Package ‘CBNplot’

March 27, 2024

Type Package
Title plot bayesian network inferred from gene expression data based on enrichment analysis results
Version 1.2.1
Description This package provides the visualization of bayesian network inferred from gene expression data. The networks are based on enrichment analysis results inferred from packages including clusterProfiler and ReactomePA. The networks between pathways and genes inside the pathways can be inferred and visualized.

CBNplot-package  CBNplot: plot bayesian network inferred from gene expression data based on enrichment analysis results

Description

This package provides the visualization of bayesian network inferred from gene expression data. The networks are based on enrichment analysis results inferred from packages including clusterProfiler and ReactomePA. The networks between pathways and genes inside the pathways can be inferred and visualized.

Details

[CBNplot::bngeneplot()] - The main function using gene expression data within the pathway to infer Bayesian network. [CBNplot::bnpathplot()] - The main function using pathway expression data, which is defined by eigengene of the gene expression values to infer Bayesian network. [CBNplot::bngeneplotCustom()] - The function that provides custom visualization for the gene network. [CBNplot::bnpathplotCustom()] - The function that provides custom visualization for the pathway network.

Description

Plot gene relationship within the specified pathway

Usage

bngeneplot(
  results,
  exp,
  expSample = NULL,
  algo = "hc",
  R = 20,
  returnNet = FALSE,
  algorithm.args = NULL,
  bypassConverting = FALSE,
  edgeLink = FALSE,
  pathNum = NULL,
  convertSymbol = TRUE,
  expRow = "ENSEMBL",
  interactive = FALSE,
  cexCategory = 1,
  cl = NULL,
  showDir = FALSE,
  chooseDir = FALSE,
  scoreType = "bic-g",
  labelSize = 4,
  layout = "nicely",
  clusterAlpha = 0.2,
  strType = "normal",
  delZeroDegree = TRUE,
  otherVar = NULL,
  otherVarName = NULL,
  onlyDf = FALSE,
  disc = FALSE,
tr = NULL,
remainCont = NULL,
sp = "hsapiens",
compareRef = FALSE,
compareRefType = "intersection",
pathDb = "reactome",
depl = NULL,
depMeta = NULL,
sizeDep = FALSE,
showDepHist = TRUE,
cellLineName = "5637_URINARY_TRACT",
showLineage = FALSE,
orgDb = org.Hs.eg.db,
shadowText = TRUE,
bgColor = "white",
textColor = "black",
strengthPlot = FALSE,
nStrength = 10,
strThresh = NULL,
hub = NULL,
seed = 1,
useSiGN = FALSE
)

Arguments

results the enrichment analysis result
exp gene expression matrix
expSample candidate samples to be included in the inference default to all
algo structure learning method used in boot.strength() default to "hc"
R the number of bootstrap
returnNet whether to return the network
algorithm.args parameters to pass to bnlearn structure learning function
bypassConverting bypass the symbol converting If you use custom annotation databases that does not have SYMBOL listed in keys. ID of rownames and those listed in EA result must be same.
edgeLink use geom_edge_link() instead of geom_edge_diagonal()
pathNum the pathway number (the number of row of the original result, ordered by p-value)
convertSymbol whether the label of resulting network is converted to symbol, default to TRUE
expRow the type of the identifier of rows of expression matrix
interactive whether to use bnviewer (default to FALSE)
cexCategory scaling factor of size of nodes
cl cluster object from parallel::makeCluster()
showDir
chooseDir
scoreType
labelSize
layout
clusterAlpha
strType
deZer0Degree
otherVar
otherVarName
onlyDf
disc
tr
remainCont
sp
compareRef
cellLineName
showLineage
orgDb
shadowText
bgColor
textColor
strengthPlot
nStrength
strThresh
hub
seed
useSiGN

