

# Package ‘gwasurvivr’

January 17, 2022

**Type** Package

**Title** gwasurvivr: an R package for genome wide survival analysis

**Version** 1.13.0

**Author** Abbas Rizvi, Ezgi Karaesmen, Martin Morgan, Lara Sucheston-Campbell

**Maintainer** Abbas Rizvi <aarizv@gmail.com>

**Description** gwasurvivr is a package to perform survival analysis using Cox proportional hazard models on imputed genetic data.

**VignetteBuilder** knitr

**Imports** GWASTools, survival, VariantAnnotation, parallel, matrixStats, SummarizedExperiment, stats, utils, SNPRelate

**Suggests** BiocStyle, knitr, rmarkdown

**Depends** R (>= 3.4.0)

**License** Artistic-2.0

**URL** <https://github.com/suchestoncampbelllab/gwasurvivr>

**biocViews** GenomeWideAssociation, Survival, Regression, Genetics, SNP, GeneticVariability, Pharmacogenomics, BiomedicalInformatics

**RoxygenNote** 6.1.0

**Encoding** UTF-8

**git\_url** <https://git.bioconductor.org/packages/gwasurvivr>

**git\_branch** master

**git\_last\_commit** 990c5ab

**git\_last\_commit\_date** 2021-10-26

**Date/Publication** 2022-01-17

## R topics documented:

michiganCoxSurv . . . . .	6
plinkCoxSurv . . . . .	8
sangerCoxSurv . . . . .	10

---

gdsCoxSurv	<i>Fit Cox survival to all variants from a standard IMPUTE2 output after genotype imputation</i>
------------	--

---

### Description

Performs survival analysis using Cox proportional hazard models on imputed genetic data from GDS files.

### Usage

```
gdsCoxSurv(gdsfile, covariate.file, id.column, sample.ids = NULL,
           time.to.event, event, covariates, inter.term = NULL,
           print.covs = "only", out.file, chunk.size = 5000,
           maf.filter = 0.05, flip.dosage = TRUE, verbose = TRUE,
           clusterObj = NULL)
```

### Arguments

gdsfile	path to .gds file. Location of the .gds file should also contain .snprdata and .scanrdata files.
covariate.file	data.frame comprising phenotype information, all covariates to be added in the model must be numeric.
id.column	character giving the name of the ID column in covariate.file.
sample.ids	character vector of sample IDs to keep in survival analysis
time.to.event	character of column name in covariate.file that represents the time interval of interest in the analysis
event	character of column name in covariate.file that represents the event of interest to be included in the analysis
covariates	character vector with exact names of columns in covariate.file to include in analysis
inter.term	character string giving the column name of the covariate that will be added to the interaction term with SNP (e.g. term*SNP). See details.
print.covs	character string of either "only", "all" or "some", defining which covariate statistics should be printed to the output. See details.
out.file	character of output file name (do not include extension)
chunk.size	integer number of variants to process per thread
maf.filter	numeric to filter minor allele frequency (i.e. choosing 0.05 means filtering MAF>0.05). User can set this to NULL if no filtering is preferred. Default is 0.05.
flip.dosage	logical to flip which allele the dosage was calculated on, default flip.dosage=TRUE
verbose	logical for messages that describe which part of the analysis is currently being run
clusterObj	A cluster object that can be used with the parApply function. See details.

## Details

Testing for SNP-covariate interactions: User can define the column name of the covariate that will be included in the interaction term. For example, for given covariates a and b, where c is defined as the `inter.term` the model will be:  $\sim a + b + c + \text{SNP} + c * \text{SNP}$ .

Printing results of other covariates: `print.covs` argument controls the number of covariates will be printed as output. The function is set to only by default and will only print the SNP or if an interaction term is given, the results of the interaction term (e.g. `SNP*covariate`). Whereas, `all` will print results (`coef`, `se.coef`, `p.value` etc) of all covariates included in the model. `some` is only applicable if an interaction term is given and will print the results for SNP, covariate tested for interaction and the interaction term. User should be mindful about using the `all` option, as it will likely slow down the analysis and will increase the output file size.

User defined parallelization: This function uses `parApply` from `parallel` package to fit models to SNPs in parallel. User is not required to set any options for the parallelization. However, advanced users who wish to optimize it, can provide a cluster object generated by `makeCluster` family of functions that suits their need and platform.

