk

References

Examples

```r
#MethyLumiSet method
data(melon)
genki(melon)

#MethyLumiSet method after normalization
melon.dasen <- dasen(melon)
genki(melon.dasen)
```

Description
Methods for function genki in package watermelon. Please see genki for details of the calculation of this standard-error performance metric.

Methods
signature(betas = "exprmethy450") all of the methods simply extract betas from the data object (which can be a exprmethy450, MethylSet, MethyLumiSe, or RGChannelSet) and calculate the metric.

Description

- genkme - genotype calling with 1d k-means
- genkus - apply genkme to available SNPs
- getsnp - grep the rs-numbered probes
- gcose - calculate between-sample SNP standard error
- gcoms - calculate between-sample SNP mean-squared deviation
Usage

genkm(y, peaks = c(0.2, 0.5, 0.8))

Arguments

y                  a vector or matrix of numeric values (betas, between 0 and 1)
peaks              initial values for cluster positions

Details

see genki

Value

see genki

**Internal functions for Illumina i450 normalization functions**

### Description

got and fot find the annotation column differentiating type I and type II assays in MethylSet (got) or MethyLumiSet (fot) objects. pop extracts columns from IlluminaHumanMethylation450k.db

#### Usage

got(obj)
fot(x)

#### Arguments

x                  a MethyLumiSet
obj                a MethylSet

def}

got returns a character vector of 'I' and 'II', fot returns the index of the relevant column. pop returns a data frame
Author(s)
Leonard.Schalkwyk@kcl.ac.uk

iDMR

Description
A character vector of 227 probes on the Illumina 450k methylation array

Usage
data(iDMR)

Format
The format is: chr[1:227] "cg00000029" "cg00155882" "cg00576435" "cg00702231" "cg00765653" "cg00766368" ...

Source
DMR coordinates from https://atlas.genetics.kcl.ac.uk/

References

Examples
data(iDMR)
### maybe str(iDMR); plot(iDMR) ...
Description

This object was derived using methylumiR on an edited GenomeStudio file containing a small subset of features. It works with all of the watermelon package beta functions (see dasen and metrics (see genki, seabi, and dmrse_col) except for swan.

Usage

data(melon)

Format

MethyLumiSet with assayData containing 3363 features, 12 samples

Source

Examples

library(methylumi)
data(melon)
boxplot(log(methylated(melon)), las=2)
## maybe str(melon) ; plot(melon) ...

metrics

Calculate a full set of 450K normalization/performance metrics

Description

Calculate X-chromosome, SNP and imprinting DMR metrics for a matrix of betas from an Illumina 450K Human DNA methylation array. Requires precalculated t-test p-values for sex differences, a list of X-chromosome features and of imprinting DMR features.

Usage

metrics(betas, pv, X, idmr = iDMR, subset = NULL)

Arguments

betas a matrix of betas, each row representing a probe, each column a sample
pv a vector of p-values such as produced by sextest, one per row of betas
X a logical vector of the same length as pv, indicating whether each probe is mapped to the X-chromosome
idmr a character vector of probe names known to be in imprinting DMRs. Can be obtained with iDMR() or data(iDMR)
subset index or character vector giving a subset of betas to be tested
Value

- dmrse_row: see dmrse_row
- dmrse_col: see dmrse_col
- dmrse: see dmrse
- gcoms_a: see genki
- gcose_a: see genki
- gcoms_b: see genki
- gcose_b: see genki
- gcoms_c: see genki
- gcose_c: see genki
- seabird: see seabi

Author(s)

Leonard.Schalkwyk@kcl.ac.uk

References

Examples

data(melon)
melon.dasen <- dasen(melon)
bn <- betas(melon.dasen)
X <- melon.dasen@featureData@data$CHR=='X'
data(iDMR)
sex <- pData(melon.dasen)$sex
pv <- sextest(bn, sex)
melon.metrics <- metrics(bn, pv, X, idmr = iDMR, subset = NULL)

outlyx

Identify Outliers within Methylumi and Minfi packaged objects

Description

Seeks to identify outliers based on multiple (currently 2) outlier detection methods for methylumi and minfi packaged objects.

