Package ‘ExperimentSubset’

March 20, 2024

Type Package

Title Manages subsets of data with Bioconductor Experiment objects

Version 1.12.0

Date 2021-05-09

Description Experiment objects such as the SummarizedExperiment or SingleCellExperiment are data containers for one or more matrix-like assays along with the associated row and column data. Often only a subset of the original data is needed for down-stream analysis. For example, filtering out poor quality samples will require excluding some columns before analysis. The ExperimentSubset object is a container to efficiently manage different subsets of the same data without having to make separate objects for each new subset.

AssaySubset

AssaySubset constructor

Description

Constructor for creating a experiment object internally by the ExperimentSubset object. Should not be used directly by the user.

Usage

AssaySubset(
  subsetName = "subset",
  rowIndices = NULL,
  colIndices = NULL,
  parentAssay = "counts",
  internalAssay = NULL
)

Arguments

  subsetName character(1) Name of the subset.
  rowIndices vector("numeric") Indices of the rows to include in the subset.
  colIndices vector("numeric") Indices of the columns to include in the subset.
  parentAssay character(1) Name of the parent of this subset.
  internalAssay An internal Experiment object to store additional subset data.

Value

A AssaySubset object.

AssaySubset-class

An S4 class to manage subset representation.

Description

An S4 class to manage subset representation.

Slots

  subsetName character(1) Name of the subset.
  rowIndices vector("numeric") Indices of the rows to include in the subset.
  colIndices vector("numeric") Indices of the columns to include in the subset.
  parentAssay character(1) Name of the parent of this subset.
  internalAssay SummarizedExperiment An internal experiment object to store additional subset data.
createSubset

Subset creation method for ExperimentSubset objects

Description
Create a subset from an already available assay in the input ExperimentSubset object by specifying the rows and columns to include in the subset.

Usage
createSubset(x, subsetName, rows = NULL, cols = NULL, parentAssay = NULL)

## S4 method for signature 'SubsetRangedSummarizedExperiment'
createSubset(x, subsetName, rows = NULL, cols = NULL, parentAssay = NULL)

## S4 method for signature 'SubsetSingleCellExperiment'
createSubset(x, subsetName, rows = NULL, cols = NULL, parentAssay = NULL)

## S4 method for signature 'SubsetSummarizedExperiment'
createSubset(x, subsetName, rows = NULL, cols = NULL, parentAssay = NULL)

## S4 method for signature 'SubsetSpatialExperiment'
createSubset(x, subsetName, rows = NULL, cols = NULL, parentAssay = NULL)

## S4 method for signature 'SubsetTreeSummarizedExperiment'
createSubset(x, subsetName, rows = NULL, cols = NULL, parentAssay = NULL)

Arguments
x
ExperimentSubset Specify the object from which a subset should be created. Input can also be any object inherited from SummarizedExperiment for immediate conversion and subset formation. A list of slots can also be passed to directly construct an ES object from matrices similar to SE and SCE constructors.

subsetName character(1) Specify the name of the subset to create.

rows vector("numeric") Specify the rows to include in this subset. If missing or NULL, all rows are included in the subset. Values can be numeric or character. Default NULL.

cols vector("numeric") Specify the columns to include in this subset. If missing or NULL, all columns are included in the subset. Values can be numeric or character. Default NULL.

parentAssay character(1) Specify the parent assay of the subset. This parent assay must already be available in the ExperimentSubset object. If NULL, the first available main assay will be marked as parent. Default NULL.
**Value**

An ExperimentSubset object that now contains the newly created subset.

**Examples**

```r
data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es,
  "subset1",
  rows = c(10,11,56,98,99,102,105,109, 200),
  cols = c(20,21,40,45,90,99,100,123,166,299),
  parentAssay = "counts")
es
```

---

**ExperimentSubset**  
**ExperimentSubset constructor**

**Description**

This constructor function is used to setup the ExperimentSubset object, either through manually specifying the assays, rowData, colData or directly by passing either a SingleCellExperiment or SummarizedExperiment objects or objects inherited by these classes. A subset can also be directly created by passing a named list to the subset parameter. This named list should have parameter values named as subsetName, rows, cols and parentAssay.