## Value

Saves two text files directly to disk: `.coxph` extension containing CoxPH survival analysis results. `.snps_removed` extension containing SNPs that were removed due to low variance or user-defined thresholds.

## Examples

```
gdsfile <- system.file(package="gwasurvivr",
                      "extdata",
                      "gds_example.gds")
covariate.file <- system.file(package="gwasurvivr",
                             "extdata",
                             "simulated_pheno.txt")
covariate.file <- read.table(covariate.file,
                           sep=" ",
                           header=TRUE,
                           stringsAsFactors = FALSE)
covariate.file$SexFemale <- ifelse(covariate.file$sex=="female", 1L, 0L)
sample.ids <- covariate.file[covariate.file$group=="experimental",]$ID_2
gdsCoxSurv(gdsfile=gdsfile,
          covariate.file=covariate.file,
          id.column="ID_2",
          sample.ids=sample.ids,
          time.to.event="time",
          event="event",
          covariates=c("age", "SexFemale", "DrugTxYes"),
          inter.term=NULL,
          print.covs="only",
          out.file="impute_example",
          chunk.size=50,
          maf.filter=0.005,
          flip.dosage=TRUE,
          verbose=TRUE,
```

```
clusterObj=NULL)
```

---

impute2CoxSurv	<i>Fit Cox survival to all variants from a standard IMPUTE2 output after genotype imputation</i>
----------------	--

---

### Description

Performs survival analysis using Cox proportional hazard models on imputed genetic data from IMPUTE2 output

### Usage

```
impute2CoxSurv(impute.file, sample.file, chr, covariate.file, id.column,
  sample.ids = NULL, time.to.event, event, covariates,
  inter.term = NULL, print.covs = "only", out.file,
  chunk.size = 10000, maf.filter = 0.05, exclude.snps = NULL,
  flip.dosage = TRUE, verbose = TRUE, clusterObj = NULL,
  keepGDS = FALSE)
```

### Arguments

impute.file	character of IMPUTE2 file
sample.file	character of sample file affiliated with IMPUTE2 file
chr	numeric denoting chromosome number
covariate.file	data.frame comprising phenotype information, all covariates to be added in the model must be numeric.
id.column	character giving the name of the ID column in covariate.file.
sample.ids	character vector of sample IDs to keep in survival analysis
time.to.event	character of column name in covariate.file that represents the time interval of interest in the analysis
event	character of column name in covariate.file that represents the event of interest to be included in the analysis
covariates	character vector with exact names of columns in covariate.file to include in analysis
inter.term	character string giving the column name of the covariate that will be added to the interaction term with SNP (e.g. term*SNP). See details.
print.covs	character string of either "only", "all" or "some", defining which covariate statistics should be printed to the output. See details.
out.file	character of output file name (do not include extension)
chunk.size	integer number of variants to process per thread

<code>maf.filter</code>	numeric to filter minor allele frequency (i.e. choosing 0.05 means filtering MAF>0.05). User can set this to NULL if no filtering is preferred. Default is 0.05.
<code>exclude.snps</code>	a character vector listing the rsIDs of SNPs that will be excluded from analyses
<code>flip.dosage</code>	logical to flip which allele the dosage was calculated on, default <code>flip.dosage=TRUE</code>
<code>verbose</code>	logical for messages that describe which part of the analysis is currently being run
<code>clusterObj</code>	A cluster object that can be used with the <code>parApply</code> function. See details.
<code>keepGDS</code>	logical to keep GDS files (compressed IMPUTE2 files) after the analysis. Defaults to FALSE.

## Details

Testing for SNP-covariate interactions: User can define the column name of the covariate that will be included in the interaction term. For example, for given covariates `a` and `b`, where `c` is defined as the `inter.term` the model will be:  $\sim a + b + c + \text{SNP} + c * \text{SNP}$ .

Printing results of other covariates: `print.covs` argument controls the number of covariates will be printed as output. The function is set to only by default and will only print the SNP or if an interaction term is given, the results of the interaction term (e.g. `SNP*covariate`). Whereas, `all` will print results (`coef`, `se.coef`, `p.value` etc) of all covariates included in the model. `some` is only applicable if an interaction term is given and will print the results for SNP, covariate tested for interaction and the interaction term. User should be mindful about using the `all` option, as it will likely slow down the analysis and will increase the output file size.

User defined parallelization: This function uses `parApply` from `parallel` package to fit models to SNPs in parallel. User is not required to set any options for the parallelization. However, advanced users who wish to optimize it, can provide a cluster object generated by `makeCluster` family of functions that suits their need and platform.