Usage

outlyx(x, iqr=TRUE, iqrP=2, pc=1,
          mv=TRUE, mvP=0.15, plot=TRUE, ...)

Arguments

x  A MethyLumiSet, MethylSet, RGChannelSet object or matrix containing raw betas.
iqr  If TRUE, the outliers based on interquartile ranges will be determined
iqrP  The number of interquartile ranges outliers are to be identified from designated principle component.
prc  Desired principal component for outlier identification - only used if other principal components want to be discriminated, only used for IQR outlier detection.
mv  If TRUE, the outliers will detected using pcout
mvP  Arbitrary cut-off point for identifying outliers via pcout
plot  If TRUE, alongside regular output, a plot will be constructed displaying relative ‘location’ of each sample. Outliers are those that fall within the highlighted regions.
...  Additional arguments passed to pcout

Value

Returns a dataframe of TRUE/FALSE per sample where TRUE is outlying.

Note

May perform poorly on normalized data

Author(s)

Tyler Gorrie-Stone - tgorri@essex.ac.uk

Examples

library(wateRmelon)
data(melon)
outliers <- outlyx(melon,iqr=TRUE, iqrP=2, pc=1,
mv=TRUE, mvP=0.15, plot=TRUE)
pfILTER

Basic data filtering for Illumina 450 methylation data

Description

The pfilter function filters data sets based on bead count and detection p-values. The user can set their own thresholds or use the default pfilter settings. pfilter will take data matrices of beta values, signal intensities and annotation data, but will also take methylumi (MethyLumiSet) or minfi (RGChannelSetExtended) objects. However it has come to our attention that data read in using the various packages and input methods will give subtly variable data output as they calculate detection p-value and beta values differently, and do/don’t give information about bead count. The pfilter function does not correct for this, but simply uses the detection p-value and bead count provided by each package.

Usage

pfilter(mn, un, bn, da, pn, bc, perCount=NULL, pnthresh = NULL, perc = NULL, pthresh = NULL, logical.return=FALSE)

Arguments

mn matrix of methylated signal intensities, each column representing a sample (default method), or an object for which a method is available e.g MethyLumiSet or RGChannelSetExtended. N.B. Bead count filtering will not work unless data read in as an RGChannelSetExtended rather than an RGChannelSet.

un matrix of unmethylated signal intensities, each column representing a sample (default method) or NULL when mn is a MethyLumiSet or RGChannelSetExtended object

bn matrix of precalculated betas, each column representing a sample, or NULL when mn is a MethyLumiSet or RGChannelSetExtended object

da annotation data frame, such as x@featureData@data #methylumi package, or NULL when mn is a MethyLumiSet or RGChannelSetExtended object

pn matrix of detection p-values, each column representing a sample, a MethyLumiSet or RGChannelSetExtended object

bc matrix of arbitrary values, each column representing a sample and each row representing a probe, in which "NA" represents beadcount <3, or NULL when mn is a MethyLumiSet or RGChannelSetExtended object

perCount remove sites having this percentage of samples with a beadcount <3, default set to 5

pnthresh cutoff for detection p-value, default set to 0.05

perc remove samples having this percentage of sites with a detection p-value greater than pnthresh, default set to 1

pthresh remove sites having this percentage of samples with a detection p-value greater than pnthresh, default set to 1

logical.return If it is TRUE, FALSE or TRUE is returned to indicate success
**pwod**

**Value**

a filtered MethyLumiSet or
a list of the filtered matrices:
mn : methylated intensities
un : unmethylated intensities
bn : betas
da : feature data
or
a filtered MethylSet object.