**Usage**

```r
ExperimentSubset(
  x,
  subset = list(subsetName = NA, rows = NA, cols = NA, parentAssay = NA)
)
```

**Arguments**

- **x**  
  An experiment object if direct conversion is required or a list of slots to pass onto SingleCellExperiment constructor to generate experiment object from general data.

- **subset**  
  A named list if a subset should be created from within the constructor. Named parameters in this list should be subsetName, rows, cols and parentAssay.

**Value**

A ExperimentSubset object.

**Examples**

```r
data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es es
```
getSubsetAssay

Get subset assay from an ExperimentSubset object.

Description

Get subset assay from an ExperimentSubset object.

Usage

getSubsetAssay(x, subsetName)

## S4 method for signature 'SubsetRangedSummarizedExperiment,character'
getSubsetAssay(x, subsetName)

## S4 method for signature 'SubsetSingleCellExperiment,character'
getSubsetAssay(x, subsetName)

## S4 method for signature 'SubsetSummarizedExperiment,character'
getSubsetAssay(x, subsetName)

## S4 method for signature 'SubsetSpatialExperiment,character'
getSubsetAssay(x, subsetName)

## S4 method for signature 'SubsetTreeSummarizedExperiment,character'
getSubsetAssay(x, subsetName)

Arguments

x Input ExperimentSubset object.

subsetName Specify 'subset name' or 'subset assay name' to fetch the assay from.

Value

Subset assay

Examples

data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, 
  "subset1", 
  rows = c(10,11,50,56,98,99,102,105,109, 200), 
  cols = c(20,21,40,45,90,99,100,123,166,299), 
  parentAssay = "counts")
gegetSubsetAssay(es, "subset1")
**reducedDimNames**

---

**Description**

A wrapper to the `reducedDimNames` from `reducedDims` method with additional support for subsets.

**Usage**

```r
reducedDimNames(x, ...)
```  

## S4 method for signature 'ANY'
```r
reducedDimNames(x, ...)
```  

## S4 method for signature 'ANY'
```r
reducedDimNames(x, ...)
```  

## S4 method for signature 'ANY'
```r
reducedDimNames(x, ...)
```  

**Arguments**

- **x**: Input `ExperimentSubset` object or any object supported by `reducedDimNames` from `reducedDims` method.
- **...**: Additional arguments to pass to into the SCE method.

**Value**

The `reducedDimNames` from the specified subset or same as `reducedDimNames` from `reducedDims` when `subsetName` is missing.

**Examples**

```r
data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, "subset1",
rows = c(1:1500), cols = c(1:1500),
parentAssay = "counts")
reducedDims(es, subsetName = "subset1") <- list(
PCA_1 = scater::calculatePCA(assay(es, "subset1")),
PCA_2 = scater::calculatePCA(assay(es, "subset1")))
reducedDimNames(es, subsetName = "subset1")
```
Description

A wrapper to the `reducedDimNames<-` from `reducedDims` method with additional support for subsets.

Usage

```r
reducedDimNames(x, subsetName) <- value
```

## S4 replacement method for signature 'ANY'
```r
reducedDimNames(x, subsetName) <- value
```

## S4 replacement method for signature 'ANY'
```r
reducedDimNames(x, subsetName) <- value
```

## S4 replacement method for signature 'ANY'
```r
reducedDimNames(x, subsetName) <- value
```

Arguments

- **x**: Input ExperimentSubset object or any object supported by `reducedDimNames<-` from `reducedDims` method.
- **subsetName**: Specify the name of the subset to which the `reducedDimNames<-` should be set to. If missing, `reducedDimNames<-` from `reducedDims` method is called on the main object.
- **value**: Input value same as `reducedDimNames<-` from `reducedDims` method.