## Value

Saves two text files directly to disk: `.coxph` extension containing CoxPH survival analysis results. `.snps_removed` extension containing SNPs that were removed due to low variance or user-defined thresholds.

## Examples

```
impute.file <- system.file(package="gwasurvivr",
                           "extdata",
                           "impute_example.impute2.gz")
sample.file <- system.file(package="gwasurvivr",
                            "extdata",
                            "impute_example.impute2_sample")
covariate.file <- system.file(package="gwasurvivr",
                              "extdata",
                              "simulated_pheno.txt")
covariate.file <- read.table(covariate.file,
                            sep=" ",
                            header=TRUE,
```

```

                                stringsAsFactors = FALSE)
covariate.file$SexFemale <- ifelse(covariate.file$sex=="female", 1L, 0L)
sample.ids <- covariate.file[covariate.file$group=="experimental",]$ID_2
impute2CoxSurv(impute.file=impute.file,
               sample.file=sample.file,
               chr=14,
               covariate.file=covariate.file,
               id.column="ID_2",
               sample.ids=sample.ids,
               time.to.event="time",
               event="event",
               covariates=c("age", "SexFemale", "DrugTxYes"),
               inter.term=NULL,
               print.covs="only",
               out.file="impute_example",
               chunk.size=50,
               maf.filter=0.005,
               exclude.snps=NULL,
               flip.dosage=TRUE,
               verbose=TRUE,
               clusterObj=NULL,
               keepGDS=FALSE)

```

---

michiganCoxSurv

*Fit Cox survival to all variants in a .vcf.gz file from Michigan imputation server*

---

## Description

Performs survival analysis using Cox proportional hazard models on imputed genetic data stored in compressed VCF files

## Usage

```

michiganCoxSurv(vcf.file, covariate.file, id.column, sample.ids = NULL,
               time.to.event, event, covariates, inter.term = NULL,
               print.covs = "only", out.file, maf.filter = 0.05, r2.filter = NULL,
               chunk.size = 5000, verbose = TRUE, clusterObj = NULL)

```

## Arguments

vcf.file	character(1) path to VCF file.
covariate.file	matrix(1) comprising phenotype (time, event) and additional covariate data.
id.column	character(1) providing exact match to sample ID column from covariate.file
sample.ids	character vector with sample ids to include in analysis
time.to.event	character(1) string that matches time column name in pheno.file
event	character(1) string that matches event column name in pheno.file

<code>covariates</code>	character vector with matching column names in pheno.file of covariates of interest
<code>inter.term</code>	character(1) string giving the column name of the covariate that will be added to the interaction term with SNP (e.g. <code>term*SNP</code> ). See details.
<code>print.covs</code>	character(1) string of either "only", "all" or "some", defining which covariate statistics should be printed to the output. See details.
<code>out.file</code>	character(1) string with output name
<code>maf.filter</code>	integer(1) filter out minor allele frequency below threshold (i.e. 0.005 will filter $MAF > 0.005$ )
<code>r2.filter</code>	integer(1) of imputation quality score filter (i.e. 0.7 will filter $r2 > 0.7$ )
<code>chunk.size</code>	integer(1) number of variants to process per thread
<code>verbose</code>	logical(1) for messages that describe which part of the analysis is currently being run
<code>clusterObj</code>	A cluster object that can be used with the <code>parApply</code> function. See details.

## Details

Testing for SNP-covariate interactions: User can define the column name of the covariate that will be included in the interaction term. For example, for given covariates `a` and `b`, where `c` is defined as the `inter.term` the model will be:  $\sim a + b + c + SNP + c*SNP$ .

Printing results of other covariates: `print.covs` argument controls the number of covariates will be printed as output. The function is set to `only` by default and will only print the SNP or if an interaction term is given, the results of the interaction term (e.g. `SNP*covariate`). Whereas, `all` will print results (`coef`, `se.coef`, `p.value` etc) of all covariates included in the model. `some` is only applicable if an interaction term is given and will print the results for SNP, covariate tested for interaction and the interaction term. User should be mindful about using the `all` option, as it will likely slow down the analysis and will increase the output file size.

User defined parallelization: This function uses `parApply` from `parallel` package to fit models to SNPs in parallel. User is not required to set any options for the parallelization. However, advanced users who wish to optimize it, can provide a cluster object generated by `makeCluster` family of functions that suits their need and platform.

