1 Introduction

1.1 Background and objectives

This report describes the analysis of several ChIP-Seq experiments studying the DNA binding patterns of the transcriptional factors ... from organism ... 

1.2 Experimental design

Typically, users want to specify here all information relevant for the analysis of their NGS study. This includes detailed descriptions of FASTQ files, experimental design, reference genome, gene annotations, etc.

2 Load workflow environment

2.1 Load packages and sample data

The `systemPipeR` package needs to be loaded to perform the analysis steps shown in this report (Girke, 2014).

```r
library(systemPipeR)
```

Load workflow environment with sample data into your current working directory. The sample data are described here.

```r
library(systemPipeRdata)
genWorkenvir(workflow="chipseq")
setwd("chipseq")
```

In the workflow environments generated by `genWorkenvir` all data inputs are stored in a `data/` directory and all analysis results will be written to a separate `results/` directory, while the `systemPipeChIPseq.Rnw` script and the `targets` file are expected to be located in the parent directory. The R session is expected to run from this parent directory. Additional parameter files are stored under `param/`.

To work with real data, users want to organize their own data similarly and substitute all test data for their own data. To rerun an established workflow on new data, the initial `targets` file along with the corresponding FASTQ files are usually the only inputs the user needs to provide.

If applicable users can load custom functions not provided by `systemPipeR`. Skip this step if this is not the case.

```r
source("systemPipeChIPseq_Fct.R")
```

2.2 Experiment definition provided by targets file

The `targets` file defines all FASTQ files and sample comparisons of the analysis workflow.

```r
targetspath <- system.file("extdata", "targets_chip.txt", package="systemPipeR")
targets <- read.delim(targetspath, comment.char = "#")
targets[1:4,-c(5,6)]
```

<table>
<thead>
<tr>
<th>File Name</th>
<th>Sample Name</th>
<th>Factor</th>
<th>Sample Long</th>
<th>Sample Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>./data/SRR446027_1.fastq</td>
<td>M1A</td>
<td>M1</td>
<td>Mock.1h.A</td>
<td></td>
</tr>
<tr>
<td>./data/SRR446028_1.fastq</td>
<td>M1B</td>
<td>M1</td>
<td>Mock.1h.B</td>
<td></td>
</tr>
</tbody>
</table>
3 Read preprocessing

3.1 Read quality filtering and trimming

The following example shows how one can design a custom read preprocessing function using utilities provided by the *ShortRead* package, and then apply it with preprocessReads in batch mode to all FASTQ samples referenced in the corresponding SYSargs instance (args object below). More detailed information on read preprocessing is provided in *systemPipeR*’s main vignette.

```r
args <- systemArgs(sysma="param/trim.param", mytargets="targets_chip.txt")
filterFct <- function(fq, cutoff=20, Nexceptions=0) {
  qcount <- rowSums(as(quality(fq), "matrix") <= cutoff)
  fq[qcount <= Nexceptions] # Retains reads where Phred scores are >= cutoff with N exceptions
}
 preprocessReads(args=args, Fct="filterFct(fq, cutoff=20, Nexceptions=0)", batchsize=100000)
writeTargetsout(x=args, file="targets_chip_trim.txt", overwrite=TRUE)
```

3.2 FASTQ quality report

The following seeFastq and seeFastqPlot functions generate and plot a series of useful quality statistics for a set of FASTQ files including per cycle quality box plots, base proportions, base-level quality trends, relative k-mer diversity, length and occurrence distribution of reads, number of reads above quality cutoffs and mean quality distribution. The results are written to a PDF file named *fastqReport.pdf*.

```r
args <- systemArgs(sysma="param/bowtieSE.param", mytargets="targets_chip_trim.txt")
fqlist <- seeFastq(fastq=infile1(args), batchsize=100000, klength=8)
pdf("./results/fastqReport.pdf", height=18, width=4*length(fqlist))
seeFastqPlot(fqlist)
dev.off()
```

![Figure 1: QC report for 18 FASTQ files.](image)

4 Alignments
4.1 Read mapping with Bowtie2

The NGS reads of this project will be aligned with Bowtie2 against the reference genome sequence (Langmead and Salzberg, 2012). The parameter settings of the aligner are defined in the bowtieSE.param file. In ChIP-Seq experiments it is usually more appropriate to eliminate reads mapping to multiple locations. To achieve this, users want to remove the argument setting ‘-k 50 --non-deterministic’ in the bowtieSE.param file.

```
args <- systemArgs(sysma="param/bowtieSE.param", mytargets="targets_chip_trim.txt")
sysargs(args)[1] # Command-line parameters for first FASTQ file
moduleload(modules(args)) # Skip if a module system is not used
system("bowtie2-build ./data/tair10.fasta ./data/tair10.fasta") # Indexes reference genome
runCommandline(args)
writeTargetsout(x=args, file="targets_bam.txt", overwrite=TRUE)
```