Value

Input object with `reducedDimNames<-` set.

Examples

```r
data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, "subset1",
    rows = c(1:1500), cols = c(1:1500),
    parentAssay = "counts")
reducedDims(es, subsetName = "subset1") <- list(
    PCA_1 = scater::calculatePCA(assay(es, "subset1")),
    PCA_2 = scater::calculatePCA(assay(es, "subset1")))
reducedDimNames(es, subsetName = "subset1") <- c("rDim1", "rDim2")
```
Description

A wrapper to the `reducedDims<-` from `reducedDims` method with additional support for subsets.

Usage

```r
reducedDims(x, subsetName) <- value
```

Arguments

- **x**: Input `ExperimentSubset` object or any object supported by `reducedDims<-` from `reducedDims` method.
- **setNaVname**: Specify the name of the subset to which the `reducedDims` should be set to. If `missing`, `reducedDims<-` from `reducedDims` method is called on the main object.
- **value**: A list of values to set to `reducedDims`.

Value

Updated input object with `reducedDims` set.

Examples

```r
data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, "subset1", rows = c(1:1500), cols = c(1:1500), parentAssay = "counts")
reducedDims(es, subsetName = "subset1") <- list(PCA_1 = scater::calculatePCA(assay(es, "subset1")),
PCA_2 = scater::calculatePCA(assay(es, "subset1")))
```

Description

A wrapper to the `reducedDims<-` from `reducedDims` method with additional support for subsets.
Usage

```r
## S4 replacement method for signature 'ANY'
reducedDims(x, subsetName) <- value
```

Arguments

- **x**: Input ExperimentSubset object or any object supported by `reducedDims<-` from `reducedDims` method.
- **subsetName**: Specify the name of the subset to which the `reducedDims` should be set to. If missing, `reducedDims<-` from `reducedDims` method is called on the main object.
- **value**: A list of values to set to `reducedDims`.

Value

Updated input object with `reducedDims` set.

---

**setSubsetAssay**  
*Method for storing new assays inside subsets in ExperimentSubset objects*

**Description**

Store a new subset assay inside a specified subset in the input ExperimentSubset object.

**Usage**

```r
setSubsetAssay(x, subsetName, inputMatrix, subsetAssayName)
```

## S4 method for signature
## 'SubsetRangedSummarizedExperiment,character,ANY,character'
setSubsetAssay(x, subsetName, inputMatrix, subsetAssayName)

## S4 method for signature 'SubsetSingleCellExperiment,character,ANY,character'
setSubsetAssay(x, subsetName, inputMatrix, subsetAssayName)

## S4 method for signature 'SubsetSummarizedExperiment,character,ANY,character'
setSubsetAssay(x, subsetName, inputMatrix, subsetAssayName)

## S4 method for signature 'SubsetSpatialExperiment,character,ANY,character'
setSubsetAssay(x, subsetName, inputMatrix, subsetAssayName)

## S4 method for signature
## 'SubsetTreeSummarizedExperiment,character,ANY,character'
setSubsetAssay(x, subsetName, inputMatrix, subsetAssayName)
subsetAssayCount

Arguments

- **x**: ExperimentSubset Specify the input object.
- **subsetName**: character(1) Specify the name of the existing subset inside which the new subset assay should be stored.
- **inputMatrix**: dgCMatrix The input subset assay.
- **subsetAssayName**: character(1) Specify the name of the new assay against the inputMatrix parameter.

Value

Updated ExperimentSubset object with the new assay stored inside the specified subset.

Examples

```r
data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, "subset1",
    rows = c(10,11,50,56,98,99,102,105,109, 200),
    cols = c(20,21,40,45,90,99,100,123,166,299),
    parentAssay = "counts")
counts1p <- assay(es, "subset1")
counts1p[,] <- counts1p[,] + 1
es <- setSubsetAssay(es, "subset1", counts1p, "scaledSubset1")
es
```

subsetAssayCount

*Count method for subset assays in ExperimentSubset objects*

Description

Get the count of the total available subsets and the subset assays inside these subsets in an ExperimentSubset object.