**Methods**

signature(mn = "MethyLumiSet") This is used for performing the pfilter method on MethyLumiSet objects produced by methylumiR.

signature(mn = "RGChannelSetExtended") This is used for performing the pfilter method on RGChannelSetExtended objects produced by minfi.

**Note**

Adjusted RGChannelSetExtended methods - 12/10/2015 Now outputs a MethylSet object using preprocessRaw from minfi.

**Author(s)**

Ruth.Pidsley@kcl.ac.uk

**References**

**Examples**

```r
# MethyLumiSet method
data(melon)
melon.pf <- pfilter(melon)
```

**Description**

'P'robe-'W'ise 'O'utlier 'D'etection via interquartile ranges.

**Usage**

```r
pwod(object, mul=4)
```
Arguments

object  MethyLumiSet, RGChannelSet, MethylSet object or matrix containing betas.
mul     Number of interquartile ranges used to determine outlying probes. Default is 4 to ensure only very obvious outliers are removed.

Details

Detects outlying probes across arrays in methylumi and minfi objects. Outliers are probable low MAF/SNP heterozygotes.

Value

Returns supplied beta matrix with outlying probes coerced to NA

Author(s)

Tyler Gorrie-Stone - tgorri@essex.ac.uk

Examples

library(wateRmelon)
data(melon)
cattle <- betas(melon)
new.betas <- pwod(cattle, mul=4)

qual

A measure of Normalization Violence

Description

Calculates 4 metrics to assess the degree of difference between normalized and raw betas.

Usage

qual(norm, raw)
**Arguments**

- **norm** Matrix of normalized betas
- **raw** Matrix of raw betas

**Value**

Returns data.frame containing rmsd, sdd, sadd and srms for each sample (columns) in supplied matrices.

**Author(s)**

Leo Schalkwyk

**Examples**

```r
library(wateRmelon)
data(melon)
d.melon <- dasen(melon)
raw.bet <- betas(melon)
norm.bet <- betas(d.melon)
qual(norm=norm.bet, raw=raw.bet)
```

**Description**

Reads Epic arrays from raw idats into MethyLumiSet objects from directory.

**Usage**

`readEPIC(idatPath, barcodes=NULL, pdat=NULL, parallel=F, n=T, oob=F, force=F, ...)`

**Arguments**

- **idatPath** Path directory where .idat files are located. `readEPIC` looks in the specified path and converts all .idats within path to relevant barcodes, which is then passed to a modified version of `methylumIDAT` to parse all idats present in the specified directory.
- **barcodes** If NULL, function will search supplied argument in "idatPath" for all idats within directory. If given a vector of barcodes, `readEPIC` will search for those specific barcodes within the idatPath supplied.
- **parallel** If TRUE, an attempt will be made to process using multiple cores on a multicore machine.
- **pdat** A data.frame describing the samples. A special column named "barcodes" can be used to specify the barcodes to be read when using `methylumIDATepic`. See `methylumIDAT` for usage.
- **n** If TRUE, beadcounts from .idats will be included in final object.
- **oob** If TRUE, out-of-band (OOb) or opposite-channel signals will be kept.
- **force** If TRUE, will combine EPIC IDATs read with differing dmaps.
- **...** Additional arguments passed to `methylumIDAT`
**Details**

Read a set of .idat files within a file directory and return a MethylumiSet object.

**Value**

A MethylumiSet object.

**Note**

Contains heavily modified version of methylumIDAT and other accessory functions used to construct a MethylumiSet object, specifically tailored for EPIC arrays. readEPIC can also handle 450k and 27k arrays as methylumIDAT functionality for these platforms remains unchanged. Alternatively it is possible to invoke methylumIDATepic to use the modified version methylumIDAT, which has similar usage.

