Package ‘DEGreport’

April 1, 2024

Version 1.38.5
Date 2023-12-06
Type Package
Title Report of DEG analysis
Description Creation of a HTML report of differential expression analyses of count data. It integrates some of the code mentioned in DESeq2 and edgeR vignettes, and report a ranked list of genes according to the fold changes mean and variability for each selected gene.
biocViews DifferentialExpression, Visualization, RNASeq, ReportWriting, GeneExpression, ImmunoOncology

Description

These functions are provided for compatibility with older versions of DEGreport only and will be defunct at the next release.

Details

The following functions are deprecated and will be made defunct; use the replacement indicated below:

- `degRank`, `degPR`, `degBIcmd`, `degBI`, `degFC`, `degComb`, `degNcomb`: DESeq2::lcfShrink. This function was trying to avoid big FoldChange in variable genes. There are other methods nowadays like lcfShrink function. DEGreport

Useful links:

createReport

Create report of RNAseq DEG analysis

Description

This function get the count matrix, pvalues, and FC of a DEG analysis and create a report to help to detect possible problems with the data.

Usage

createReport(g, counts, tags, pvalues, path, pop = 400, name = "DEGreport")

Arguments

g Character vector with the group the samples belong to.
counts Matrix with counts for each samples and each gene. Should be same length than pvalues vector.
tags Genes of DEG analysis
pvalues pvalues of DEG analysis
path path to save the figure
pop random genes for background
name name of the html file

Value

A HTML file with all figures and tables

deg

Method to get all table stored for an specific comparison

Description

Method to get all table stored for an specific comparison

Usage

deg(object, value = NULL, tidy = NULL, top = NULL, ...)

## S4 method for signature 'DEGSet'
deg(object, value = NULL, tidy = NULL, top = NULL, ...)
degCheckFactors

Arguments

object: DEGSet
value: Character to specify which table to use.
tidy: Return data.frame, tibble or original class.
top: Limit number of rows to return. Default: All.
... Other parameters to pass for other methods.

Author(s)

Lorena Pantano

References

- Testing if top is whole number or not comes from: https://stackoverflow.com/a/3477158

degCheckFactors: Distribution of gene ratios used to calculate Size Factors.

Description

This function check the median ratio normalization used by DESeq2 and similarly by edgeR to visually check whether the median is the best size factor to represent depth.

Usage

degCheckFactors(counts, each = FALSE)

Arguments

counts: Matrix with counts for each samples and each gene. row number should be the same length than pvalues vector.
each: Plot each sample separately.

Details

This function will plot the gene ratios for each sample. To calculate the ratios, it follows the similar logic than DESeq2/edgeR uses, where the expression of each gene is divided by the mean expression of that gene. The distribution of the ratios should approximate to a normal shape and the factors should be similar to the median of distributions. If some samples show different distribution, the factor may be bias due to some biological or technical factor.

Value

ggplot2 object
References

- Code to calculate size factors comes from \texttt{DESeq2::estimateSizeFactorsForMatrix()}. 

Examples

```r
data(humanGender)
library(SummarizedExperiment)
degCheckFactors(assays(humanGender)[[1]][, 1:10])
```

---

\textbf{degColors} \hspace{1cm} \textit{Make nice colors for metadata}

Description

The function will take a metadata table and use Set2 palette when number of levels is > 3 or a set or orange/blue colors otherwise.

Usage

```r
degColors(
  ann,
  col_fun = FALSE,
  con_values = c("grey80", "black"),
  cat_values = c("orange", "steelblue"),
  palette = "Set2"
)
```

Arguments

- \texttt{ann} \hspace{1cm} Data.frame with metadata information. Each column will be used to generate a palette suitable for the values in there.
- \texttt{col_fun} \hspace{1cm} Whether to return a function for continuous variables (compatible with \texttt{ComplexHeatmap::HeatmapAnnotation()}) or the colors themself (compatible with \texttt{[pheatmap::pheatmap()]})
- \texttt{con_values} \hspace{1cm} Color to be used for continuous variables.
- \texttt{cat_values} \hspace{1cm} Color to be used for 2-levels categorical variables.
- \texttt{palette} \hspace{1cm} Palette to use from \texttt{brewer.pal()} for multi-levels categorical variables.

Examples

```r
data(humanGender)
library(DESeq2)
library(ComplexHeatmap)
idx <- c(1:10, 75:85)
dse <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:10, idx],
  colData(humanGender)[idx,], design=~group)
```
th <- HeatmapAnnotation(df = colData(dse),
                         col = degColors(colData(dse), TRUE))
Heatmap(log2(counts(dse)+0.5), top_annotation = th)

custom <- degColors(colData(dse), TRUE,
                     con_values = c("white", "red"),
                     cat_values = c("white", "black"),
                     palette = "Set1")
th <- HeatmapAnnotation(df = colData(dse),
                         col = custom)
Heatmap(log2(counts(dse)+0.5), top_annotation = th)

degComps  Automatize the use of results() for multiple comparisons

Description

This function will extract the output of DESeq2::results() and DESeq2::lfcShrink() for multiple comparison using:

Usage

degComps(
  dds,
  combs = NULL,
  contrast = NULL,
  alpha = 0.05,
  skip = FALSE,
  type = "normal",
  pairs = FALSE,
  fdr = "default"
)

Arguments

dds  DESeq2::DESeqDataSet object.
combs  Optional vector indicating the coefficients or columns from colData(dds) to create group comparisons.
contrast  Optional vector to specify contrast. See DESeq2::results().
alpha  Numeric value used in independent filtering in DESeq2::results().
skip  Boolean to indicate whether skip shrinkage. For instance when it comes from LRT method.
type  Type of shrinkage estimator. See DESeq2::lfcShrink().
pairs  Boolean to indicate whether create all comparisons or only use the coefficient already created from DESeq2::resultsNames().
fdr  type of fdr correction. default is FDR value, lfdr-stat is for local FDR using the statistics of the test, lfdr-pvalue is for local FDR using the p-value of the test. fdrtools needs to be installed and loaded by the user
degCorCov

Calculate the correlation relationship among all covariates in the metadata table

Details

- coefficients
- contrast
- Multiple columns in colData that match coefficients
- Multiple columns in colData to create all possible contrasts

Value

DEGSet with unSrunken and Srunken results.