Usage

```r
subsetAssayCount(x)
```

## S4 method for signature 'SubsetRangedSummarizedExperiment'
subsetAssayCount(x)

## S4 method for signature 'SubsetSingleCellExperiment'
subsetAssayCount(x)

## S4 method for signature 'SubsetSummarizedExperiment'
subsetAssayCount(x)
## S4 method for signature 'SubsetSpatialExperiment'
subsetAssayCount(x)

## S4 method for signature 'SubsetTreeSummarizedExperiment'
subsetAssayCount(x)

### Arguments

- **x**
  - ExperimentSubset Input ExperimentSubset object.

### Value

A numeric value representing the sum of the subset count and subset assay count.

### Examples

```r
data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, "subset1",
                   rows = c(10, 11, 50, 56, 98, 99, 102, 105, 109, 200),
                   cols = c(20, 21, 40, 45, 90, 99, 100, 123, 166, 299),
                   parentAssay = "counts")
assay(es, "subset1",
      subsetAssayName = "subset1pAssay") <- assay(es, "subset1")[,] + 1
subsetAssayCount(es)
```

### Description

Name retrieval method for all subset assays in ExperimentSubset objects

### Usage

- **subsetAssayNames(x)**

  ## S4 method for signature 'SubsetRangedSummarizedExperiment'
  subsetAssayNames(x)

  ## S4 method for signature 'SubsetSingleCellExperiment'
  subsetAssayNames(x)

  ## S4 method for signature 'SubsetSummarizedExperiment'
  subsetAssayNames(x)
## subsetColData

---

### Description

Get colData from a subset. Set colData to a subset.

### Usage

```r
subsetColData(x, subsetName, parentColData)
```

```r
subsetColData(x, subsetName) <- value
```

```r
## S4 method for signature 'SubsetSpatialExperiment'
subsetColData(x)
```

```r
## S4 method for signature 'SubsetTreeSummarizedExperiment'
subsetColData(x)
```

### Arguments

- **x**: ExperimentSubset Input ExperimentSubset object.

### Value

A vector containing the names of the subsets and the subset assays available in the input ExperimentSubset object.

### Examples

```r
data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, "subset1",
rows = c(10,11,50,56,98,99,102,105,109, 200),
cols = c(20,21,40,45,90,99,100,123,166,299),
parentAssay = "counts")
assay(es, "subset1",
subsetAssayName = "subset1pAssay") <- assay(es, "subset1")[, ] + 1
subsetAssayNames(es)
```
## S4 method for signature 'SubsetSingleCellExperiment,character'
subsetColData(x, subsetName, parentColData)

## S4 replacement method for signature 'SubsetSingleCellExperiment,character,DataFrame'
subsetColData(x, subsetName) <- value

## S4 method for signature 'SubsetSummarizedExperiment,character'
subsetColData(x, subsetName, parentColData)

## S4 method for signature 'SubsetSummarizedExperiment,character,DataFrame'
subsetColData(x, subsetName) <- value

## S4 method for signature 'SubsetSpatialExperiment,character'
subsetColData(x, subsetName, parentColData)

## S4 replacement method for signature 'SubsetSpatialExperiment,character,DataFrame'
subsetColData(x, subsetName) <- value

## S4 method for signature 'SubsetTreeSummarizedExperiment,character'
subsetColData(x, subsetName, parentColData)

## S4 replacement method for signature 'SubsetTreeSummarizedExperiment,character,DataFrame'
subsetColData(x, subsetName) <- value

### Arguments

- **x**: ExperimentSubset Input ExperimentSubset object.
- **subsetName**: character(1) Name of the subset to set colData to.
- **parentColData**: logical(1) Logical value indicating if parent colData should be combined or not. Default FALSE.
- **value**: Input DataFrame to store.

