1 Introduction

The *SurvComp* package is providing functions to assess and to statistically compare the performance of risk prediction (survival) models. It includes (i) implementation of state-of-the-art statistics developed to measure the performance of risk prediction models and (ii) to combine these statistics estimated from multiple datasets using a meta-analytical framework, functions (iii) to visualize those measurements in a clear and compact way, and (iv) to statistically compare the performance of competitive models.

1.1 Installation

SurvComp requires that *survival*, *ipred*, *prodlm*, *survivalROC*, *SuppDists*, *bootstrap* and *R* ($\geq 2.3.0$) are installed. These should be installed automatically when you install *SurvComp*. To install *SurvComp*:

```
> if (!requireNamespace("BiocManager", quietly=TRUE))
+   install.packages("BiocManager")
> BiocManager::install("survcomp")
```

Load the *SurvComp*, into your current workspace:

```
> library(survcomp)
```

1.2 Further help

To view the *SurvComp* description and a summary of all the functions within *SurvComp*, type the following:

```
> library(help=survcomp)
```

1.3 Citing

We are delighted if you use this package. Please do email us if you find a bug or have a suggestion. We would be very grateful if you could cite:

B. Haibe-Kains, C. Desmedt, C. Sotiriou and G. Bontempi (2008) A comparative study of survival models for breast cancer prognostication based on microarray data: does a single gene beat them all? *Bioinformatics* **24(19)**:2200-2208.

2 A use case: from expression data to survival analysis

We will very briefly demonstrate some of the functions in *SurvComp*. We use the `breastCancerData` datafile for demonstration purposes, it includes subsets of the datasets *breastCancerMAINZ*, *breastCancerTRANSBIG*, *breastCancerUPP*, *breastCancerUNT*, *breastCancerVDX* and *breastCancerNKI*, available as experimental datapackages on Bioconductor. The six datasets in `breastCancerData` contain the genes AURKA (also known as STK6, STK7, or STK15), PLAU (also known as uPA), STAT1, VEGF, CASP3, ESR1, and ERBB2, as introduced by Desmedt et al. 2008 [1]. The seven genes represent the proliferation, tumor invasion/metastasis, immune response, angiogenesis, apoptosis phenotypes, and the ER and HER2 signaling, respectively.

2.1 Overview

To use the `ExpressionSet` object we have to load the *Biobase* package. We also make use of the package *xtable* in order to visualize some of the results as tables in this Vignette.

```
> library(Biobase)
> library(xtable)
> library(rmeta)
> library(xtable)
```

Loading the `breastCancerData` object will results in 6 new objects. If you execute `ls()` you will see `mainz7g`, `transbig7g`, `upp7g`, `unt7g`, `vd7g` and `nki7g`. More details about these datasets are available in the `breastCancerData` manpage (`?breastCancerData`).

```
> data(breastCancerData)
> mainz7g
```

```
ExpressionSet (storageMode: lockedEnvironment)
assayData: 7 features, 200 samples
  element names: exprs
protocolData: none

Table 1: Overview of the annotation of the seven genes.

```
fvarMetadata: labelDescription
experimentData: use 'experimentData(object)'
pubMedIds: 18593943
Annotation: hg133a
```

Before we can start the analysis, we have to define the annotation for the mentioned seven genes, the datasets we use and a few help-variables. We define the gene symbol list (`gsList`), the entrez-gene ID list (`gidList`), the probe names for the Agilent microarray (`probesNKI`), the probe names for the Affymetrix microarray (`probesAffy`), a list containing the dataset names (`datasetList`), spaces for displaying the text in the forestplot at the right place (`myspace` and `mybigspace`) and `tc` for setting the censored time to 10 years. We converted the gene symbols for each gene to lowercase for better separation from the datasets. Table 1 gives an overview of the gene annotation.

```
> gsList <- tolower(fData(mainz7g)[, "Gene.symbol"])
> gidList <- fData(mainz7g)[, "Gene.ID"]
> probesNKI <- as.character(fData(nki7g)[, "probe"])
> probesAffy <- fData(mainz7g)[, "probe"]
> datasetList <- c("MAINZ", "TRANSBIG", "UPP", "UNT", "VDX", "NKI", "", "Overall")
> myspace <- " "
> mybigspace <- "      "
> tc <- 10 * 365
```

2.2 Computing concordance index, D index and hazard ratio

To compute the concordance index [2, 3] for each gene in each dataset, we have to call the `concordance.index()` function for each dataset. See `'?concordance.index'` for details. The following command shows the computation of the concordance index for each gene in the `mainz7g` dataset.

	Min	Max
MAINZ	4.05	14.57
TRANSBIG	4.87	15.18
UPP	4.13	11.22
UNT	-5.04	3.77
VDX	2.77	15.61
NKI	-1.62	0.93

Table 2: Overview of the gene expression ranges in the six datasets.