Author(s)

Lorena Pantano

Examples

```r
library(DESeq2)
dds <- makeExampleDESeqDataSet(betaSD=1)
colData(dds)[["condition"]]<- sample(colData(dds)[["condition"]], 12)
design(dds) <- ~ condition + treatment
dds <- DESeq(dds)
res <- degComps(dds, combs = c("condition", 2),
               contrast = list("treatment_B_vs_A", c("condition", "A", "B")))
# library(fdrtools)
#res <- degComps(dds,contrast = list("treatment_B_vs_A"),
#               fdr="lfdr-stat")
```

Description

This function will calculate the correlation among all columns in the metadata

Usage

`degCorCov(metadata, fdr = 0.05, use_pval = FALSE, ...)`

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metadata</td>
<td>data.frame with samples metadata.</td>
</tr>
<tr>
<td>fdr</td>
<td>numeric value to use as cutoff to determine the minimum fdr to consider significant correlations between pcs and covariates.</td>
</tr>
<tr>
<td>use_pval</td>
<td>boolean to indicate to use p-value instead of FDR to hide non-significant correlation.</td>
</tr>
<tr>
<td>...</td>
<td>Parameters to pass to ComplexHeatmap::Heatmap().</td>
</tr>
</tbody>
</table>
**Value**

: list: a) cor, data.frame with pair-wise correlations, pvalues, FDR b) corMat, data.frame with correlation matrix c) fdrMat, data.frame with FDR matrix b) plot, Heatmap plot of correlation matrix

**Author(s)**

: Lorena Pantano, Kenneth Daily and Thanneer Malai Perumal

**Examples**

```r
data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
dse <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx],
  colData(humanGender)[idx,, design=~group)
cor <- degCorCov(colData(dse))
```

---

**degCovariates**

*Find correlation between pcs and covariates*

**Description**

This function will calculate the pcs using prcomp function, and correlate categorical and numerical variables from metadata. The size of the dots indicates the importance of the metadata, for instance, when the range of the values is pretty small (from 0.001 to 0.002 in ribosomal content), the correlation results is not important. If black stroke lines are shown, the correlation analysis has a FDR < 0.05 for that variable and PC. Only significant variables according the linear model are colored. See details to know how this is calculated.

**Usage**

```r
degCovariates(
  counts,
  metadata,
  fdr = 0.1,
  scale = FALSE,
  minPC = 5,
  correlation = "kendall",
  addCovDen = TRUE,
  legacy = FALSE,
  smart = TRUE,
  method = "lm",
  plot = TRUE
)
```
Arguments

- **counts**: normalized counts matrix
- **metadata**: data.frame with samples metadata.
- **fdr**: numeric value to use as cutoff to determine the minimum fdr to consider significant correlations between pcs and covariates.
- **scale**: boolean to determine whether counts matrix should be scaled for pca. default FALSE.
- **minPC**: numeric value that will be used as cutoff to select only pcs that explain more variability than this.
- **correlation**: character determining the method for the correlation between pcs and covariates.
- **addCovDen**: boolean. Whether to add the covariates dendogram to the plot to see covariates relationship. It will show `degCorCov()` dendogram on top of the columns of the heatmap.
- **legacy**: boolean. Whether to plot the legacy version.
- **smart**: boolean. Whether to avoid normalization of the numeric covariates when calculating importance. This is not used if `legacy = TRUE`. See @details for more information.
- **method**: character. Whether to use `lm` to calculate the significance of the variable during reduction step. See @details for more information.
- **plot**: Whether to plot or not the correlation matrix.

Details

This method is adapted from Daily et al 2017 article. Principal components from PCA analysis are correlated with covariates metadata. Factors are transformed to numeric variables. Correlation is measured by `cor.test` function with Kendall method by default.

The size of the dot, or importance, indicates the importance of the covariate based on the range of the values. Covariates where the range is very small (like a % of mapped reads that varies between 0.001 to 0.002) will have a very small size (0.1*max_size). The maximum value is set to 5 units. To get to importance, each covariate is normalized using this equation: \(1 - \min(v/\max(v))\), and the minimum and maximum values are set to 0.01 and 1 respectively. For instance, 0.5 would mean there is at least 50% of difference between the minimum value and the maximum value. Categorical variables are plotted using the maximum size always, since it is not possible to estimate the variability. By default, it won’t do \(v/\max(v)\) if the values are already between 0-1 or 0-100 (already normalized values as rates and percentages). If you want to ignore the importance, use `legacy = TRUE`.

Finally, a linear model is used to calculate the significance of the covariates effect on the PCs. For that, this function uses `lm` to regress the data and uses the p-value calculated by each variable in the model to define significance (pvalue < 0.05). Variables with a black stroke are significant after this step. Variables with grey stroke are significant at the first pass considering p.value < 0.05 for the correlation analysis.