### Value

The colData from input object.

Input object with colData stored.

### Examples

```r
data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, "subset1",
cols = c(20L, 21L, 40L, 45L, 90L, 99L, 100L, 123L, 166L, 299L),
      parentAssay = "counts")
subsetColData(es, "subset1")
```
subsetColLinks

Accessor method for colLinks from subsets in ExperimentSubset objects

Description
Get colLinks from a subset.

Usage
subsetColLinks(x, subsetName, parentColLinkData)

## S4 method for signature 'SubsetTreeSummarizedExperiment,character'
subsetColLinks(x, subsetName, parentColLinkData)

Arguments
x ExperimentSubset Input ExperimentSubset object.
subsetName character(1) Name of the subset to get colLinks from.
parentColLinkData logical(1) Logical value indicating if parent colLinks should be combined or not. Default FALSE.

Value
The colLinks from input object.

subsetColnames

Description
Get colnames from a subset in the ExperimentSubset object.
Set colnames to a subset in the ExperimentSubset object.

Usage
subsetColnames(x, subsetName)

subsetColnames(x, subsetName) <- value

## S4 method for signature 'SubsetRangedSummarizedExperiment,character'
subsetColnames(x, subsetName)

## S4 replacement method for signature 'SubsetRangedSummarizedExperiment,character'
subsetColnames(x,_subsetName) <- value

## S4 method for signature 'SubsetSingleCellExperiment,character'
subsetColnames(x, subsetName)

## S4 replacement method for signature 'SubsetSingleCellExperiment,character'
subsetColnames(x, subsetName) <- value

## S4 method for signature 'SubsetSummarizedExperiment,character'
subsetColnames(x, subsetName)

## S4 replacement method for signature 'SubsetSummarizedExperiment,character'
subsetColnames(x, subsetName) <- value

## S4 method for signature 'SubsetSpatialExperiment,character'
subsetColnames(x, subsetName)

## S4 replacement method for signature 'SubsetSpatialExperiment,character'
subsetColnames(x, subsetName) <- value

## S4 method for signature 'SubsetTreeSummarizedExperiment,character'
subsetColnames(x, subsetName)

## S4 replacement method for signature 'SubsetTreeSummarizedExperiment,character'
subsetColnames(x, subsetName) <- value

### Arguments

- **x**
  - Input ExperimentSubset object.

- **subsetName**
  - Name of the subset to set colnames to.

- **value**
  - Specify the colname values to replace.

### Value

A vector of colnames.

Input object with colnames set to a subset.

### Examples

data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es,
  "subset1",
  rows = c(10,11,50,56,99,99,102,105,109, 200),
cols = c(20,21,40,45,90,99,100,123,166,299),
parentAssay = "counts")
subsetColnames(es, "subset1")
Description

Get the total count of the available subsets (excluding subset assays) in an ExperimentSubset object.

Usage

\[
\text{subsetCount}(x)
\]

## S4 method for signature 'SubsetRangedSummarizedExperiment'
subsetCount(x)

## S4 method for signature 'SubsetSingleCellExperiment'
subsetCount(x)

## S4 method for signature 'SubsetSummarizedExperiment'
subsetCount(x)

## S4 method for signature 'SubsetSpatialExperiment'
subsetCount(x)

## S4 method for signature 'SubsetTreeSummarizedExperiment'
subsetCount(x)

Arguments

x               ExperimentSubset Input ExperimentSubset object.

Value

A numeric value representing the total count of the subsets.

Examples

data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es,
  "subset1",
  rows = c(10, 11, 50, 56, 98, 99, 102, 105, 109, 200),
cols = c(20, 21, 40, 45, 90, 99, 100, 123, 166, 299),
parentAssay = "counts")
subsetCount(es)
subsetDim  

Get dimensions of subsets in ExperimentSubset objects

Description

Retrieves the dimensions of the specified subset in an ExperimentSubset object.