display the confidence of direction of edges
if undirected edges are present, choose direction of edges (default: FALSE)
 score type to use on choosing direction
the size of label of the nodes
ggraph layout, default to "nicely"
if specified multiple pathways, the parameter is passed to geom_mark_hull()
"normal" or "ms" for multiscale implementation
delete zero degree nodes
other variables to be included in the inference
the names of other variables
return only data.frame used for inference
discretize the expression data
Specify data.frame if one needs to discretize as the same parameters as the other dataset
Specify characters when perform discretization, if some columns are to be remain continuous
query to graphite::pathways(), default to "hsapiens"
whether compare to the reference network
"intersection" or "difference"
query to graphite::pathways(), default to "reactome"
the tibble storing dependency score from library depmap
depmap::depmap_metadata(), needed for showLineage
whether to reflect DepMap score to the node size
whether to show depmap histogram
the cell line name to be included
show the dependency score across the lineage
perform clusterProfiler::setReadable based on this organism database
whether to use shadow text for the better readability default: TRUE
color for text background when shadowText is TRUE
color for text when shadowText is TRUE
append the barplot depicting edges with high strength
specify how many edges are included in the strength plot
the threshold for strength
visualize the genes with top-n hub scores
A random seed to make the analysis reproducible, default is 1.
default to FALSE. For using SiGN-BN in the function in Windows 10/11, 1.
Download the SiGN-BN HC+BS binary in WSL (https://sign.hgc.jp/signbn/download.html)
2. Set PATH to executable (sign.1.8.3)
Value

ggplot2 object

Examples

data("exampleEaRes");data("exampleGeneExp")
res <- bngeneplot(results = exampleEaRes, exp = exampleGeneExp, pathNum = 1,
R = 10, convertSymbol = TRUE, expRow = "ENSEMBL")

Description

Plot gene relationship within the specified pathway using customized theme

Usage

bngeneplotCustom(
  results,
  exp,
  expSample = NULL,
  algo = "hc",
  R = 20,
  pathNum = NULL,
  convertSymbol = TRUE,
  expRow = "ENSEMBL",
  interactive = FALSE,
  cexCategory = 1,
  cl = NULL,
  showDir = FALSE,
  chooseDir = FALSE,
  algorithm.args = NULL,
  labelSize = 4,
  layout = "nicely",
  strType = "normal",
  returnNet = FALSE,
  otherVar = NULL,
  otherVarName = NULL,
  onlyDf = FALSE,
  disc = FALSE,
  tr = NULL,
  remainCont = NULL,
  dep = NULL,
  sizeDep = FALSE,
  orgDb = org.Hs.eg.db,
bngeneplotCustom

bypassConverting = FALSE,
edgeLink = FALSE,
cellLineName = "5637_URINARY_TRACT",
fontFamily = "sans",
strengthPlot = FALSE,
nStrength = 10,
strThresh = NULL,
hub = NULL,
glowEdgeNum = NULL,
nodePal = c("blue", "red"),
edgePal = c("blue", "red"),
textCol = "black",
titleCol = "black",
backCol = "white",
barTextCol = "black",
barPal = c("red", "blue"),
barBackCol = "white",
scoreType = "bic-g",
barLegendKeyCol = "white",
barAxisCol = "black",
bg.colour = NULL,
bg.r = 0.1,
barPanelGridCol = "black",
titleSize = 24,
seed = 1
)

Arguments

results the enrichment analysis result
exp gene expression matrix
expSample candidate rows to be included in the inference default to all
algo structure learning method used in boot.strong() default to "hc"
R the number of bootstrap
pathNum the pathway number (the number of row of the original result, ordered by p-value)
convertSymbol whether the label of resulting network is converted to symbol, default to TRUE
expRow the type of the identifier of rows of expression matrix
interactive whether to use bnviewer (default to FALSE)
cexCategory scaling factor of size of nodes
cl cluster object from parallel::makeCluster()
showDir show the confidence of direction of edges
chooseDir if undirected edges are present, choose direction of edges
algorithm.args parameters to pass to bnlearn structure learning function
labelSize the size of label of the nodes
layout: ggraph layout, default to "nicely"
strType: "normal" or "ms" for multiscale implementation
returnNet: whether to return the network
otherVar: other variables to be included in the inference
otherVarName: the names of other variables
onlyDf: return only data.frame used for inference
disc: discretize the expression data
tr: Specify data.frame if one needs to discretize as the same parameters as the other dataset
remainCont: Specify characters when perform discretization, if some columns are to be remain continuous
dep: the tibble storing dependency score from library depmap
sizeDep: whether to reflect DepMap score to the node size
orgDb: perform clusterProfiler::setReadable based on this organism database
bypassConverting: bypass the symbol converting ID of rownames and those listed in EA result must be same
dg: use geom_edge_link() instead of geom_edge_diagonal()
cellLineName: the cell line name to be included
fontFamily: font family name to be used for plotting
strengthPlot: append the barplot depicting edges with high strength
nStrength: specify how many edges are included in the strength plot
strThresh: the threshold for strength
hub: visualize the genes with top-n hub scores
glowEdgeNum: edges with top-n confidence of direction are highlighted
nodePal: vector of coloring of nodes (low, high)
edgePal: vector of coloring of edges (low, high)
textCol: color of texts in network plot
titleCol: color of title in network plot
backCol: color of background in network plot
barTextCol: text color in barplot
barPal: bar color
barBackCol: background color in barplot
scoreType: score type to use on inference
barLegendKeyCol: legend key color in barplot
barAxisCol: axis color in barplot
bg.colour: parameter to pass to geom_node_text
bg.r: parameter to pass to geom_node_text
barPanelGridCol: panel grid color in barplot
titleSize: the size of title
seed: A random seed to make the analysis reproducible, default is 1.
Value