Value

: list:
- plot, heatmap showing the significance of the variables.
- corMatrix, correlation, p-value, FDR values for each covariate and PCA pairs.
- pcsMatrix: PCs loading for each sample.
- scatterPlot: plot for each significant covariate and the PC values.
- significants: contains the significant covariates using a linear model to predict the coefficient of covariates that have some color in the plot. All the significant covariates from the linear model analysis are returned.

library(DESeq2)
idx <- c(1:10, 75:85)
dse <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx],
colData(humanGender)[idx,], design=~group)
res <- degCovariates(log2(counts(dse)+0.5), colData(dse))
res <- degCovariates(log2(counts(dse)+0.5),
colData(dse), legacy = TRUE)
res$plot
res$scatterPlot[[1]]

degDefault

Method to get the default table to use.

Description

It can accept a list of new padj values matching the same dimensions than the current vector.

Usage

degDefault(object)

degCorrect(object, fdr)

## S4 method for signature 'DEGSet'
degDefault(object)

## S4 method for signature 'DEGSet'
degCorrect(object, fdr)
Arguments

object  DEGSet
fdr  It can be fdr-stat, fdr-pvalue, vector of new padj

Author(s)

Lorena Pantano

Examples

library(DESeq2)
library(dplyr)
dds <- makeExampleDESeqDataSet(betaSD=1)
colData(dds)[["treatment"]]<- sample(colData(dds)["condition"], 12)
design(dds) <- ~ condition + treatment
dds <- DESeq(dd)
res <- degComps(dd, contrast = list("treatment_B_vs_A"))

degFilter  Filter genes by group

Description

This function will keep only rows that have a minimum counts of 1 at least in a min number of samples (default 80%).

Usage

degFilter(counts, metadata, group, min = 0.8, minreads = 0)

Arguments

counts  Matrix with expression data, columns are samples and rows are genes or other feature.
metadata  Data.frame with information about each column in counts matrix. Rownames should match colnames(counts).
group  Character column in metadata used to group samples and applied the cutoff.
min  Percentage value indicating the minimum number of samples in each group that should have more than 0 in count matrix.
minreads  Integer minimum number of reads to consider a feature expressed.

Value

count matrix after filtering genes (features) with not enough expression in any group.
degMA

Examples

data(humanGender)
library(SummarizedExperiment)
idx <- c(1:10, 75:85)
c <- degFilter(assays(humanGender)[[1]][1:1000, idx],
    colData(humanGender)[idx,], "group", min=1)

---

degMA

MA-plot from base means and log fold changes

Description

MA-plot addaptation to show the shrinking effect.

Usage

degMA(
    results,
    title = NULL,
    label_points = NULL,
    label_column = "symbol",
    limit = NULL,
    diff = 5,
    raw = FALSE,
    correlation = FALSE
)

Arguments

results DEGSet class.
title Optional. Plot title.
label_points Optionally label these particular points.
label_column Match label_points to this column in the results.
limit Absolute maximum to plot on the log2FoldChange.
diff Minimum difference between logFoldChange before and after shrinking.
raw Whether to plot just the unshrunken log2FC.
correlation Whether to plot the correlation of the two logFCs.

Value

MA-plot ggplot.
Author(s)

Victor Barrera
Rory Kirchner
Lorena Pantano

Examples

```r
library(DESeq2)
dds <- makeExampleDESeqDataSet(betaSD=1)
dds <- DESeq(dds)
res <- degComps(dds, contrast = list("condition_B_vs_A"))
degMA(res)
```

degMB

Distribution of expression of DE genes compared to the background

Description

Distribution of expression of DE genes compared to the background

Usage

```
degMB(tags, group, counts, pop = 400)
```

Arguments

- `tags`: List of genes that are DE.
- `group`: Character vector with group name for each sample in the same order than counts column names.
- `counts`: Matrix with counts for each samples and each gene. Should be same length than pvalues vector.
- `pop`: number of random samples taken for background comparison

Value

`ggplot2` object

Examples

```r
data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
dds <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx],
colData(humanGender)[idx,], design=~group)
dds <- DESeq(dds)
res <- results(dds)
degMB(row.names(res)[1:20], colData(dds)["group"],
counts(dds, normalized = TRUE))
```
degMDS  

Plot MDS from normalized count data

Description

Uses cmdscale to get multidimensional scaling of data matrix, and plot the samples with ggplot2.

Usage

degMDS(counts, condition = NULL, k = 2, d = "euclidian", xi = 1, yi = 2)

Arguments

- counts: matrix samples in columns, features in rows
- condition: vector define groups of samples in counts. It has to be same order than the count matrix for columns.
- k: integer number of dimensions to get
- d: type of distance to use, c("euclidian", "cor").
- xi: number of component to plot in x-axis
- yi: number of component to plot in y-axis

Value

ggplot2 object

Examples

data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
dse <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx], colData(humanGender)[idx,], design=~group)
degMDS(counts(dse), condition = colData(dse)[["group"]])

degMean  

Distribution of pvalues by expression range

Description

This function plot the p-values distribution colored by the quantiles of the average count data.

Usage

degMean(pvalues, counts)
Arguments

- `pvalues`: pvalues of DEG analysis.
- `counts`: Matrix with counts for each samples and each gene. row number should be the same length than pvalues vector.