Usage

subsetDim(x, subsetName)

## S4 method for signature 'SubsetRangedSummarizedExperiment,character'
subsetDim(x, subsetName)

## S4 method for signature 'SubsetSingleCellExperiment,character'
subsetDim(x, subsetName)

## S4 method for signature 'SubsetSummarizedExperiment,character'
subsetDim(x, subsetName)

## S4 method for signature 'SubsetSpatialExperiment,character'
subsetDim(x, subsetName)

## S4 method for signature 'SubsetTreeSummarizedExperiment,character'
subsetDim(x, subsetName)

Arguments

x  ExperimentSubset Input ExperimentSubset object.
subsetName  character(1) Name of the subset to retrieve the dimensions from.

Value

A vector containing the dimensions of the specified subset i.e. the number of rows and the number of columns in the subset.

Examples

data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es,  
"subset1",  
rows = c(10,11,50,56,98,99,102,105,109, 200),  
cols = c(20,21,40,45,90,99,100,123,166,299),  
parentAssay = "counts")
subsetDim(es, "subset1")
subsetNames

Get names of only the subsets in ExperimentSubset objects

Description

Retrieves the names of the available subsets (not the subset assays) in an ExperimentSubset object.

Usage

subsetNames(x)

## S4 method for signature 'SubsetRangedSummarizedExperiment'
subsetNames(x)

## S4 method for signature 'SubsetSingleCellExperiment'
subsetNames(x)

## S4 method for signature 'SubsetSummarizedExperiment'
subsetNames(x)

## S4 method for signature 'SubsetSpatialExperiment'
subsetNames(x)

## S4 method for signature 'SubsetTreeSummarizedExperiment'
subsetNames(x)

Arguments

x ExperimentSubset Specify the input ES object.

Value

A vector of subset names.

Examples

data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es,
"subset1",
rows = c(10,11,50,56,98,99,102,105,109, 200),
cols = c(20,21,40,45,90,99,100,123,166,299),
pParentAssay = "counts")
subsetNames(es)
subsetParent

Subset parent hierarchy retrieval method for ExperimentSubset objects

Description

Retrieves a complete 'subset to parent' link from a specified subset.

Usage

subsetParent(x, subsetName)

## S4 method for signature 'SubsetRangedSummarizedExperiment'
subsetParent(x, subsetName)

## S4 method for signature 'SubsetSingleCellExperiment'
subsetParent(x, subsetName)

## S4 method for signature 'SubsetSummarizedExperiment'
subsetParent(x, subsetName)

## S4 method for signature 'SubsetSpatialExperiment'
subsetParent(x, subsetName)

## S4 method for signature 'SubsetTreeSummarizedExperiment'
subsetParent(x, subsetName)

Arguments

x

Input ExperimentSubset object.

subsetName

character(1) Specify the name of the subset against which the 'subset to parent' link should be retrieved.

Value

A list containing the 'subset to parent' link.

Examples

data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, "subset1",
rows = c(10,11,50,56,99,102,105,109, 200),
cols = c(20,21,40,45,90,99,100,123,166,299),
parentAssay = "counts")
assay(es, "subset1",
subsetAssayName = "subset1pAssay") <- assay(es, "subset1")[,] + 1
subsetParent(es, "subset1pAssay")
Description

An S4 class for RangedSummarizedExperiment objects with added support for subsets.

Slots

subsets A list of AssaySubset objects.

subsetRowData Accessor method for rowData from subsets in ExperimentSubset objects

Description

Get rowData from a subset.
Set rowData to a subset.