ggplot2 object

Examples

data("exampleEaRes"); data("exampleGeneExp")
res <- bngeneplotCustom(results = exampleEaRes, exp = exampleGeneExp,
                         pathNum = 1, glowEdgeNum = NULL, hub = 3, R = 40,
                         fontFamily = "sans")

Description

Testing various R for bayesian network between genes

Usage

bngenetest(
  results,
  exp,
  expSample = NULL,
  algo = "hc",
  Rrange = seq(2, 40, 2),
  cl = NULL,
  algorithm.args = NULL,
  pathNum = NULL,
  convertSymbol = TRUE,
  expRow = "ENSEMBL",
  scoreType = "aic-g",
  orgDb = org.Hs.eg.db,
  bypassConverting = FALSE
)

Arguments

results the enrichment analysis result
exp gene expression matrix
expSample candidate rows to be included in the inference default to all
algo structure learning method used in boot.strength() default to "hc"
Rrange the sequence of R values to be tested
cl cluster object from parallel::makeCluster()
algorithm.args parameters to pass to bnlearn structure learning function
pathNum the pathway number (the number of row of the original result, ordered by p-value)
convertSymbol whether the label of resulting network is converted to symbol, default to TRUE
expRow the type of the identifier of rows of expression matrix
scoreType return the specified scores
orgDb perform clusterProfiler::setReadable based on this organism database
bypassConverting bypass symbol converting

Value
list of graphs and scores

Examples
```
data("exampleEaRes");data("exampleGeneExp")
res <- bngenetest(results = exampleEaRes, exp = exampleGeneExp,
      algo="hc", Rrange=seq(10, 30, 10), pathNum=1, scoreType="bge")
```

Description
Plot pathway relationship

Usage
```
bpathplot (result,
      exp,
      expSample = NULL,
      algo = "hc",
      algorithm.args = NULL,
      expRow = "ENSEMBL",
      cl = NULL,
      returnNet = FALSE,
      otherVar = NULL,
      otherVarName = NULL,
      qvalueCutOff = 0.05,
      adjpCutOff = 0.05,
      nCategory = 15,
      R = 20,
      interactive = FALSE,
      color = "p.adjust",
      cexCategory = 1
```
bnpathplot

cexLine = 0.5,
chooseDir = FALSE,
showDir = FALSE,
delZeroDegree = TRUE,
labelSize = 4,
layout = "nicely",
onlyDf = FALSE,
disc = FALSE,
tr = NULL,
remainCont = NULL,
shadowText = TRUE,
bgColor = "white",
textColor = "black",
compareRef = FALSE,
strThresh = NULL,
strType = "normal",
hub = NULL,
scoreType = "bic-g",
databasePal = "Set2",
dep = NULL,
sizeDep = FALSE,
orgDb = org.Hs.eg.db,
bypassConverting = FALSE,
useSiGN = FALSE,
edgeLink = TRUE,
cellLineName = "5637_URINARY_TRACT",
strengthPlot = FALSE,
nStrength = 10,
seed = 1
)