Value
ggplot2 object

Examples

```r
data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
dds <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx],
                              colData(humanGender)[idx,], design=~group)
dds <- DESeq(dds)
res <- results(dds)
degMean(res[, 4], counts(dds))
```

---

**degMerge**

*Integrate data coming from degPattern into one data object*

**Description**

The simplest case is if you want to combine the pattern profile for gene expression data and proteomic data. It will use the first element as the base for the integration. Then, it will loop through clusters and run `degPatterns` in the second data set to detect patterns that match this one.

**Usage**

```r
degMerge(
  matrix_list,
  cluster_list,
  metadata_list,
  summarize = "group",
  time = "time",
  col = "condition",
  scale = TRUE,
  mapping = NULL
)
```

**Arguments**

- `matrix_list`: list expression data for each element
- `cluster_list`: list df item from degPattern output
degMV

**metadata_list** list data.frames from each element with design experiment. Normally `colData` output

**summarize** character column to use to group samples

**time** character column to use as x-axes in figures

**col** character column to color samples in figures

**scale** boolean scale by row expression matrix

**mapping** data.frame mapping table in case elements use different ID in the row.names of expression matrix. For instance, when integrating miRNA/mRNA.

**Value**

A data.frame with information on what genes are in each cluster in all data set, and the correlation value for each pair cluster comparison.

---

**degMV**

*Correlation of the standard desviation and the mean of the abundance of a set of genes.*

**Description**

Correlation of the standard desviation and the mean of the abundance of a set of genes.

**Usage**

`degMV(group, pvalues, counts, sign = 0.01)`

**Arguments**

- **group** Character vector with group name for each sample in the same order than `counts` column names.
- **pvalues** pvalues of DEG analysis.
- **counts** Matrix with counts for each samples and each gene.
- **sign** Defining the cutoff to label significant features. row number should be the same length than `pvalues` vector.

**Value**

`ggplot2` object
Examples

data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
dds <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx],
   colData(humanGender)[idx,], design=~group)
dds <- DESeq(dds)
res <- results(dds)
dergMV(colData(dds)["group"],
   res[, 4],
   counts(dds, normalized = TRUE))

degObj

Create a deg object that can be used to plot expression values at shiny server:runGist(9930881)

Description

Create a deg object that can be used to plot expression values at shiny server:runGist(9930881)

Usage

degObj(counts, design, outfile)

Arguments

counts Output from get_rank function.
design Colour used for each gene.
outfile File that will contain the object.

Value

R object to be load into vizExp.

Examples

data(humanGender)
library(SummarizedExperiment)
degObj(assays(humanGender)[[1]], colData(humanGender), NULL)
degPatterns

Make groups of genes using expression profile.

Description

Note that this function doesn’t calculate significant difference between groups, so the matrix used as input should be already filtered to contain only genes that are significantly different or the most interesting genes to study.

Usage

degPatterns(
  ma,
  metadata,
  minc = 15,
  summarize = "merge",
  time = "time",
  col = NULL,
  consensusCluster = FALSE,
  reduce = FALSE,
  cutoff = 0.7,
  scale = TRUE,
  pattern = NULL,
  groupDifference = NULL,
  eachStep = FALSE,
  plot = TRUE,
  fixy = NULL,
  nClusters = NULL
)

Arguments

- **ma**: log2 normalized count matrix
- **metadata**: data frame with sample information. Rownames should match `ma` column names row number should be the same length than p-values vector.
- **minc**: integer minimum number of genes in a group that will be return
- **summarize**: character column name in metadata that will be used to group replicates. If the column doesn’t exist it’ll merge the `time` and the `col` columns, if `col` doesn’t exist it’ll use `time` only. For instance, a merge between `summarize` and `time` parameters: control_point0 ... etc
- **time**: character column name in metadata that will be used as variable that changes, normally a time variable.
- **col**: character column name in metadata to separate samples. Normally control/mutant
- **consensusCluster**: Indicates whether using ConsensusClusterPlus or cluster::diana()
reduce
boolean remove genes that are outliers of the cluster distribution. boxplot function is used to flag a gene in any group defined by time and col as outlier and it is removed from the cluster. Not used if consensusCluster is TRUE.

cutoff
This is deprecated.

scale
boolean scale the ma values by row

pattern
numeric vector to be used to find patterns like this from the count matrix. As well, it can be a character indicating the genes inside the count matrix to be used as reference.

groupDifference
Minimum abundance difference between the maximum value and minimum value for each feature. Please, provide the value in the same range than the ma value (if ma is in log2, groupDifference should be inside that range).

eachStep
Whether apply groupDifference at each stem over time variable. This only work properly for one group with multiple time points.

plot
boolean plot the clusters found

fixy
vector integers used as ylim in plot

nClusters
an integer scalar or vector with the desired number of groups

Details
It can work with one or more groups with 2 or more several time points. Before calculating the genes similarity among samples, all samples inside the same time point (time parameter) and group (col parameter) are collapsed together, and the mean value is the representation of the group for the gene abundance. Then, all pair-wise gene expression is calculated using cor.test R function using kendall as the statistical method. A distance matrix is created from those values. After that, cluster::diana() is used for the clustering of gene-gene distance matrix and cut the tree using the divisive coefficient of the clustering, giving as well by diana. Alternatively, if consensusCluster is on, it would use ConsensusClusterPlus to cut the tree in stable clusters. Finally, for each group of genes, only the ones that have genes higher than minc parameter will be added to the figure.

The y-axis in the figure is the results of applying scale() R function, what is similar to creating a Z-score where values are centered to the mean and scaled to the standard desviation by each gene.