## Value

Saves two text files directly to disk: `.coxph` extension containing CoxPH survival analysis results. `.snps_removed` extension containing SNPs that were removed due to low variance or user-defined thresholds.

## Examples

```
vcf.file <- system.file(package="gwasurvivr",
                        "extdata",
                        "michigan.chr14.dose.vcf.gz")
pheno.fl <- system.file(package="gwasurvivr",
                       "extdata",
                       "simulated_pheno.txt")
pheno.file <- read.table(pheno.fl,
```

```

        sep=" ",
        header=TRUE,
        stringsAsFactors = FALSE)
pheno.file$SexFemale <- ifelse(pheno.file$sex=="female", 1L, 0L)
sample.ids <- pheno.file[pheno.file$group=="experimental",]$ID_2
michiganCoxSurv(vcf.file=vcf.file,
                covariate.file=pheno.file,
                id.column="ID_2",
                sample.ids=sample.ids,
                time.to.event="time",
                event="event",
                covariates=c("age", "SexFemale", "DrugTxYes"),
                inter.term=NULL,
                print.covs="only",
                out.file="michigan_example",
                r2.filter=0.3,
                maf.filter=0.005,
                chunk.size=50,
                verbose=TRUE,
                clusterObj=NULL)

```

---

plinkCoxSurv	<i>Fit Cox survival to all variants from PLINK binary files (.BED, .BIM, .FAM)</i>
--------------	--

---

### Description

Performs survival analysis using Cox proportional hazard models on directly typed data in PLINK format

### Usage

```

plinkCoxSurv(bed.file, covariate.file, id.column, sample.ids = NULL,
             time.to.event, event, covariates, inter.term = NULL,
             print.covs = "only", out.file, chunk.size = 10000,
             maf.filter = 0.005, flip.dosage = TRUE, verbose = TRUE,
             clusterObj = NULL)

```

### Arguments

bed.file	character of name of plink files without extension
covariate.file	data.frame comprising phenotype information, all covariates to be added in the model must be numeric.
id.column	character giving the name of the ID column in covariate.file.
sample.ids	character vector of sample IDs to keep in survival analysis
time.to.event	character of column name in covariate.file that represents the time interval of interest in the analysis

<code>event</code>	character of column name in covariate.file that represents the event of interest to be included in the analysis
<code>covariates</code>	character vector with exact names of columns in covariate.file to include in analysis
<code>inter.term</code>	character string giving the column name of the covariate that will be added to the interaction term with SNP (e.g. <code>term*SNP</code> ). See details.
<code>print.covs</code>	character string of either "only", "all" or "some", defining which covariate statistics should be printed to the output. See details.
<code>out.file</code>	character of output file name (do not include extension)
<code>chunk.size</code>	integer number of variants to process per thread
<code>maf.filter</code>	numeric to filter minor allele frequency (i.e. choosing 0.05 means filtering $MAF > 0.05$ ). User can set this to NULL if no filtering is preferred. Default is 0.05.
<code>flip.dosage</code>	logical to flip which allele the dosage was calculated on, default <code>flip.dosage=TRUE</code>
<code>verbose</code>	logical for messages that describe which part of the analysis is currently being run
<code>clusterObj</code>	A cluster object that can be used with the <code>parApply</code> function. See details.

### Details

Testing for SNP-covariate interactions: User can define the column name of the covariate that will be included in the interaction term. For example, for given covariates *a* and *b*, where *c* is defined as the `inter.term` the model will be:  $\sim a + b + c + SNP + c*SNP$ .

Printing results of other covariates: `print.covs` argument controls the number of covariates will be printed as output. The function is set to `only` by default and will only print the SNP or if an interaction term is given, the results of the interaction term (e.g. `SNP*covariate`). Whereas, `all` will print results (`coef`, `se.coef`, `p.value` etc) of all covariates included in the model. `some` is only applicable if an interaction term is given and will print the results for SNP, covariate tested for interaction and the interaction term. User should be mindful about using the `all` option, as it will likely slow down the analysis and will increase the output file size.