Usage

subsetRowData(x, subsetName, parentRowData)

subsetRowData(x, subsetName) <- value

## S4 method for signature 'SubsetRangedSummarizedExperiment,character'
subsetRowData(x, subsetName, parentRowData)

## S4 replacement method for signature
## 'SubsetRangedSummarizedExperiment,character,DataFrame'
subsetRowData(x, subsetName) <- value

## S4 method for signature 'SubsetSingleCellExperiment,character'
subsetRowData(x, subsetName, parentRowData)

## S4 replacement method for signature 'SubsetSingleCellExperiment,character,DataFrame'
subsetRowData(x, subsetName) <- value

## S4 replacement method for signature 'SubsetSummarizedExperiment,character'
subsetRowData(x, subsetName) <- value

## S4 method for signature 'SubsetSummarizedExperiment,character'
subsetRowData(x, subsetName, parentRowData)

## S4 method for signature 'SubsetSpatialExperiment,character'
subsetRowData(x, subsetName, parentRowData)

## S4 replacement method for signature 'SubsetSpatialExperiment,character,DataFrame'
subsetRowData(x, subsetName, parentRowData) <- value

## S4 method for signature 'SubsetTreeSummarizedExperiment,character'
subsetRowData(x, subsetName, parentRowData)

## S4 replacement method for signature 'SubsetTreeSummarizedExperiment,character,DataFrame'
subsetRowData(x, subsetName) <- value

**Arguments**

- `x` ExperimentSubset Input ExperimentSubset object.
- `subsetName` character(1) Name of the subset to set rowData to.
- `parentRowData` logical(1) Logical value indicating if parent rowData should be combined or not. Default FALSE.
- `value` Input DataFrame to store.

**Value**

The rowData from input object.

Input object with rowData stored.

**Examples**

data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, "subset1", rows = c(10,11,50,56,98,99,102,105,109, 200), cols = c(20,21,40,45,90,99,100,123,166,299), parentAssay = "counts")
subsetRowData(es, "subset1")

**Description**

Get rowLinks from a subset.
subsetRownames

Usage

subsetRowLinks(x, subsetName, parentRowLinkData)

## S4 method for signature 'SubsetTreeSummarizedExperiment,character'
subsetRowLinks(x, subsetName, parentRowLinkData)

Arguments

- **x**: ExperimentSubset Input ExperimentSubset object.
- **subsetName**: character(1) Name of the subset to get rowLinks from.
- **parentRowLinkData**: logical(1) Logical value indicating if parent rowLinks should be combined or not. Default FALSE.

Value

The rowLinks from input object.

---

subsetRownames subsetRownames

Description

Get rownames from a subset in the ExperimentSubset object.
Set colnames to a subset in the ExperimentSubset object.

Usage

subsetRownames(x, subsetName)

subsetRownames(x, subsetName) <- value

## S4 method for signature 'SubsetRangedSummarizedExperiment,character'
subsetRownames(x, subsetName)

## S4 replacement method for signature 'SubsetRangedSummarizedExperiment,character'
subsetRownames(x, subsetName) <- value

## S4 method for signature 'SubsetSingleCellExperiment,character'
subsetRownames(x, subsetName)

## S4 replacement method for signature 'SubsetSingleCellExperiment,character'
subsetRownames(x, subsetName) <- value

## S4 method for signature 'SubsetSummarizedExperiment,character'
subsetRownames(x, subsetName)
## S4 replacement method for signature 'SubsetSummarizedExperiment,character'
subsetRownames(x, subsetName) <- value

## S4 method for signature 'SubsetSpatialExperiment,character'
subsetRownames(x, subsetName)

## S4 replacement method for signature 'SubsetSpatialExperiment,character'
subsetRownames(x, subsetName) <- value

## S4 method for signature 'SubsetTreeSummarizedExperiment,character'
subsetRownames(x, subsetName)

## S4 replacement method for signature 'SubsetTreeSummarizedExperiment,character'
subsetRownames(x, subsetName) <- value

### Arguments

- **x**: Input ExperimentSubset object.
- **subsetName**: Name of the subset to set colnames to.
- **value**: Specify the rownames values to replace.

### Value

A vector of colnames.

Input object with rownames set to a subset.