```
> cindexall.mainz.small <- t(apply(X=exprs(mainz7g), MARGIN=1, function(x, y, z) { tt <-
```

To compute the D index [4] for each gene in each dataset, we have to call the `D.index()` function. See `'?D.index'` for details. The following command shows the computation of the D index for each gene in the `mainz7g` dataset.

```
> dindexall.mainz.small <- t(apply(X=exprs(mainz7g), MARGIN=1, function(x, y, z) {
+   tt <- D.index(x=x, surv.time=y, surv.event=z, na.rm=TRUE);
+   return(c("dindex"=tt$d.index, "dindex.se"=tt$se, "lower"=tt$lower, "upper"=tt$upper,
+   y=pData(mainz7g)[ , "t.dmts"], z=pData(mainz7g)[ , "e.dmts"])))
```

To compute the hazard ratio [5] for each gene in each dataset, we have to call the `hazard.ratio()` function. See `?hazard.ratio` for details. Before we compute the hazard ratio, we have to rescale the gene expression data for each dataset to a comparable scale, since the Affymetrix and Agilent microarrays have a different range of their gene expression, which would affect the hazard ratio computation. Table 2 gives an overview of the gene expression ranges in the six datasets that are included in `breastCancerData`.

Therefore we use the following function to rescale the gene expression values to lie approximately in `[-1,1]`, robust to extreme values (possibly outliers).

```
> rescale <- function(x, na.rm=FALSE, q=0.05) {
+   ma <- quantile(x, probs=1-(q/2), na.rm=na.rm)
+   mi <- quantile(x, probs=q/2, na.rm=na.rm)
+   x <- (x - mi) / (ma - mi)
+   return((x - 0.5) * 2)
+ }
```

The following command shows the rescaling and the computation of the hazard ratio for each gene in the `mainz7g` dataset.

```
> hratio.mainz.small <- t(apply(X=rescale(exprs(mainz7g)) , q=0.05, na.rm=TRUE), MARGIN=1,
+   tt <- hazard.ratio(x=x, surv.time=y, surv.event=z, na.rm=TRUE);
```

```
+   return(c("hratio"=tt$hazard.ratio, "hratio.se"=tt$se, "lower"=tt$lower, "upper"=tt$upper,
+   y=pData(mainz7g)[ , "t.dmfs"], z=pData(mainz7g)[ , "e.dmfs"])))
```

To get an overall estimate over all datasets for the concordance index from each gene, we iterate over all the concordance indices of all datasets and combine them with the `combine.est()` function [6] and recalculate the lower- and upper border accordingly. We do that for the D indices and the hazard ratios in the same way.

2.3 Combining estimations across datasets

```
> tt <- as.data.frame(NULL)
> for(i in 1:7){
+   tt <- rbind(
+     tt, combine.est(
+       x=cbind( cindexall.mainz.small[i, "cindex"],
+         cindexall.transbig.small[i, "cindex"],
+         cindexall.upp.small[i, "cindex"],
+         cindexall.unt.small[i, "cindex"],
+         cindexall.vdx.small[i, "cindex"],
+         cindexall.nki.small[i, "cindex"]),
+       x.se=cbind( cindexall.mainz.small[i, "cindex.se"],
+         cindexall.transbig.small[i, "cindex.se"],
+         cindexall.upp.small[i, "cindex.se"],
+         cindexall.unt.small[i, "cindex.se"],
+         cindexall.vdx.small[i, "cindex.se"],
+         cindexall.nki.small[i, "cindex.se"]), na.rm=TRUE)
+     )
+ }
> tt$lower <- tt$estimate + qnorm(0.025, lower.tail=TRUE) * tt$se
> tt$upper <- tt$estimate + qnorm(0.025, lower.tail=FALSE) * tt$se
> rownames(tt) <- gsList
> colnames(tt) <- c("cindex", "cindex.se", "lower", "upper")
> ccindex <- tt
```

The combined concordance indices for the six datasets are shown in table 3.

The combined log2 D indices for the six datasets are shown in table 4.

The combined log2 hazard ratios for the six datasets are shown in table 5.

2.4 The forestplot.surv

To display the combined concordance indices of each genes over all datasets, we use the `forestplot.surv()` function [7]. The resulting forestplot for all concordance indices is:

	cindex	cindex.se	lower	upper
esr1	0.46	0.02	0.43	0.49
erbb2	0.50	0.02	0.47	0.53
aurka	0.64	0.01	0.62	0.67
plau	0.52	0.01	0.49	0.55
vegfa	0.56	0.01	0.53	0.59
stat1	0.53	0.01	0.51	0.56
casp3	0.52	0.01	0.50	0.55

Table 3: Combined concordance indices of each gene for the six datasets.

	dindex	dindex.se	lower	upper
esr1	-0.17	-3.64	-0.45	0.07
erbb2	0.09	-3.62	-0.14	0.29
aurka	0.96	-3.66	0.84	1.07
plau	0.24	-3.63	0.03	0.42
vegfa	0.45	-3.65	0.28	0.61
stat1	0.19	-3.69	-0.01	0.37
casp3	0.19	-3.66	-0.02	0.37

Table 4: Combined log2 D indices of each gene for the six datasets.

	hratio	hratio.se	lower	upper
esr1	-0.27	-3.63	-0.57	-0.01
erbb2	0.38	-3.11	0.10	0.61
aurka	2.07	-2.59	1.95	2.18
plau	0.84	-2.34	0.50	1.13
vegfa	0.93	-2.79	0.69	1.13
stat1	0.48	-2.68	0.12	0.76
casp3	3.24	-1.23	3.11	3.36

Table 5: Combined log2 hazard ratios of each gene for the six datasets.

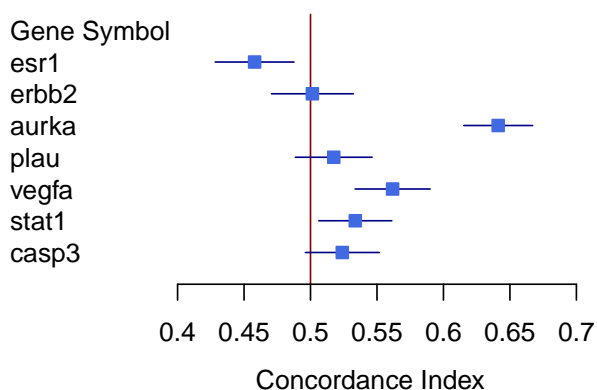

