Package ‘MAQCsubset’

March 23, 2017

Title Experimental Data Package: MAQCsubset
Version 1.12.0
Author VJ Carey
Maintainer VJ Carey <stvjc@channing.harvard.edu>
Depends R (>= 2.10.0), affy (>= 1.23.4), Biobase (>= 2.5.5), lumi, methods
Suggests genefilter, codelink
License Artistic-2.0
biocViews ExperimentData, MicroarrayData, GEO
LazyLoad true
NeedsCompilation no

R topics documented:

proboStruct-class ....................................................... 4

Index 6

gehMAQCsubDef  Excerpt from GE Codelink array contributions to MAQC

Description

Excerpt from GE Codelink contributions to MAQC

Usage

data(gehSubRaw)
data(gehMAQCsubDef)
Details

gehSubRaw is a codelink::Codelink instance based on reading the raw GEO files: "GSM123122\GEH\1\A1.TXT" "GSM123123\GEH\1\A2.TXT" "GSM123127\GEH\1\B1.TXT" "GSM123128\GEH\1\B2.TXT" "GSM123132\GEH\1\C1.TXT" "GSM123133\GEH\1\C2.TXT" "GSM123137\GEH\1\D1.TXT" "GSM123138\GEH\1\D2.TXT"

gehMAQCsubDef is an ExpressionSet instance based on default background correction and normalization of the codelink package. The original feature names include duplicates; these were made unique by `make.names` with `unique=TRUE`.

gnfCerebHi Gene lists for hi or low abundance in cerebellum according to Novartis GNF symatlas

Description

Data frames with gene lists for hi or low abundance in cerebellum according to Novartis GNF symatlas

Usage

data(gnfCerebHi)
data(gnfCerebLow)

Details

The symatlas.gnf.org database was searched using the germa version of human gene atlas for genes having expression in cerebellum at least 3 times (or at most 1/3 times) median expression over all organs surveyed. The resulting gene lists were intersected with genes present on GE codelink (version used in MAQCsubset) and hgu95a.

Value

data.frame instances with columns providing gene name, affy probe set identifier, codelink probe identifier, illuminaHumanv1 identifier.

Author(s)

Vince Carey <stvjc@channing.harvard.edu>

Examples

data(gnfCerebHi)
gnfCerebHi[1:3,]
MAQCsubset

Experimental Data Package: MAQCsubset

Description
selected data from the MAQC project (Nature Biotechnology, Sept. 2006)

Usage
data(afxsubRMAES)
data(afxsubRMA)
data(afxsub)

Format
The format is: An ExpressionSetObject with covariates:
• site: from cel
• samp: ma src/mixture code
• repl: replicate

Note
afxsubRMA is an exprSet (deprecated) and afxsub is an AffyBatch. afxsubRMAES is a proper ExpressionSet instance.
ilmMAQCsubR is the result of applying lumiR to the files in the vicinity of GEO GSM122901 with filename suffixes matching those of the sampleNames in the set.

Examples
data(afxsubRMAES)

proboscis

Produce a plot similar to Figure 2 of the Shippy MAQC paper (PMID 16964226).

Description
Produce a plot similar to Figure 2 of the Shippy MAQC paper (PMID 16964226).

Usage
proboscis(es, site=1, ABp=0.001, CDp=0.01, mmrad=100)
proboStruct-class

Arguments

es \(\text{ExpressionSet}\) instance with MAQC assay results

site numeric code – site to be assessed

\(\text{ABp}\) \(\text{ABp}\) – p-value threshold to declare concentration of gene in sample A to be different from the concentration in sample B

\(\text{CDp}\) \(\text{CDp}\) – p-value threshold to declare concentration of gene in sample C to be different from the concentration in sample D

\(\text{mmrad}\) numeric radius of the moving mean used to smooth the proportions differentially expressed

Details

Figure 2 of the Shippy paper consists of a collection of plots of estimated probabilities of self-consistent monotone titration – briefly, samples are such that A has 100% USRNA, B has 100% Ambion brain, C has 75% USRNA+25% brain, D has 25% USRNA, 75% brain. Self-consistent monotone titration holds for gene g if microarray measures for that gene satisfy \(A > C > D > B\) or \(B > C > D > A\). The estimated probability functions look like a creature sticking its nose over a wall, thus the name of this function.

Value

an instance of \(\text{proboStruct}\), for which a plot and lines method are available.

Author(s)

Vince Carey <stvjc@channing.harvard.edu>

References

PMID 16964226

Examples

data(afxsubRMAES)

NN2 = proboscis(afxsubRMAES, site=2)
plot(NN2)

---

proboStruct-class \textit{Class} "proboStruct"

Description

structure for managing proboscis plot data

Objects from the Class

Objects can be created by calls of the form \texttt{new("proboStruct", ...)}. 
Slots

- \texttt{.Data}: Object of class "list" ~-
- \texttt{call}: Object of class "call" ~-

Extends

Class "\texttt{list}", from data part. Class "\texttt{vector}", by class "list", distance 2. Class \texttt{AssayData-class}, by class "list", distance 2.

Methods

- \texttt{plot}

Note

The proboscis plot shows how the probability of self-consistent monotone titration (SCMT) varies with the spiked difference in concentrations of two mRNA preparations in an MAQC dataset.