### Examples

```r
data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubset(es, "subset1",
  rows = c(10,11,50,56,98,99,102,105,109, 200),
  cols = c(20,21,40,45,90,99,100,123,166,299),
  parentAssay = "counts")
subsetRownames(es, "subset1")
```

### Description

An S4 class for SingleCellExperiment objects with added support for subsets.
## subsetSpatialCoords

### Slots

- subsets: A list of AssaySubset objects.

### subsetSpatialCoords

*Accessor method for spatialCoords from subsets in ExperimentSubset objects*

### Description

Get spatialCoords from a subset.

### Usage

```r
subsetSpatialCoords(x, subsetName)
```

```r
## S4 method for signature 'SubsetSpatialExperiment,character'
subsetSpatialCoords(x, subsetName)
```

### Arguments

- `x`: ExperimentSubset object.
- `subsetName`: character(1) Name of the subset to get spatialCoords from.

### Value

The spatialCoords from input object.

## subsetSpatialData

*Accessor method for spatialData from subsets in ExperimentSubset objects*

### Description

Get spatialData from a subset.
Set spatialData to a subset.

### Usage

```r
subsetSpatialData(x, subsetName, parentSpatialData)
```

```r
subsetSpatialData(x, subsetName) <- value
```

```r
## S4 method for signature 'SubsetSpatialExperiment,character'
subsetSpatialData(x, subsetName, parentSpatialData)
```

```r
## S4 replacement method for signature 'SubsetSpatialExperiment,character,data.frame'
subsetSpatialData(x, subsetName) <- value
```
**Arguments**

- `x` ExperimentSubset Input ExperimentSubset object.
- `subsetName` character(1) Name of the subset to set spatialData to.
- `parentSpatialData` logical(1) Logical value indicating if parent spatialData should be combined or not. Default FALSE.
- `value` Input data.frame to store.

**Value**

The spatialData from input object.

Input object with spatialData stored.

---

**Description**

An S4 class for SpatialExperiment objects with added support for subsets.

**Slots**

- `subsets` A list of AssaySubset objects.

---

**Description**

An S4 class for SummarizedExperiment objects with added support for subsets.

**Slots**

- `subsets` A list of AssaySubset objects.
subsetSummary

Method for displaying 'child-parent' link structure of subsets in ExperimentSubset objects

Description

The function displays the content of an ExperimentSubset object including all available main assays, all subsets and the subset assays inside these subsets. This function also depicts how and in what order the subsets in the object are linked with their parents. Moreover, all supplementary data inside the subsets such as reducedDims and altExps are also displayed against each subset entry.

Usage

subsetSummary(x)

## S4 method for signature 'SubsetRangedSummarizedExperiment'
subsetSummary(x)

## S4 method for signature 'SubsetSingleCellExperiment'
subsetSummary(x)

## S4 method for signature 'SubsetSummarizedExperiment'
subsetSummary(x)

## S4 method for signature 'SubsetSpatialExperiment'
subsetSummary(x)

## S4 method for signature 'SubsetTreeSummarizedExperiment'
subsetSummary(x)

Arguments

x ExperimentSubset Input ExperimentSubset object.

Value

Prints all the available subset information against the input ExperimentSubset object.

Examples

data(sce_chcl, package = "scds")
es <- ExperimentSubset(sce_chcl)
es <- createSubSet(es, 
"subset1",
rows = c(10,11,50,56,98,99,102,105,109, 200),
cols = c(20,21,40,45,90,99,100,123,166,299),
parentAssay = "counts")
assay(es, "subset1",

subsetAssayName = "subset1pAssay") <- assay(es, "subset1")[,] + 1
subsetSummary(es)

SubsetTreeSummarizedExperiment-class

An S4 class for TreeSummarizedExperiment objects with added support for subsets.

Description

An S4 class for TreeSummarizedExperiment objects with added support for subsets.

Slots

subsets A list of AssaySubset objects.