The different patterns can be merged to get similar ones into only one pattern. The expression correlation of the patterns will be used to decide whether some need to be merged or not.

Value
list wiht two items:

- df is a data.frame with two columns. The first one with genes, the second with the clusters they belong.
- pass is a vector of the clusters that pass the minc cutoff.
- plot ggplot figure.
- hr clustering of the genes in hclust format.
- profile normalized count data used in the plot.
• raw data.frame with gene values summarized by biological replicates and with metadata information attached.

• summarise data.frame with clusters values summarized by group and with the metadata information attached.

• normalized data.frame with the clusters values as used in the plot.

• benchmarking plot showing the different patterns at different values for clustering cuttree function.

• benchmarking_curve plot showing how the numbers of clusters and genes changed at different values for clustering cuttree function.

Examples

```r
data(humanGender)
library(SummarizedExperiment)
library(ggplot2)
ma <- assays(humanGender)[[1]][1:100,]
des <- colData(humanGender)
des[["other"]] <- sample(c("a", "b"), 85, replace = TRUE)
res <- degPatterns(ma, des, time="group", col = "other")
# Use the data yourself for custom figures
ggplot(res["normalized"],
       aes(group, value, color = other, fill = other)) +
    geom_boxplot() +
    geom_point(position = position_jitterdodge(dodge.width = 0.9)) +
    # change the method to make it smoother
    geom_smooth(aes(group=other), method = "lm")
```

degPCA

smart PCA from count matrix data

Description

nice plot using ggplot2 from prcomp function

Usage

```r
degPCA(
  counts,
  metadata = NULL,
  condition = NULL,
  pc1 = "PC1",
  pc2 = "PC2",
  name = NULL,
  shape = NULL,
  data = FALSE
)
```
degPlot

Plot top genes allowing more variables to color and shape points

Description

Plot top genes allowing more variables to color and shape points

Usage

degPlot(
  dds,
  xs,
  res = NULL,
  n = 9,
  genes = NULL,
  group = NULL,
  batch = NULL,
)
degPlot

metadata = NULL,
ann = c("geneID", "symbol"),
slot = 1L,
log2 = TRUE,
xsLab = xs,
ysLab = "abundance",
color = "black",
groupLab = group,
batchLab = batch,
sizePoint = 1
)

Arguments

dds DESeq2::DESeqDataSet object or SummarizedExperiment or Matrix or data.frame. In case of a DESeqDataSet object, always the normalized expression will be used from counts(dds, normalized = TRUE).
xs Character, colname in colData that will be used as X-axes.
res DESeq2::DESeqResults object.
n Integer number of genes to plot from the res object. It will take the top N using padj values to order the table.
genes Character of gene names matching rownames of count data.
group Character, colname in colData to color points and add different lines for each level.
batch Character, colname in colData to shape points, normally used by batch effect visualization.
metadata Metadata in case dds is a matrix.
ann Columns in rowData (if available) used to print gene names. First element in the vector is the column name in rowData that matches the row.names of the dds or count object. Second element in the vector is the column name in rowData that it will be used as the title for each gene or feature figure.
slot Name of the slot to use to get count data.
log2 Whether to apply or not log2 transformation.
xsLab Character, alternative label for x-axis (default: same as xs)
ysLab Character, alternative label for y-axis..
color Color to use to plot groups. It can be one color, or a palette compatible with ggplot2::scale_color_brewer().
groupLab Character, alternative label for group (default: same as group).
batchLab Character, alternative label for batch (default: same as batch).
sizePoint Integer, indicates the size of the plotted points (default 1).

Value

ggplot showing the expresison of the genes
Examples

```r
data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
dse <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx],
    colData(humanGender)[idx,], design=~group)
dse <- DESeq(dse)
degPlot(dse, genes = rownames(dse)[1:10], xs = "group")
degPlot(dse, genes = rownames(dse)[1:10], xs = "group", color = "orange")
degPlot(dse, genes = rownames(dse)[1:10], xs = "group", group = "group",
    color = "Accent")
```

---

**degPlotCluster**

*Plot clusters from degPattern function output*

**Description**

This function helps to format the cluster plots from `degPatterns()`. It allows to control the layers and it returns a ggplot object that can accept more ggplot functions to allow customization.

**Usage**

```r
degPlotCluster(
    table,
    time,
    color = NULL,
    min_genes = 10,
    process = FALSE,
    points = TRUE,
    boxes = TRUE,
    smooth = TRUE,
    lines = TRUE,
    facet = TRUE,
    cluster_column = "cluster",
    prefix_title = "Group: "
)
```

**Arguments**

- `table`: normalized element from `degPatterns()` output. It can be a data.frame with the following columns in there: genes, sample, expression, cluster, xaxis_column, color_column.
- `time`: column name to use in the x-axis.
- `color`: column name to use to color and divide the samples.
- `min_genes`: minimum number of genes to be added to the plot.
- `process`: whether to process the table if it is not ready for plotting.
- `points`: Add points to the plot.

degPlotWide

boxes Add boxplot to the plot.
smooth Add regression line to the plot.
lines Add gene lines to the plot.
facet Split figures based on cluster ID.
cluster_column column name if cluster is in a column with a different name. Usefull, to plot cluster with different cutoffs used when grouping genes from the clustering step.

prefix_title text to add before the cluster ID in the figure title.

Value

`ggplot2` object.