```

> labeltext <- cbind(c("Gene Symbol",gsList),c(rep(myspace,8)))
> bs <- rep(0.5, nrow(labeltext))
> r.mean <- c(NA,ccindex$cindex)
> r.lower <- c(NA,ccindex$lower)
> r.upper <- c(NA,ccindex$upper)
> forestplot.surv(labeltext=labeltext, mean=r.mean, lower=r.lower, upper=r.upper, zero=
+   align=c("l"), graphwidth=grid::unit(2, "inches"), x.ticks=seq(0.4,0.7,0.05), xlab=

```

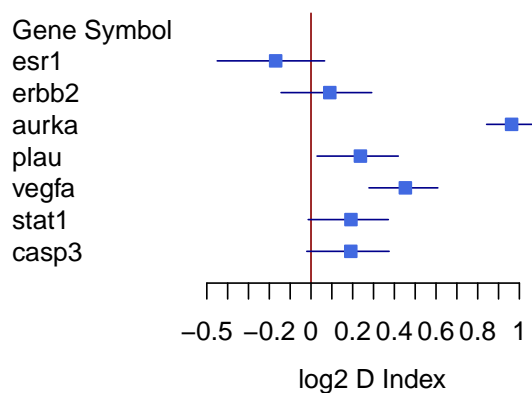

```
+ col=meta.colors(box="royalblue", line="darkblue", zero="darkred"), box.size=bs, c
```

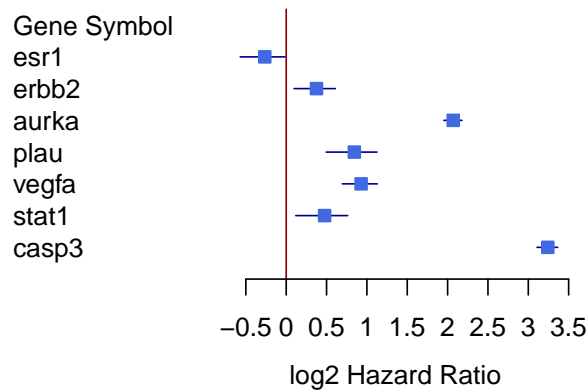

The resulting forestplot for all D indices is:

```
> labeltext <- cbind(c("Gene Symbol",gsList),c(rep(myspace,8)))
> bs <- rep(0.5, nrow(labeltext))
> r.mean <- c(NA,log2(cdindex$dindex))
> r.lower <- c(NA,log2(cdindex$lower))
> r.upper <- c(NA,log2(cdindex$upper))
> forestplot.surv(labeltext=labeltext, mean=r.mean, lower=r.lower, upper=r.upper, zero=
+ align=c("l"), graphwidth=grid::unit(2, "inches"), x.ticks=seq(-0.5,1,0.1), xlab=p
+ col=meta.colors(box="royalblue", line="darkblue", zero="darkred"), box.size=bs, c
```

The resulting forestplot for all hazard ratios is:

```
> labeltext <- cbind(c("Gene Symbol",gsList),c(rep(mybigspace,8)))
> bs <- rep(0.5, nrow(labeltext))
> r.mean <- c(NA,log2(chratio$hratio))
> r.lower <- c(NA,log2(chratio$lower))
> r.upper <- c(NA,log2(chratio$upper))
> forestplot.surv(labeltext=labeltext, mean=r.mean, lower=r.lower, upper=r.upper, zero=
+   align=c("l"), graphwidth=grid::unit(2, "inches"), x.ticks=seq(-0.5,3.5,0.5), xla
+   col=meta.colors(box="royalblue", line="darkblue", zero="darkred"), box.size=bs, c
```

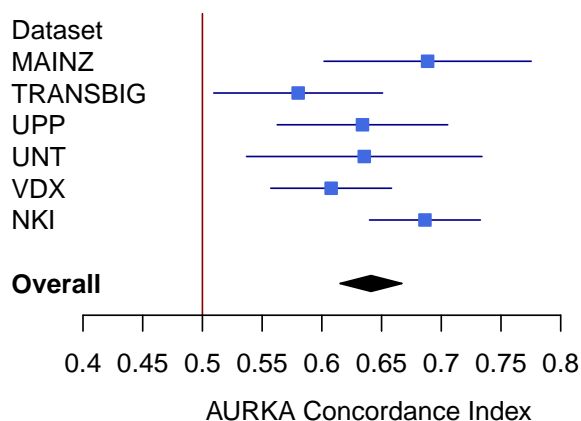

Taking a more specific look, e.g. at the genes AURKA and VEGF, we create the forestplot the same way as before, showing the concordance indices for both genes in each dataset and the combined estimation over all datasets.

```
> tt <- rbind(cindexall.mainz.small[3,],
+             cindexall.transbig.small[3,],
+             cindexall.upp.small[3,],
+             cindexall.unt.small[3,],
+             cindexall.vdx.small[3,],
+             cindexall.nki.small[3,],
+             NA,
+             as.numeric(ccindex[3,]))
> rownames(tt) <- datasetList
> tt <- as.data.frame(tt)
> labeltext <- cbind(c("Dataset",datasetList),c(rep(mybigspace,length(datasetList)+1)))
> bs <- rep(0.5, nrow(labeltext))
> r.mean <- c(NA,tt$cindex)
> r.lower <- c(NA,tt$lower)
```

```

> r.upper <- c(NA,tt$upper)
> forestplot.surv(labeltext=labeltext, mean=r.mean, lower=r.lower, upper=r.upper, zero=
+   align=c("l"), graphwidth=grid::unit(2, "inches"), x.ticks=seq(0.4,0.8,0.05), xla
+   col=meta.colors(box="royalblue", line="darkblue", zero="darkred"), box.size=bs, c

```

```

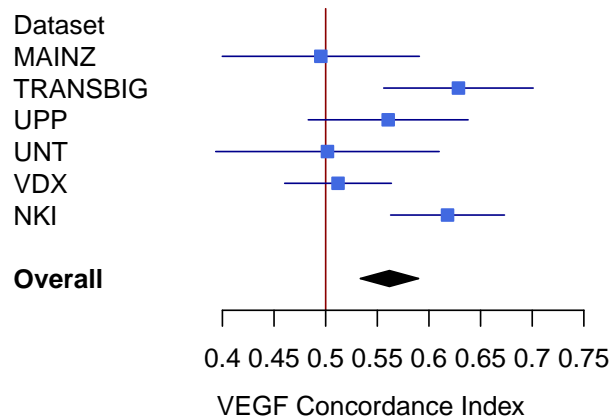

> tt <- rbind(cindexall.mainz.small[5,],
+   cindexall.transbig.small[5,],
+   cindexall.upp.small[5,],
+   cindexall.unt.small[5,],
+   cindexall.vdx.small[5,],
+   cindexall.nki.small[5,],
+   NA,
+   as.numeric(ccindex[5,]))
> rownames(tt) <- datasetList
> tt <- as.data.frame(tt)
> labeltext <- cbind(c("Dataset",datasetList),c(rep(mybigspace,length(datasetList)+1)))
> bs <- rep(0.5, nrow(labeltext))

```

```

> r.mean <- c(NA,tt$cindex)
> r.lower <- c(NA,tt$lower)
> r.upper <- c(NA,tt$upper)
> forestplot.surv(labeltext=labeltext, mean=r.mean, lower=r.lower, upper=r.upper, zero=
+   align=c("l"), graphwidth=grid::unit(2, "inches"), x.ticks=seq(0.4,0.75,0.05), xl
+   col=meta.colors(box="royalblue", line="darkblue", zero="darkred"), box.size=bs, c

```

More advanced displaying of the genes AURKA and VEGF in a single forestplot with different colors and labels is possible:

```

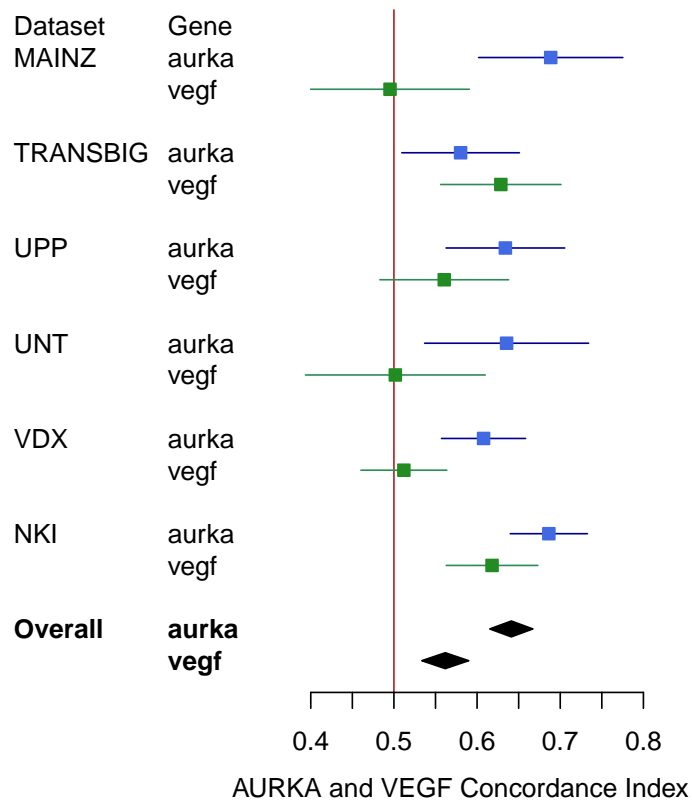

> tt <- rbind(cindexall.mainz.small[3,],
+   cindexall.mainz.small[5,],
+   NA,
+   cindexall.transbig.small[3,],
+   cindexall.transbig.small[5,],
+   NA,
+   cindexall.upp.small[3,],
+   cindexall.upp.small[5,],

```

```

+         NA,
+         cindexall.unt.small[3,],
+         cindexall.unt.small[5,],
+         NA,
+         cindexall.vdx.small[3,],
+         cindexall.vdx.small[5,],
+         NA,
+         cindexall.nki.small[3,],
+         cindexall.nki.small[5,],
+         NA,
+         as.numeric(ccindex[3,]),
+         as.numeric(ccindex[5,]))
> rownames(tt) <- c("MAINZa", "MAINZv", "a", "TRANSBIGa", "TRANSBIGv", "b", "UPPa", "UPPv", "UPPa", "UPPv")
> tt <- as.data.frame(tt)
> labeltext <- cbind(c("Dataset", "MAINZ", NA, NA, "TRANSBIG", NA, NA, "UPP", NA, NA, "UPP", NA, NA),
+                   c("Gene", rep(c("aurka", "vegf", NA), length(datasetList)-2), c("aurka", "vegf", NA)))
> bs <- rep(0.5, nrow(labeltext))
> r.mean <- c(NA, tt$cindex)
> r.lower <- c(NA, tt$lower)
> r.upper <- c(NA, tt$upper)
> forestplot.surv(labeltext=labeltext, mean=r.mean, lower=r.lower, upper=r.upper, zero=0,
+   align=c("l"), graphwidth=grid::unit(2, "inches"), x.ticks=seq(0.4, 0.8, 0.05), xlab="Survival",
+   col=meta.colors(line=c(rep(c(NA, "darkblue", "seagreen"), 7)), zero="firebrick", bty="n",
+   clip=c(0.3, 1), is.summary=(c(rep(FALSE, 19), TRUE, TRUE)))

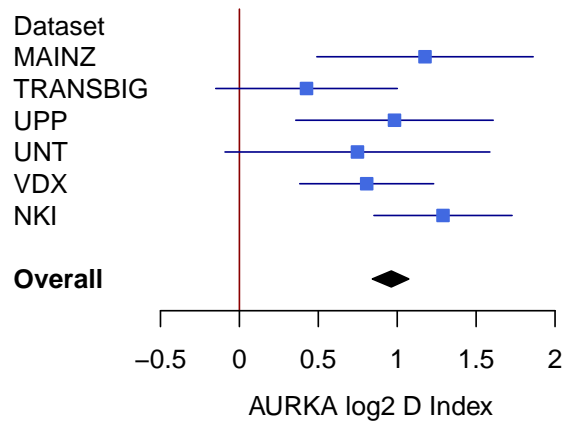

```

We display the D indices for both genes in each dataset and the combined estimation over all datasets in the same way.

```
> tt <- rbind(dindexall.mainz.small[3,],
+            dindexall.transbig.small[3,],
+            dindexall.upp.small[3,],
+            dindexall.unt.small[3,],
+            dindexall.vdx.small[3,],
+            dindexall.nki.small[3,],
+            NA,
+            as.numeric(cdindex[3,]))
> rownames(tt) <- datasetList
> tt <- as.data.frame(tt)
> labeltext <- cbind(c("Dataset", datasetList), c(rep(mybigspace, length(datasetList)+1)))
> bs <- rep(0.5, nrow(labeltext))
> r.mean <- c(NA, log2(tt$dindex))
> r.lower <- c(NA, log2(tt$lower))
> r.upper <- c(NA, log2(tt$upper))
```