Check whether all BAM files have been created
```
file.exists(outpaths(args))
```

4.2 Read and alignment stats

The following provides an overview of the number of reads in each sample and how many of them aligned to the reference.

```
read_statsDF <- alignStats(args=args)
write.table(read_statsDF, "results/alignStats.xls", row.names=FALSE, quote=FALSE, sep="\t")
read.delim("results/alignStats.xls")
```

4.3 Create symbolic links for viewing BAM files in IGV

The symLink2bam function creates symbolic links to view the BAM alignment files in a genome browser such as IGV without moving these large files to a local system. The corresponding URLs are written to a file with a path specified under urlfile, here IGVurl.txt.

```
symLink2bam(sysargs=args, htmldir=c("~/.html/", "somedir/"),
            urlbase="http://biocluster.ucr.edu/~tgirke/",
            urlfile="./results/IGVurl.txt")
```

5 Peak calling with MACS2

5.1 Merge BAM files of replicates prior to peak calling

Merging BAM files of technical and/or biological replicates can improve the sensitivity of the peak calling by increasing the depth of read coverage. The mergeBamByFactor function merges BAM files based on grouping information specified by a factor, here the Factor column of the imported targets file. It also returns an updated SYSargs object containing the paths to the merged BAM files as well as to any unmerged files without replicates. This step can be skipped if merging of BAM files is not desired.

```
args <- systemArgs(sysma=NULL, mytargets="targets_bam.txt")
args_merge <- mergeBamByFactor(args, overwrite=TRUE)
writeTargetsout(x=args_merge, file="targets_mergeBamByFactor.txt", overwrite=TRUE)
```
5.2 Peak calling without input/reference sample

MACS2 can perform peak calling on ChIP-Seq data with and without input samples (Zhang et al., 2008). The following performs peak calling without input on all samples specified in the corresponding args object. Note, due to the small size of the sample data, MACS2 needs to be run here with the ‘--nomodel’ setting. For real data sets, users want to remove this parameter in the corresponding *.param file(s).

```r
args <- systemArgs(sysma="param/macs2_noinput.param", mytargets="targets_mergeBamByFactor.txt")
sysargs(args)[1] # Command-line parameters for first FASTQ file
runCommandLine(args)
file.exists(outpaths(args))
writeTargetsout(x=args, file="targets_macs.txt", overwrite=TRUE)
```

5.3 Peak calling with input/reference sample

To perform peak calling with input samples, they can be most conveniently specified in the SampleReference column of the initial targets file. The function writeTargetsRef uses this information to create a targets file intermediate for running MACS2 with the corresponding input samples.

```r
writeTargetsRef(infile="targets_mergeBamByFactor.txt", outfile="targets_bam_ref.txt", silent=FALSE, overwrite=TRUE)
args <- systemArgs(sysma="param/macs2.param", mytargets="targets_bam_ref.txt")
sysargs(args)[1] # Command-line parameters for first FASTQ file
runCommandLine(args)
file.exists(outpaths(args))
writeTargetsout(x=args, file="targets_macs.txt", overwrite=TRUE)
```

The peak calling results from MACS2 are written for each sample to separate files in the results directory. They are named after the corresponding *.bam files with extensions used by MACS2.

6 Annotate peaks with genomic context

6.1 Annotation with ChIPpeakAnno package

The following annotates the identified peaks with genomic context information using the ChIPpeakAnno and ChIPseeker packages, respectively (Zhu et al., 2010; Yu et al., 2015).

```r
library(ChIPpeakAnno); library(GenomicFeatures)
args <- systemArgs(sysma="param/annotate_peaks.param", mytargets="targets_macs.txt")
txdb <- loadDb("./data/tair10.sqlite")
ge <- genes(txdb, columns=c("tx_name", "gene_id", "tx_type"))
for(i in seq(along=args)) {
  peaksGR <- as(read.delim(infile1(args)[i], comment="#"), "GRanges")
  annotatedPeak <- annotatePeakInBatch(peaksGR, AnnotationData=genes(txdb))
  df <- data.frame(as.data.frame(annotatedPeak), as.data.frame(values(ge[values(annotatedPeak)$feature,])))
  write.table(df, outpaths(args[i]), quote=FALSE, row.names=FALSE, sep="\t")
}
writeTargetsout(x=args, file="targets_peakanno.txt", overwrite=TRUE)
```

The peak annotation results are written for each peak set to separate files in the results directory. They are named after the corresponding peak files with extensions specified in the annotate_peaks.param file, here ‘*.peaks.annotated.xls’.
6.2 Annotation with ChIPseeker package