Examples

data(humanGender)
library(SummarizedExperiment)
library(ggplot2)
ma <- assays(humanGender)[[1]][1:100,

res <- degPatterns(ma, des, time="group", col = "other", plot = FALSE)
degPlotCluster(res$normalized, "group", "other")

library(dplyr)
library(tidyr)
library(tibble)
table <- rownames_to_column(as.data.frame(ma), "genes") %>%
gather("sample", "expression", -genes) %>%
right_join(distinct(res$df[,c("genes", "cluster")]),
  by = "genes") %>%
left_join(rownames_to_column(as.data.frame(des), "sample"),
  by = "sample") %>%
as.data.frame()
degPlotCluster(table, "group", "other", process = TRUE)

degPlotWide                         Plot selected genes on a wide format

Description

Plot selected genes on a wide format

Usage

degPlotWide(counts, genes, group, metadata = NULL, batch = NULL)
**Arguments**

- **counts**: DESeq2::DESeqDataSet object or expression matrix
- **genes**: character genes to plot.
- **group**: character, colname in colData to color points and add different lines for each level
- **metadata**: data.frame, information for each sample. Not needed if DESeq2::DESeqDataSet given as counts.
- **batch**: character, colname in colData to shape points, normally used by batch effect visualization

**Value**

ggplot showing the expression of the genes on the x axis

**Examples**

data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
dse <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx],
colData(humanGender)[idx[,], design=group)
dse <- DESeq(dse)
degPlotWide(dse, rownames(dse)[1:10], group = "group")

---

**degQC**

*Plot main figures showing p-values distribution and mean-variance correlation*

**Description**

This function joins the output of **degMean**, **degVar** and **degMV** in a single plot. See these functions for further information.

**Usage**

degQC(counts, groups, object = NULL, pvalue = NULL)

**Arguments**

- **counts**: Matrix with counts for each samples and each gene.
- **groups**: Character vector with group name for each sample in the same order than counts column names.
- **object**: DEGSet object.
- **pvalue**: pvalues of DEG analysis.
**degResults**

**Value**

ggplot2 object

**Examples**

```r
data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
dds <- DESeqDataSetFromMatrix(assays(humanGender)[1][1:1000, idx],
colData(humanGender)[idx,], design=~group)
dds <- DESeq(dds)
res <- results(dds)
degQC(counts(dds, normalized=TRUE), colData(dds)["group"],
pvalue = res["pvalue"])
```

**Description**

Complete report from DESeq2 analysis

**Usage**

```r
degResults(
  res = NULL,
  dds, rlogMat = NULL,
  name, org = NULL,
  FDR = 0.05,
  do_go = FALSE,
  FC = 0.1,
  group = "condition",
  xs = "time",
  path_results = ".",
  contrast = NULL
)
```

**Arguments**

- `res` output from `DESeq2::results()` function.
- `dds` `DESeq2::DESeqDataSet()` object.
- `rlogMat` matrix from `DESeq2::rlog()` function.
- `name` string to identify results
- `org` an organism annotation object, like `org.Mm.eg.db`. NULL if you want to skip this step.
**DEGSet**

- **FDR**: int cutoff for false discovery rate.
- **do_go**: boolean if GO enrichment is done.
- **FC**: int cutoff for log2 fold change.
- **group**: string column name in colData(dds) that separates samples in meaningful groups.
- **xs**: string column name in colData(dss) that will be used as X axes in plots (i.e. time).
- **path_results**: character path where files are stored. NULL if you don’t want to save any file.
- **contrast**: list with character vector indicating the fold change values from different comparisons to add to the output table.

**Value**

ggplot2 object

**Examples**

data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
dse <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx],
  colData(humanGender)[idx,], design=group)
dse <- DESeq(dse)
res <- degResults(dds = dse, name = "test", org = NULL,
  do_go = FALSE, group = "group", xs = "group", path_results = NULL)

DEGSet

**Description**

S4 class to store data from differentially expression analysis. It should be compatible with different package and stores the information in a way the methods will work with all of them.

**Usage**

DEGSet(resList, default)

DEGSet(resList, default)

as.DEGSet(object, ...)

## S4 method for signature 'TopTags'

as.DEGSet(object, default = "raw", extras = NULL)

## S4 method for signature 'data.frame'

as.DEGSet(object, contrast, default = "raw", extras = NULL)

## S4 method for signature 'DESeqResults'

as.DEGSet(object, default = "shrunken", extras = NULL)
**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resList</td>
<td>List with results as elements containing log2FoldChange, pvalues and padj as column. Rownames should be feature names. Elements should have names.</td>
</tr>
<tr>
<td>default</td>
<td>The name of the element to use by default.</td>
</tr>
<tr>
<td>object</td>
<td>Different objects to be transformed to DEGSet when using <code>as.DEGSet</code>.</td>
</tr>
<tr>
<td>...</td>
<td>Optional parameters of the generic.</td>
</tr>
<tr>
<td>extras</td>
<td>List of extra tables related to the same comparison when using <code>as.DEGSet</code>.</td>
</tr>
<tr>
<td>contrast</td>
<td>To name the comparison when using <code>as.DEGSet</code>.</td>
</tr>
</tbody>
</table>

**Details**

For now supporting only `DESeq2::results()` output. Use constructor `degComps()` to create the object.

The list will contain one element for each comparison done. Each element has the following structure:

- DEG table
- Optional table with shrunk Fold Change when it has been done.

To access the raw table use `deg(dgs, "raw")`, to access the shrunk table use `deg(dgs, "shrunken")` or just `deg(dgs)`.