```
> forestplot.surv(labeltext=labeltext, mean=r.mean, lower=r.lower, upper=r.upper, zero=
+   align=c("l"), graphwidth=grid::unit(2, "inches"), x.ticks=seq(-0.5,2,0.5), xlab=
+   col=meta.colors(box="royalblue", line="darkblue", zero="darkred"), box.size=bs, c
```

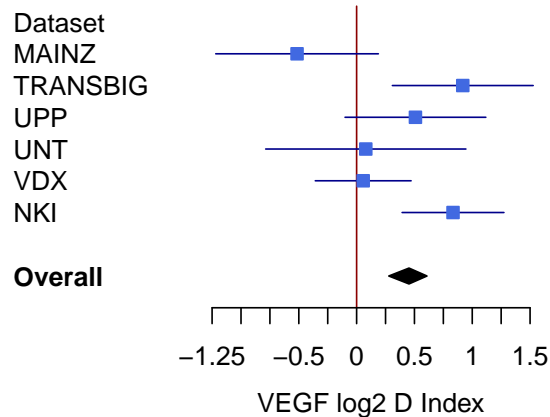

```
> tt <- rbind(dindexall.mainz.small[5,],
+   dindexall.transbig.small[5,],
+   dindexall.upp.small[5,],
+   dindexall.unt.small[5,],
+   dindexall.vdx.small[5,],
+   dindexall.nki.small[5,],
+   NA,
+   as.numeric(cdindex[5,]))
> rownames(tt) <- datasetList
> tt <- as.data.frame(tt)
> labeltext <- cbind(c("Dataset",datasetList),c(rep(mybigspace,length(datasetList)+1)))
> bs <- rep(0.5, nrow(labeltext))
> r.mean <- c(NA,log2(tt$dindex))
```

```

> r.lower <- c(NA,log2(tt$lower))
> r.upper <- c(NA,log2(tt$upper))
> forestplot.surv(labeltext=labeltext, mean=r.mean, lower=r.lower, upper=r.upper, zero=
+   align=c("l"), graphwidth=grid::unit(2, "inches"), x.ticks=seq(-1.25,1.5,0.25), xl
+   col=meta.colors(box="royalblue", line="darkblue", zero="darkred"), box.size=bs, c

```

And at last the hazard ratio for the gene AURKA in each dataset and the combined estimation over all datasets.

```

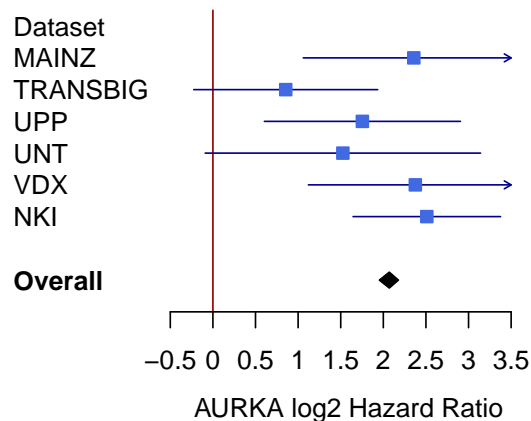

> tt <- rbind(hratio.mainz.small[3,],
+   hratio.transbig.small[3,],
+   hratio.upp.small[3,],
+   hratio.unt.small[3,],
+   hratio.vdx.small[3,],
+   hratio.nki.small[3,],
+   NA,
+   as.numeric(chratio[3,]))
> rownames(tt) <- datasetList

```

```

> tt <- as.data.frame(tt)
> labeltext <- cbind(c("Dataset",datasetList),c(rep(myspace,length(datasetList)+1)))
> bs <- rep(0.5, nrow(labeltext))
> r.mean <- c(NA,log2(tt$hratio))
> r.lower <- c(NA,log2(tt$lower))
> r.upper <- c(NA,log2(tt$upper))
> forestplot.surv(labeltext=labeltext, mean=r.mean, lower=r.lower, upper=r.upper, zero=
+   align=c("l"), graphwidth=grid::unit(2, "inches"), x.ticks=seq(-0.5,3.5,0.5), xlab=
+   col=meta.colors(box="royalblue", line="darkblue", zero="darkred"), box.size=bs, c

```

The following small loop shows an easy way for creating several forestplots showing the concordance indices for a single gene for all datasets and the combined estimation over all datasets. The same can be done for the D indices and hazard ratios. Since it is not yet possible to combine several forestplots in one figure (e.g. with `par(mfrow=c(2,2))`), we don't display the results of the following loop.

```

> for(i in 1:length(gsList)) {
+   tt <- rbind(cindexall.mainz.small[i,],

```

```

+         cindexall.transbig.small[i,],
+         cindexall.upp.small[i,],
+         cindexall.unt.small[i,],
+         cindexall.vdx.small[i,],
+         cindexall.nki.small[i,],
+         NA,
+         as.numeric(ccindex[i,]))
+
+ rownames(tt) <- datasetList
+ tt <- as.data.frame(tt)
+ labeltext <- cbind(c("Dataset",datasetList), c(rep(myspace,length(datasetList)+1)))
+ bs <- rep(0.5, nrow(labeltext))

```

2.5 Kaplan Meier survival curves

To display a Kaplan Meier curve [8] for all datasets you can use:

```

> surv.data <- censor.time(surv.time=c(pData(mainz7g)[ , "t.dmfs"], pData(transbig7g)[ , "t.dmfs"]),
> gg <- factor(c(rep("mainz", nrow(pData(mainz7g))), rep("transbig", nrow(pData(transbig7g)))))
> dd <- data.frame("time"=surv.data[[1]], "event"=surv.data[[2]], "group"=gg)
> km.coxph.plot(formula.s=formula(Surv(time, event) ~ group), data.s=dd, sub.s="all", xlab="Time", ylab="Survival")

```

No. At Risk													
mainz	200	191	179	171	159	153	130	107	86	76	60		
transbig	198	195	185	175	166	154	151	146	136	132	123		
unt	125	119	112	101	93	86	76	68	61	48	38		
vdx	344	324	292	267	252	231	207	184	136	89	53		
upp	234	223	208	195	188	177	167	159	152	146	134		
nki	319	305	278	249	232	213	179	148	118	94	77		

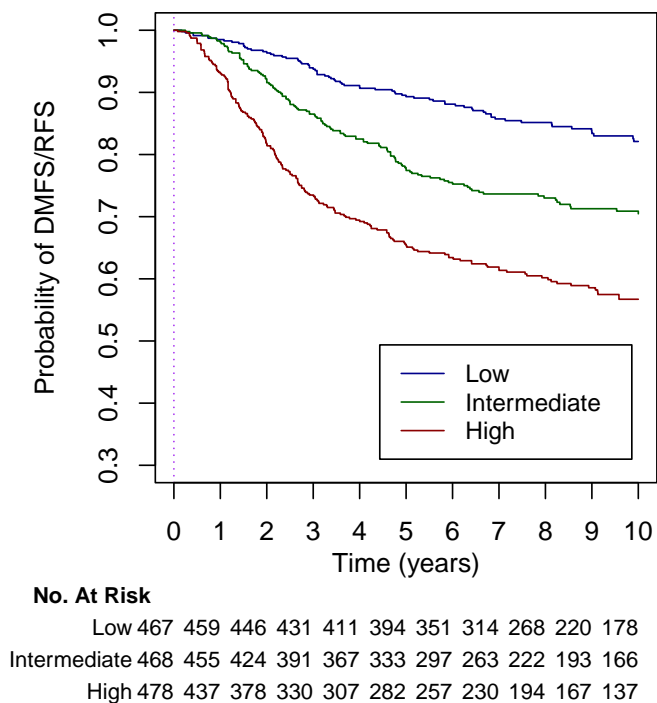

If you want to display the survival curve for a single gene using the data of all six datasets, we have to concatenate the survival and expression data of all datasets (see `surv.time.all`, `surv.event.all` and `aurka.exprs` below). After that we split the patients in each dataset into three parts according to their gene expression. We use the function `quantile()` for that. In the end we have three groups, representing the low gene expression group (lowest 33% of the gene expression), intermediate gene expression group (gene expression between 33% and 66%) and high gene expression group (over 66%).

```
> aurkaGs <- "AURKA"
> aurkaGid <- 6790
> aurkaPaf <- "208079_s_at"
> aurkaPagi <- "NM_003600"
> surv.time.all <- c(pData(mainz7g)[ , "t.dmfs"], pData(transbig7g)[ , "t.dmfs"], pData(unt7g)[ , "t.dmfs"],
> surv.event.all <- c(pData(mainz7g)[ , "e.dmfs"], pData(transbig7g)[ , "e.dmfs"], pData(unt7g)[ , "e.dmfs"],
> aurka.exprs <- c(exprs(mainz7g)[aurkaPaf,], exprs(transbig7g)[aurkaPaf,], exprs(unt7g)[aurkaPaf,],
> aurka.exprs.length <- c(length( exprs(mainz7g)[aurkaPaf,] ), length( exprs(transbig7g)[aurkaPaf,] ),
> pos <- 0
```

```

> mygroup <- NULL
> for(i in aurka.exprs.length){
+   qq <- aurka.exprs[(pos+1):(pos+i)]
+   myq <- quantile(qq, probs=c(0.33, 0.66), na.rm=TRUE)
+   qq[aurka.exprs[(pos+1):(pos+i)] < myq[1]] <- 1
+   qq[aurka.exprs[(pos+1):(pos+i)] >= myq[1] & aurka.exprs[(pos+1):(pos+i)] < myq[2]]
+   qq[aurka.exprs[(pos+1):(pos+i)] > myq[2]] <- 3
+   qq <- factor(x=qq, levels=1:3)
+   mygroup <- c(mygroup,qq)
+   pos <- pos + i
+ }
> surv.data <- censor.time(surv.time=surv.time.all / 365, surv.event=surv.event.all, ti
> dd <- data.frame("time"=surv.data[[1]], "event"=surv.data[[2]], "gg"=mygroup)
> gg <- factor(c(rep("mainz", nrow(pData(mainz7g))), rep("transbig", nrow(pData(transbi
> km.coxph.plot(formula.s=formula(Surv(time, event) ~ gg), data.s=dd, sub.s="all", x.la

```

2.6 Meta analysis of estimation values

The *SurvComp* package integrates functions for meta-analysis of risk-prediction models, e.g. for the concordance index or the D index. The following example shows the `cindex.comp.meta()` function [9]. Table 6 shows the p-values representing the difference between the cindices of two genes using the cindices of all six datasets. For example, the cindex of the gene AURKA is with a p-value of 0.00001 significantly different from the cindex of the gene VEGF using the six datasets.