Arguments

results the enrichment analysis result
exp gene expression matrix
expSample candidate rows to be included in the inference default to all
algo structure learning method used in boot.strength() default to "hc"
algorithm.args parameters to pass to bnlearn structure learning function
expRow the type of the identifier of rows of expression matrix
cl cluster object from parallel::makeCluster()
returnNet whether to return the network
otherVar other variables to be included in the inference
otherVarName the names of other variables
qvalueCutOff the cutoff value for qvalue
adjpCutOff the cutoff value for adjusted pvalues
nCategory: the number of pathways to be included
R: the number of bootstrap
interactive: whether to use bnviewer (default to FALSE)
color: color of node, default to adjusted p-value
cexCategory: scaling factor of size of nodes
cexLine: scaling factor of width of edges
chooseDir: if undirected edges are present, choose direction of edges
showDir: show the confidence of direction of edges
delZeroDegree: delete zero degree nodes
labelSize: the size of label of the nodes
layout: ggraph layout, default to "nicely"
onlyDf: return only data.frame used for inference
disc: discretize the expression data
tr: Specify data.frame if one needs to discretize as the same parameters as the other dataset
remainCont: Specify characters when perform discretization, if some columns are to be remain continuous
shadowText: whether to use shadow text for the better readability (default: TRUE)
bgColor: color for text background when shadowText is TRUE
textColor: color for text when shadowText is TRUE
compareRef: whether compare to the reference network between pathway
strThresh: threshold for strength, automatically determined if NULL
strType: "normal" or "ms" for multiscale implementation
hub: change the shape of node according to hub scores (default NULL)
scoreType: score type to use on choosing edge direction
databasePal: palette to be used in scale_color_brewer when the multiple results are to be shown
dep: the tibble storing dependency score from the library depmap
sizeDep: whether to reflect DepMap score to the node size
orgDb: perform clusterProfiler::setReadable based on this organism database
bypassConverting: bypass the symbol converting. If you use custom annotation databases that does not have SYMBOL listed in keys. ID of rownames and those listed in EA result must be same.
useSiGN: default to FALSE. For using SiGN-BN in the function in Windows 10/11, 1. Download the SiGN-BN HC+BS binary in WSL (https://sign.hgc.jp/signbn/download.html) 2. Set PATH to executable (sign.1.8.3)
edgelink: whether to set edge to geom_edge_link() FALSE to use geom_edge_diagonal()
cellLineName: the cell line name to be included
strengthPlot: append the barplot depicting edges with high strength
nStrength: specify how many edges are included in the strength plot
seed: A random seed to make the analysis reproducible, default is 1.
`bnpathplotCustom`  

**Value**  

`ggplot2` object

**Examples**  

```r  
data("exampleEaRes"); data("exampleGeneExp")  
res <- bnpathplot(results = exampleEaRes, exp = exampleGeneExp,  
                 R = 10, expRow = "ENSEMBL")  
```  

**Description**  

Plot pathway relationship using customized theme

**Usage**  

```r  
bnpathplotCustom(  
  results,  
  exp,  
  expSample = NULL,  
  algo = "hc",  
  R = 20,  
  expRow = "ENSEMBL",  
  color = "p.adjust",  
  cexCategory = 1,  
  cl = NULL,  
  showDir = FALSE,  
  chooseDir = FALSE,  
  labelSize = 4,  
  layout = "nicely",  
  strType = "normal",  
  compareRef = FALSE,  
  disc = FALSE,  
  tr = NULL,  
  remainCont = NULL,  
  qvalueCutOff = 0.05,  
  adjpCutOff = 0.05,  
  nCategory = 15,  
  cexLine = 1,  
  returnNet = FALSE,  
  dep = NULL,  
  sizeDep = FALSE,  
  cellLineName = "5637_URINARY_TRACT",  
  fontFamily = "sans",  
)  
```
otherVar = NULL,
otherVarName = NULL,
onlyDf = FALSE,
algorithm.args = NULL,
strengthPlot = FALSE,
nStrength = 10,
edgeLink = FALSE,
strThresh = NULL,
hub = NULL,
glowEdgeNum = NULL,
nodePal = c("blue", "red"),
edgePal = c("blue", "red"),
textCol = "black",
backCol = "white",
barTextCol = "black",
barPal = c("red", "blue"),
barBackCol = "white",
scoreType = "bic-g",
barLegendKeyCol = "white",
orgDb = org.Hs.eg.db,
barAxisCol = "black",
barPanelGridCol = "black",
bg.colour = NULL,
bg.r = 0.1,
seed = 1,
bypassConverting = FALSE
)