**Author(s)**

Lorena Pantano

**Examples**

```r
library(DESeq2)
library(edgeR)
library(limma)
dds <- makeExampleDESeqDataSet(betaSD = 1)
colData(dds)[["treatment"]]<- sample(colData(dds)[["condition"]], 12)
design(dds) <- ~ condition + treatment
dds <- DESeq(dds)
res <- degComps(dds, combs = c("condition"))
deg(res)
deg(res, tidy = "tibble")
# From edgeR
dge <- DGEList(counts=counts(dds), group=colData(dds)[["treatment"]])
dge <- estimateCommonDisp(dge)
res <- as.DEGSet(topTags(exactTest(dge)))
# From limma
v <- voom(counts(dds), model.matrix(~treatment, colData(dds)), plot=FALSE)
fit <- lmFit(v)
fit <- eBayes(fit, robust=TRUE)
res <- as.DEGSet(topTable(fit, n = "Inf"), "A_vs_B")
```
degSignature

Plot gene signature for each group and signature

Description

Given a list of genes belonging to different classes, like markers, plot for each group, the expression values for all the samples.

Usage

degSignature(
  counts,
  signature,
  group = NULL,
  metadata = NULL,
  slot = 1,
  scale = FALSE
)

Arguments

counts  expression data. It accepts bcbioRNASeq, DESeqDataSet and SummarizedExperiment. As well, data.frame or matrix is supported, but it requires metadata in that case.

signature  data.frame with two columns: a) genes that match row.names of counts, b) label to classify the gene inside a group. Normally, cell tissue name.

group  character in metadata used to split data into different groups.

metadata  data frame with sample information. Rownames should match ma column names row number should be the same length than p-values vector.

slot  slotName in the case of SummarizedExperiment objects.

scale  Whether to scale or not the expression.

Value

ggplot plot.

Examples

data(humanGender)
data(geneInfo)
degSignature(humanGender, geneInfo, group = "group")
degSummary

Print Summary Statistics of Alpha Level Cutoffs

Description

Print Summary Statistics of Alpha Level Cutoffs

Usage

degSummary(
  object,
  alpha = c(0.1, 0.05, 0.01),
  contrast = NULL,
  caption = "",
  kable = FALSE
)

Arguments

object Can be DEGSet or DESeqDataSet or DESeqResults.
alpha Numeric vector of desired alpha cutoffs.
contrast Character vector to use with results() function.
caption Character vector to add as caption to the table.
kable Whether return a knitr::kable() output. Default is data.frame.

Value

data.frame or knitr::kable().

Author(s)

Lorena Pantano

References

• original idea of multiple alpha values and code syntax from Michael Steinbaugh.

Examples

library(DESeq2)
data(humanGender)
idx <- c(1:5, 75:80)
counts <- assays(humanGender)[[1]]
dse <- DESeqDataSetFromMatrix(counts[1:1000, idx],
  colData(humanGender)[idx,],
  design = ~group)
dse <- DESeq(dse)
```
res1 <- results(dse)
res2 <- degComps(dse, contrast = c("group_Male_vs_Female"))
degSummary(dse, contrast = "group_Male_vs_Female")
degSummary(res1)
degSummary(res1, kable = TRUE)
degSummary(res2[[1]])
```

---

**degVar**

*Distribution of pvalues by standard deviation range*

### Description

This function plots the p-values distribution colored by the quantiles of the standard deviation of count data.

### Usage

```r
degVar(pvalues, counts)
```

### Arguments

- `pvalues`: pvalues of DEG analysis
- `counts`: Matrix with counts for each sample and each gene. Row number should be the same length than `pvalues` vector.

### Value

`ggplot2` object

### Examples

```r
data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
.dds <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx],
                             colData(humanGender)[idx,], design=~group)
.dds <- DESeq(dds)
res <- results(dds)
degVar(res[, 4], counts(dds))
```
degVB

Distribution of the standard desviation of DE genes compared to the background

Description

Distribution of the standard deviation of DE genes compared to the background

Usage

degVB(tags, group, counts, pop = 400)

Arguments

tags List of genes that are DE.
group Character vector with group name for each sample in the same order than counts column names.
counts matrix with counts for each samples and each gene. Should be same length than pvalues vector.
pop Number of random samples taken for background comparison.

Value

ggplot2 object

Examples

data(humanGender)
library(DESeq2)
idx <- c(1:10, 75:85)
dds <- DESeqDataSetFromMatrix(assays(humanGender)[[1]][1:1000, idx],
colData(humanGender)[idx,], design=~group)
dds <- DESeq(dd)
res <- results(dd)
degVB(row.names(res)[1:20], colData(dd)[["group"]],
counts(dd, normalized = TRUE))

degVolcano

Create volcano plot from log2FC and adjusted pvalues data frame

Description

Create volcano plot from log2FC and adjusted pvalues data frame
Usage

degVolcano(
  stats,
  side = "both",
  title = "Volcano Plot with Marginal Distributions",
  pval.cutoff = 0.05,
  lfc.cutoff = 1,
  shade.colour = "orange",
  shade.alpha = 0.25,
  point.colour = "gray",
  point.alpha = 0.75,
  point.outline.colour = "darkgray",
  line.colour = "gray",
  plot_text = NULL
)

Arguments

  stats        data.frame with two columns: logFC and Adjusted.Pvalue
  side         plot UP, DOWN or BOTH de-regulated points
  title        title for the figure
  pval.cutoff  cutoff for the adjusted pvalue. Default 0.05
  lfc.cutoff   cutoff for the log2FC. Default 1
  shade.colour background color. Default orange.
  shade.alpha  transparency value. Default 0.25
  point.colour colours for points. Default gray
  point.alpha  transparency for points. Default 0.75
  point.outline.colour
                 Default darkgray
  line.colour  Default gray
  plot_text    data.frame with three columns: logFC, Pvalue, Gene name

Details

  This function was mainly developed by @jnhutchinson.