```
> cindexMetaMainz <- t(apply(X=exprs(mainz7g), MARGIN=1, function(x, y, z) {
+   tt <- concordance.index(x=x, surv.time=y, surv.event=z, method="noether", na.rm=T)
+   return(tt); }, y=pData(mainz7g)[, "t.dmfs"], z=pData(mainz7g)[, "e.dmfs"]))
> cindexMetaTransbig <- t(apply(X=exprs(transbig7g), MARGIN=1, function(x, y, z) {
+   tt <- concordance.index(x=x, surv.time=y, surv.event=z, method="noether", na.rm=T)
+   return(tt); }, y=pData(transbig7g)[, "t.dmfs"], z=pData(transbig7g)[, "e.dmfs"]))
> cindexMetaUpp <- t(apply(X=exprs(upp7g), MARGIN=1, function(x, y, z) {
+   tt <- concordance.index(x=x, surv.time=y, surv.event=z, method="noether", na.rm=T)
+   return(tt); }, y=pData(upp7g)[, "t.rfs"], z=pData(upp7g)[, "e.rfs"]))
> cindexMetaUnt <- t(apply(X=exprs(unt7g), MARGIN=1, function(x, y, z) {
+   tt <- concordance.index(x=x, surv.time=y, surv.event=z, method="noether", na.rm=T)
+   return(tt); }, y=pData(unt7g)[, "t.dmfs"], z=pData(unt7g)[, "e.dmfs"]))
> cindexMetaVdx <- t(apply(X=exprs(vdx7g), MARGIN=1, function(x, y, z) {
+   tt <- concordance.index(x=x, surv.time=y, surv.event=z, method="noether", na.rm=T)
+   return(tt); }, y=pData(vdx7g)[, "t.dmfs"], z=pData(vdx7g)[, "e.dmfs"]))
> ccNki <- complete.cases(exprs(nki7g)[1,], exprs(nki7g)[2,], exprs(nki7g)[3,], exprs(nki7g)[4,], exprs(nki7g)[5,], exprs(nki7g)[6,])
> cindexMetaNki <- t(apply(X=exprs(nki7g)[ccNki,], MARGIN=1, function(x, y, z) {
+   tt <- concordance.index(x=x, surv.time=y, surv.event=z, method="noether", na.rm=T)
+   return(tt); }, y=pData(nki7g)[ccNki, "t.dmfs"], z=pData(nki7g)[ccNki, "e.dmfs"]))
> ccmData <- tt <- rr <- NULL
> for(i in 1:7){
+   tt <- NULL
+   listOne <- list("mainz"= cindexMetaMainz[[i]],
+                 "transbig" = cindexMetaTransbig[[i]],

FUNCTION	DESCRIPTION
D.index	Function to compute the D index
breastCancerData	Sample data containing six datasets for gene expression, annotations and clinical data
sensor.time	Function to artificially censor survival data
cindex.comp	Function to compare two concordance indices
cindex.comp.meta	Function to compare two concordance indices
combine.est	Function to combine estimates
combine.test	Function to combine probabilities
concordance.index	Function to compute the cindex for survival or binary class prediction
cvpl	Function to compute the CVPL
dindex.comp	Function to compare two D indices
dindex.comp.meta	Function to compare two D indices
fisherz	Function to compute Fisher z transformation
forestplot.surv	Forest plots enables to display performance estimates of survival models
getsurv2	Function to retrieve the survival probabilities at a specific point in time
hazard.ratio	Function to estimate the hazard ratio through Cox regression
hr.comp	Function to statistically compare two hazard ratios
hr.comp.meta	Function to compare two concordance indices
hr.comp2	Function to statistically compare two hazard ratios (alternative interface)
iauc.comp	Function to compare two IAUCs through time-dependent ROC curves
ibsc.comp	Function to compare two IBSCs
km.coxph.plot	Function to plot several Kaplan-Meier survival curves
logpl	Function to compute the log partial likelihood of a Cox model
metaplot.surv	Meta plots enables to display performance estimates of survival models
no.at.risk	Function to compute the number of individuals at risk
sbrier.score2proba	Function to compute the BSCs from a risk score, for all the times of event occurrence
score2proba	Function to compute the survival probabilities from a risk score
survcomp-package	Performance Assessment and Comparison for Survival Analysis
td.sens.spec	Function to compute sensitivity and specificity for a binary classification of survival data
tdrocc	Function to compute time-dependent ROC curves
test.hetero.est	Function to test the heterogeneity of set of probabilities
test.hetero.test	Function to test the heterogeneity of set of probabilities