Same as in previous step but using the `ChIPseeker` package for annotating the peaks.

```r
library(ChIPseeker)
txdb <- loadDb("./data/tair10.sqlite")
for(i in seq(along=args)) {
    peakAnno <- annotatePeak(infile1(args)[i], TxDb=txdb, verbose=FALSE)
    df <- as.data.frame(peakAnno)
    write.table(df, outpaths(args[i]), quote=FALSE, row.names=FALSE, sep="\t")
}
writeTargetsout(x=args, file="targets_peakanno.txt", overwrite=TRUE)
```

Summary plots provided by the `ChIPseeker` package. Here applied only to one sample for demonstration purposes.

```r
peak <- readPeakFile(infile1(args)[1])
covplot(peak, weightCol="X.log10.pvalue.")
peakHeatmap(outpaths(args)[1], TxDb=txdb, upstream=1000, downstream=1000, color="red")
plotAvgProf2(outpaths(args)[1], TxDb=txdb, upstream=1000, downstream=1000, xlab="Genomic Region (5'->3')")
```

7 Count reads overlapping peak regions

The `countRangeset` function is a convenience wrapper to perform read counting iteratively over several range sets, here peak range sets. Internally, the read counting is performed with the `summarizeOverlaps` function from the `GenomicAlignments` package. The resulting count tables are directly saved to files, one for each peak set.

```r
library(GenomicRanges)
args <- systemArgs(sysma="param/count_rangesets.param", mytargets="targets_macs.txt")
args_bam <- systemArgs(sysma=NULL, mytargets="targets_bam.txt")
bfl <- BamFileList(outpaths(args_bam), yieldSize=50000, index=character())
countDFnames <- countRangeset(bfl, args, mode="Union", ignore.strand=TRUE)
writeTargetsout(x=args, file="targets_countDF.txt", overwrite=TRUE)
```

8 Differential binding analysis of peaks

The function `runDiff` performs differential binding analysis in batch mode for several count tables using `edgeR` or `DESeq2` (Robinson et al., 2010; Love et al., 2014). Internally, it calls the functions `run_edgeR` and `run_DESeq2`. It also returns the filtering results and plots from the downstream `filterDEGs` function using the fold change and FDR cutoffs provided under the `dbrfilter` argument.

```r
args_diff <- systemArgs(sysma="param/rundiff.param", mytargets="targets_countDF.txt")
cmp <- readComp(file=args_bam, format="matrix")
dblist <- runDiff(args=args_diff, diffFct=run_edgeR, targets=targetsin(args_bam),
                   cmp=cmp[[1]], independent=TRUE, dbrfilter=c(Fold=2, FDR=1))
writeTargetsout(x=args_diff, file="targets_rundiff.txt", overwrite=TRUE)
```

9 GO term enrichment analysis

The following performs GO term enrichment analysis for each annotated peak set.
10 Motif analysis

10.1 Parse DNA sequences of peak regions from genome

Enrichment analysis of known DNA binding motifs or de novo discovery of novel motifs requires the DNA sequences of the identified peak regions. To parse the corresponding sequences from the reference genome, the getSeq function from the Biostrings package can be used. The following example parses the sequences for each peak set and saves the results to separate FASTA files, one for each peak set. In addition, the sequences in the FASTA files are ranked (sorted) by increasing p-values as expected by some motif discovery tools, such as BCRANK.

```r
library(Biostrings); library(seqLogo); library(BCRANK)
args <- systemArgs(sysma="param/annotate_peaks.param", mytargets="targets_macs.txt")
rangefiles <- infile1(args)
for(i in seq(along=rangefiles)) {
  df <- read.delim(rangefiles[i], comment="#")
  peaks <- as(df, "GRanges")
  names(peaks) <- paste0(as.character(seqnames(peaks)), "_", start(peaks), ",", end(peaks))
  peaks <- peaks[order(values(peaks)$X.log10.pvalue, decreasing=TRUE)]
  pseq <- getSeq(FaFile("./data/tair10.fasta"), peaks)
  names(pseq) <- names(peaks)
  writeXStringSet(pseq, paste0(rangefiles[i], ".fasta"))
}
```

10.2 Motif discovery with BCRANK

The Bioconductor package BCRANK is one of the many tools available for de novo discovery of DNA binding motifs in peak regions of ChIP-Seq experiments. The given example applies this method on the first peak sample set and plots the sequence logo of the highest ranking motif.

```r
set.seed(0)
BCRANKout <- bcrank(paste0(rangefiles[1], ".fasta"), restarts=25, use.P1=TRUE, use.P2=TRUE)
toptable(BCRANKout)
topMotif <- toptable(BCRANKout, 1)
weightMatrix <- pwm(topMotif, normalize = FALSE)
weightMatrixNormalized <- pwm(topMotif, normalize = TRUE)
pdf("results/seqlogo.pdf")
seqLogo(weightMatrixNormalized)
dev.off()
```
Figure 2: One of the motifs identified by BCRANK