Value

  The function will plot volcano plot together with density of the fold change and p-values on the top
  and the right side of the volcano plot.

Author(s)

  Lorena Pantano, John Hutchinson
Examples

```r
library(DESeq2)
dds <- makeExampleDESeqDataSet(betaSD = 1)
dds <- DESeq(dds)
stats <- results(dds)[,c("log2FoldChange", "padj")]
stats[,"name"] <- row.names(stats)
degVolcano(stats, plot_text = stats[1:10,])
```

geneInfo

data.frame with chromose information for each gene

Description

data.frame with chromose information for each gene

Usage

data(geneInfo)

Format

data.frame

Author(s)

Lorena Pantano, 2014-08-14

Source

biomart

geom_cor

Add correlation and p-value to a ggplot2 plot

Description

geom_cor will add the correlatin, method and p-value to the plot automatically guessing the position if nothing else specified. family font, size and colour can be used to change the format.
Usage

gem.cor(
  mapping = NULL,
  data = NULL,
  method = "spearman",
  xpos = NULL,
  ypos = NULL,
  inherit.aes = TRUE,
  ...
)

Arguments

mapping  Set of aesthetic mappings created by \texttt{aes()} or \texttt{aes()}. If specified and \texttt{inherit.aes} = \texttt{TRUE} (the default), it is combined with the default mapping at the top level of the plot. You must supply \texttt{mapping} if there is no plot mapping.

data      The data to be displayed in this layer. There are three options:
           If NULL, the default, the data is inherited from the plot data as specified in the call to \texttt{ggplot()}.
           A \texttt{data.frame}, or other object, will override the plot data. All objects will be fortified to produce a data frame. See \texttt{fortify()} for which variables will be created.
           A function will be called with a single argument, the plot data. The return value must be a \texttt{data.frame}, and will be used as the layer data.

method    Method to calculate the correlation. Values are passed to \texttt{cor.test}. (Spearman, Pearson, Kendall).

xpos      Locate text at that position on the x axis.

ypos      Locate text at that position on the y axis.

inherit.aes If FALSE, overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn’t inherit behaviour from the default plot specification, e.g. \texttt{borders()}.

... other arguments passed on to \texttt{layer}. These are often aesthetics, used to set an aesthetic to a fixed value, like \texttt{color = "red"} or \texttt{size = 3}. They may also be parameters to the paired geom/stat.

Details

It was integrated after reading this tutorial to extend ggplot2 layers

See Also

\texttt{ggplot2::layer()}
humanGender

**Examples**

```r
data(humanGender)
library(SummarizedExperiment)
library(ggplot2)
ggplot(as.data.frame(assay(humanGender)[1:1000,]),
aes(x = NA20502, y = NA20504)) + 
  geom_point() +
  ylim(0,1.1e5) +
  geom_cor(method = "kendall", ypos = 1e5)
```

---

**significants**  
*Method to get the significant genes*

**Description**

Function to get the features that are significant according to some thresholds from a DEGSet, DESeq2::DESeqResults and edgeR::topTags.
significants

Usage

significants(object, padj = 0.05, fc = 0, direction = NULL, full = FALSE, ...)

## S4 method for signature 'DEGSet'
significants(object, padj = 0.05, fc = 0, direction = NULL, full = FALSE, ...)

## S4 method for signature 'DESeqResults'
significants(object, padj = 0.05, fc = 0, direction = NULL, full = FALSE, ...)

## S4 method for signature 'TopTags'
significants(object, padj = 0.05, fc = 0, direction = NULL, full = FALSE, ...)

## S4 method for signature 'list'
significants(
  object,
  padj = 0.05,
  fc = 0,
  direction = NULL,
  full = FALSE,
  newFDR = FALSE,
  ...
)

Arguments

- **object** \( \text{DEGSet} \)
- **padj** Cutoff for the FDR column.
- **fc** Cutoff for the log2FC column.
- **direction** Whether to take down/up/ignore. Valid arguments are down, up and NULL.
- **full** Whether to return full table or not.
- **...** Passed to \texttt{deg}. Default: value = NULL. Value can be ‘raw’, ‘shrunken’.
- **newFDR** Whether to recalculate the FDR or not. See https://support.bioconductor.org/p/104059/#104072. Only used when a list is giving to the method.

Value

a \texttt{dplyr::tbl_df} data frame. gene column has the feature name. In the case of using this method with the results from \texttt{degComps}, log2FoldChange has the higher foldChange from the comparisons, and padj has the padj associated to the previous column. Then, there is two columns for each comparison, one for the log2FoldChange and another for the padj.

Author(s)

Lorena Pantano
Examples

```r
library(DESeq2)
dds <- makeExampleDESeqDataSet(betaSD=1)
colData(dds)[["treatment"]]<- sample(colData(dds)[["condition"]], 12)
  design(dds) <- ~ condition + treatment
dds <- DESeq(dds)
res <- degComps(dds, contrast = list("treatment_B_vs_A",
  c("condition", "A", "B")))
significants(res, full = TRUE)
# significants(res, full = TRUE, padj = 1) # all genes
```