User defined parallelization: This function uses `parApply` from `parallel` package to fit models to SNPs in parallel. User is not required to set any options for the parallelization. However, advanced users who wish to optimize it, can provide a cluster object generated by `makeCluster` family of functions that suits their need and platform.

            time.to.event="time",
            event="event",
            covariates=c("age", "SexFemale", "DrugTxYes"),
            inter.term=NULL,
            print.covs="only",
            out.file="impute_example",
            chunk.size=50,
            maf.filter=0.005,
            flip.dosage=TRUE,
            verbose=TRUE,
            clusterObj=NULL)

```

---

sangerCoxSurv

*Fit Cox survival to all variants in a .vcf.gz file from Sanger imputation server*

---

## Description

Performs survival analysis using Cox proportional hazard models on imputed genetic data stored in compressed VCF files.

## Usage

```

sangerCoxSurv(vcf.file, covariate.file, id.column, sample.ids = NULL,
             time.to.event, event, covariates, inter.term = NULL,
             print.covs = "only", out.file, maf.filter = 0.05,
             info.filter = NULL, chunk.size = 5000, verbose = TRUE,
             clusterObj = NULL)

```

## Arguments

vcf.file            character(1) path to VCF file.  
covariate.file    matrix(1) comprising phenotype (time, event) and additional covariate data.  
id.column         character(1) providing exact match to sample ID column from covariate.file

<code>sample.ids</code>	character vector with sample ids to include in analysis
<code>time.to.event</code>	character(1) string that matches time column name in pheno.file
<code>event</code>	character(1) string that matches event column name in pheno.file
<code>covariates</code>	character vector with matching column names in pheno.file of covariates of interest
<code>inter.term</code>	character(1) string giving the column name of the covariate that will be added to the interaction term with SNP (e.g. <code>term*SNP</code> ). See details.
<code>print.covs</code>	character(1) string of either "only", "all" or "some", defining which covariate statistics should be printed to the output. See details.
<code>out.file</code>	character(1) string with output name
<code>maf.filter</code>	integer(1) filter out minor allele frequency below threshold (i.e. 0.005 will filter $MAF > 0.005$ )
<code>info.filter</code>	integer(1) of imputation quality score filter (i.e. 0.7 will filter $info > 0.7$ )
<code>chunk.size</code>	integer(1) number of variants to process per thread
<code>verbose</code>	logical(1) for messages that describe which part of the analysis is currently being run
<code>clusterObj</code>	A cluster object that can be used with the <code>parApply</code> function. See details.

## Details

Testing for SNP-covariate interactions: User can define the column name of the covariate that will be included in the interaction term. For example, for given covariates *a* and *b*, where *c* is defined as the `inter.term` the model will be:  $\sim a + b + c + \text{SNP} + c * \text{SNP}$ .

Printing results of other covariates: `print.covs` argument controls the number of covariates will be printed as output. The function is set to `only` by default and will only print the SNP or if an interaction term is given, the results of the interaction term (e.g. `SNP*covariate`). Whereas, `all` will print results (`coef`, `se.coef`, `p.value` etc) of all covariates included in the model. `some` is only applicable if an interaction term is given and will print the results for SNP, covariate tested for interaction and the interaction term. User should be mindful about using the `all` option, as it will likely slow down the analysis and will increase the output file size.

User defined parallelization: This function uses `parApply` from `parallel` package to fit models to SNPs in parallel. User is not required to set any options for the parallelization. However, advanced users who wish to optimize it, can provide a cluster object generated by `makeCluster` family of functions that suits their need and platform.

## Value

Saves two text files directly to disk: `.coxph` extension containing CoxPH survival analysis results. `.snps_removed` extension containing SNPs that were removed due to low variance or user-defined thresholds.

## Examples

```
vcf.file <- system.file(package="gwasurvivr",
                        "extdata",
```

```
      "sanger.pbwt_reference_impute.vcf.gz")
pheno.fl <- system.file(package="gwasurvivr",
  "extdata",
  "simulated_pheno.txt")
pheno.file <- read.table(pheno.fl,
  sep=" ",
  header=TRUE,
  stringsAsFactors = FALSE)
pheno.file$SexFemale <- ifelse(pheno.file$sex=="female", 1L, 0L)
sample.ids <- pheno.file[pheno.file$group=="experimental",]$ID_2
sangerCoxSurv(vcf.file=vcf.file,
  covariate.file=pheno.file,
  id.column="ID_2",
  sample.ids=sample.ids,
  time.to.event="time",
  event="event",
  covariates=c("age", "SexFemale", "DrugTxYes"),
  inter.term=NULL,
  print.covs="only",
  out.file="sanger_example",
  info.filter=0.3,
  maf.filter=0.005,
  chunk.size=50,
  verbose=TRUE,
  clusterObj=NULL)
```