Arguments

results the enrichment analysis result
exp gene expression matrix
expSample candidate rows to be included in the inference default to all
algo structure learning method used in boot.strength() default to "hc"
R the number of bootstrap
expRow the type of the identifier of rows of expression matrix
color color of node, default to adjusted p-value
cexCategory scaling factor of size of nodes
cl cluster object from parallel::makeCluster()
showDir show the confidence of direction of edges
chooseDir if undirected edges are present, choose direction of edges
labelSize the size of label of the nodes
layout ggraph layout, default to "nicely"
strType "normal" or "ms" for multiscale implementation
compareRef whether compare to the reference network between pathway
**bnpathplotCustom**

- **disc**: discretize the expression data
- **tr**: Specify data.frame if one needs to discretize as the same parameters as the other dataset
- **remainCont**: Specify characters when perform discretization, if some columns are to be remain continuous
- **qvalueCutOff**: the cutoff value for qvalue
- **adjpCutOff**: the cutoff value for adjusted pvalues
- **nCategory**: the number of pathways to be included
- **cexLine**: scaling factor of width of edges
- **returnNet**: whether to return the network
- **dep**: the tibble storing dependency score from library depmap
- **sizeDep**: whether to reflect DepMap score to the node size
- **cellLineName**: the cell line name to be included
- **fontFamily**: font family name to be used for plotting
- **otherVar**: other variables to be included in the inference
- **otherVarName**: the names of other variables
- **onlyDf**: return only data.frame used for inference
- **algorithm.args**: parameters to pass to bnlearn structure learning function
- **strengthPlot**: append the barplot depicting edges with high strength
- **nStrength**: specify how many edges are included in the strength plot
- **edgeLink**: use geom_edge_link() instead of geom_edge_diagonal()
- **strThresh**: threshold for strength, automatically determined if NULL
- **hub**: change the shape of node according to hub scores (default NULL)
- **glowEdgeNum**: edges with top-n confidence of direction are highlighted
- **nodePal**: vector of coloring of nodes (low, high)
- **edgePal**: vector of coloring of edges (low, high)
- **textCol**: color of texts in network plot
- **backCol**: color of background in network plot
- **barTextCol**: text color in barplot
- **barPal**: bar color
- **barBackCol**: background color in barplot
- **scoreType**: score type to use on inference
- **barLegendKeyCol**: legend key color in barplot
- **orgDb**: perform clusterProfiler::setReadable based on this organism database
- **barAxisCol**: axis color in barplot
- **barPanelGridCol**: panel grid color in barplot
bg.colour  
parameter to pass to geom_node_text

bg.r  
parameter to pass to geom_node_text

seed  
A random seed to make the analysis reproducible, default is 1.

bypassConverting  
bypass the symbol converting ID of rownames and those listed in EA result must be same

Value

ggplot2 object

Examples

data("exampleEaRes"); data("exampleGeneExp")
res <- bnpathplotCustom(results=exampleEaRes, exp=exampleGeneExp,
   fontFamily="sans", glowEdgeNum=3, hub=3)

bnpathtest

bnpathtest

Description

Testing various R for bayesian network between pathways

Usage

bnpathtest(
   results,  
   exp,  
   expSample = NULL,  
   algo = "hc",  
   algorithm.args = NULL,  
   expRow = "ENSEMBL",  
   cl = NULL,  
   orgDb = org.Hs.eg.db,  
   bypassConverting = FALSE,  
   qvalueCutOff = 0.05,  
   adjpCutOff = 0.05,  
   nCategory = 15,  
   Rrange = seq(2, 40, 2),  
   scoreType = "aic-g"  
)
Arguments
results the enrichment analysis result
exp gene expression matrix
expSample candidate rows to be included in the inference default to all
algo structure learning method used in boot.strength() default to "hc"
algorithm.args parameters to pass to bnlearn structure learning function
expRow the type of the identifier of rows of expression matrix
cl cluster object from parallel::makeCluster()
orgDb perform clusterProfiler::setReadable based on this organism database
bypassConverting bypass symbol converting
qvalueCutOff the cutoff value for qvalue
adjpCutOff the cutoff value for adjusted pvalues
nCategory the number of pathways to be included
Rrange the sequence of R values to be tested
scoreType return the specified scores

Value
list of graphs and scores

Examples
data("exampleEaRes");data("exampleGeneExp")
res <- bnpathtest(results = exampleEaRes, exp = exampleGeneExp,
                  algo="hc", Rrange=seq(10, 30, 10), expRow = "ENSEMBL",
                  scoreType="bge")