**Author(s)**

Tyler Gorrie-Stone - tgorri@essex.ac.uk

**References**

methylumi

**Examples**

```r
# Ficticious file pathway
# path <- "Data/Experiment/Idatlocation"
# data <- readEPIC(path, barcodes = NULL oob=F, n=T)
```

---

**seabi**

*Calculate a performance metric based on male-female differences for Illumina methylation 450K arrays*

**Description**

Calculates an area under ROC curve - based metric for Illumina 450K data using a t-test for male-female difference as the predictor for X-chromosome location of probes. The metric is 1-area so that small values indicate good performance, to match our other, standard error based metrics gcose and dmrse. Note that this requires both male and female samples of known sex and can be slow to compute due to running a t-test on every probe.

**Usage**

```
seabi(bn, stop = 1, sex, X)
```
Arguments

bn  
a matrix of betas (default method) or an object containing betas i.e. a MethyLumiSet object (methyumi package), a MethylSet or RGChannelSet object (minfi package) or a exprmethy450 object (IMA package).

stop  
partial area under curve is calculated if stop value <1 is provided

sex  
a factor giving the sex of each sample (column)

X  
a logical vector of length equal to the number of probes, true for features mapped to X-chromosome

Value

a value between 0 and 1. values close to zero indicate high data quality as judged by the ability to discriminate male from female X-chromosome DNA methylation.

Author(s)

leonard.schalkwyk@kcl.ac.uk

References

Examples

```r
library(methylumi)
data(melon)
sex <- pData(melon)$sex
X <- melon@featureData@data$CHR=='X'
seabi(betas(melon), sex=sex, X=X)

# methylumi method
seabi(melon, sex=sex, X=X)
```

Description

Methods for function seabi in package watermelon. Please see seabi for details of the calculation of this ROC AUC performance metric.

Methods

signature(betas = "exprmethy450") all of the methods simply extract betas from the data object (which can be a exprmethy450, MethylSet, MethyLumiSe, or RGChannelSet) and calculate the metric. All the methods also require a factor differentiating male from female samples.
seabird Calculate ROC area-under-curve for X-chromosome sex differences (internal function for calculating the seabi metric)

Description
This is a wrapper for the prediction and performance functions from the ROCR package that takes a vector of p-values and a vector of true or false for being on the X. See seabi function which does everything.

Usage
seabird(pr, stop = 1, X)

Arguments
- pr: a vector of p-values, such as calculated by seabird
- stop: fraction for partial area under curve. For example 0.1 gives you the area for the lowest 10% of p-values.
- X: logical vector the same length as pv, true for features mapped to X-chromosome

Value
Returns an area value between 0 and 1, where 1 is the best possible performance.

Author(s)
Leonard C Schalkwyk 2012 Leonard.Schalkwyk@kcl.ac.uk

References

sextest Test Illumina methylation 450K array probes for sex difference (internal function for calculating seabi performance metric)

Description
This is a wrapper for lm which does the equivalent of a Student t-test for difference in betas between males and females for each row of a matrix of betas.

Usage
sextest(betas, sex, ...)

References
**Arguments**

- **betas**: a matrix of betas, each row is a probe, each column a sample
- **sex**: a factor with 2 levels for male and female
- ... additional arguments to be passed to `lm`

**Value**

Returns a vector of p-values of length equal to the number of rows of betas

**Author(s)**

Leonard.Schalkwyk@kcl.ac.uk

**References**

**See Also**

seabi seabird

**Examples**

```r
#MethyLumiSet method
data(melon)
sex <- pData(melon)$sex
melon.sextest <- sextest(betas(melon), sex)

#MethyLumiSet method with quality control step
data(melon)
melon.dasen <- dasen(melon)
sex <- pData(melon.dasen)$sex
melon.sextest <- sextest(betas(melon.dasen), sex)
```

**wm_internal**

Internal functions for readEPIC and other watermelon functions introduced in v 1.13.1

**Description**

few if any functions of interest to users

**Usage**

DataToNChannelSet2(mats, chans = c(Cy3 = "GRN", Cy5 = "RED"), parallel = F, protocol.data = F, IDAT
Arguments

mats
chaps
parallel
protocol.data
IDAT
force