Description
Take the list of networks and returns the F-measures

Usage
compareBNs(listOfNets)

Arguments
listOfNets list of networks
Value

F-measures of each combination of network

Examples

data("exampleEaRes"); data("exampleGeneExp")
net1 <- bngeneplot(results = exampleEaRes,
  exp = exampleGeneExp, pathNum = 1, R = 10, returnNet=TRUE)
net2 <- bngeneplot(results = exampleEaRes,
  exp = exampleGeneExp, pathNum = 1, R = 10, returnNet=TRUE)
res <- compareBNs(list(net1$av, net2$av))

data("exampleEaRes")

Example enrichment analysis result

Description

An example enrichment analysis result to be used for testing purpose. The result was produced by running ReactomePA::enrichPathway() and subsequent clusterProfiler::setReadable() on ‘exampleGeneExp’.

Usage

data(exampleEaRes)

Format

An object of class enrichResult with 47 rows and 9 columns.

Value

example enrichment analysis result

data("exampleGeneExp")

Example gene expression data

Description

An example gene expression data to be used for testing purpose made by runif() for ERCC genes and 100 samples. No biological meanings can be obtained from the data.

Usage

data(exampleGeneExp)
Format

An object of class data.frame with 7 rows and 100 columns.

Value

example gene expression

Description

multiscale bootstrap-based inference of Bayesian network

Usage

inferMS(data, algo, algorithm.args, R, cl = NULL, r = seq(0.5, 1.5, 0.1))

Arguments

data  data.frame to perform inference
algo  structure learning method used in boot.strength()
algorithm.args parameters to pass to bnlearn structure learning function
R     the number of bootstrap
cl    cluster object from parallel::makeCluster()
r     vector for size of each bootstrap replicate

Value

object of class bn.strength

Description

Load the output of SiGN-BN (HC+BS)

Usage

loadSign(fileName)

Arguments

fileName the result of SiGN-BN
queryCpDistLs

**Value**

list of edges, nodes, strength, and bn (bnlearn)

---

**obtainPath**

**Description**

obtain the analysis results including the queried gene symbol

**Usage**

obtainPath(res, geneSymbol)

**Arguments**

- res: enrichment analysis result
- geneSymbol: the candidate gene

**Value**

subset of enrichment results

**Examples**

data("exampleEaRes")
obtainPath(res = exampleEaRes, geneSymbol="ERCC7")

---

queryCpDistLs

**Description**

produce a plot of bnlearn::cpdist by performing bnlearn::cpdist on specified node, evidence and level.

**Usage**

queryCpDistLs(fitted, candidate, evidences, discPalette = "Set2", ...)

**Arguments**

- fitted: bn.fit object
- candidate: name of node
- evidences: the evidences
- discPalette: palette to be used for plotting if the event is discrete
- ...: other parameters passed to bnlearn cpdist
queryCpDistLw

Value

list of dataframe containing raw values

Examples

library(bnlearn)
data("exampleEaRes")
data("exampleGeneExp")
net <- bngeneplot(exampleEaRes, exampleGeneExp,
                   pathNum=1, returnNet=TRUE)
fitted <- bn.fit(net$av, net$df)
res <- queryCpDistLs(fitted, candidate="ERCC4",
                     evidences=c("ERCC2<0.1","ERCC2>0.5","ERCC2>0.8"), n=500)

Description

produce a plot of bnlearn::cpdist by performing bnlearn::cpdist on specified node, evidence and level.

Usage

queryCpDistLw(
  fitted, 
  candidate, 
  evidence, 
  levels, 
  point = FALSE, 
  pointSize = 5, 
  alpha = TRUE, 
  ...
)

Arguments

fitted bn.fit object
candidate name of node
evidence evidence variable name
levels level to be listed
point geom_point the weighted mean
pointSize point size for geom_point
alpha whether to reflect the weights by alpha (TRUE) or color (FALSE)
... other parameters passed to bnlearn cpdist
queryCpDistLw

Value

list of dataframe containing raw values

Examples

library(bnlearn)
data("exampleEaRes")
data("exampleGeneExp")
net <- bngeneplot(exampleEaRes, exampleGeneExp,
pathNum=1, returnNet=TRUE)
fitted <- bn.fit(net$av, net$df)
res <- queryCpDistLw(fitted, candidate="ERCC4", evidence="ERCC2",
levels=c(0.1, 0.5, 0.8), n=500)
