Package ‘MatrixGenerics’

May 29, 2024

Title S4 Generic Summary Statistic Functions that Operate on Matrix-Like Objects

Description S4 generic functions modeled after the 'matrixStats' API for alternative matrix implementations. Packages with alternative matrix implementation can depend on this package and implement the generic functions that are defined here for a useful set of row and column summary statistics. Other package developers can import this package and handle a different matrix implementations without worrying about incompatibilities.

             ..., useNames = TRUE)
```

Arguments

- **x**: An NxK matrix-like object.
- **...**: Additional arguments passed to specific methods.
- **rows, cols**: A vector indicating the subset of rows (and/or columns) to operate over. If `NULL`, no subsetting is done.
If TRUE, missing values (NA or NaN) are omitted from the calculations.

An integer vector of length two specifying the dimension of x, essential when x is a numeric vector. Note, that this is not a generic argument and not all methods need provide it.

If TRUE (default), names attributes of result are set. Else if FALSE, no naming support is done.

The S4 methods for x of type matrix, array, table, or numeric call matrixStats::rowRanges / matrixStats::colRanges.

Value

a numeric Nx2 (Kx2) matrix, where N (K) is the number of rows (columns) for which the ranges are calculated.

Note

Unfortunately for the argument list of the rowRanges() generic function we cannot follow the scheme used for the other row/column matrix summarization generic functions. This is because we need to be compatible with the historic rowRanges() getter for RangedSummarizedExperiment objects. See ?SummarizedExperiment::rowRanges.

See Also

• matrixStats::rowRanges() and matrixStats::colRanges() which are used when the input is a matrix or numeric vector.
• For max estimates, see rowMaxs().
• For min estimates, see rowMins().
• base::range().

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0

print(mat)
rowRanges(mat)
colRanges(mat)
```
rowRanks

colRanks(x, rows = NULL, cols = NULL, ties.method = c("max", "average"),
          ..., useNames = TRUE)

## S4 method for signature 'matrix_OR_array_OR_table_OR_numeric'
colRanks(x, rows = NULL,
          cols = NULL, ties.method = c("max", "average", "first", "last", "random",
                                      "max", "min", "dense"), dim. = dim(x), preserveShape = FALSE, ..., useNames = TRUE)

colRanks(x, rows = NULL, cols = NULL, ties.method = c("max", "average"), ..., useNames = TRUE)

Arguments

x

An NxK matrix-like object.

rows, cols

A vector indicating the subset of rows (and/or columns) to operate over. If NULL, no subsetting is done.

ties.method

A character string specifying how ties are treated. Note that the default specifies fewer options than the original matrixStats package.

...  

Additional arguments passed to specific methods.

useNames

If TRUE (default), names attributes of result are set. Else if FALSE, no naming support is done.
An integer vector of length two specifying the dimension of \( x \), essential when \( x \) is a numeric vector. Note, that this is not a generic argument and not all methods need provide it.

If TRUE the output matrix has the same shape as the input \( x \). Note, that this is not a generic argument and not all implementation of this function have to provide it.

The S4 methods for \( x \) of type matrix, array, table, or numeric call `matrixStats::rowRanks` / `matrixStats::colRanks`.

The `matrixStats::rowRanks()` function can handle a lot of different values for the ties.method argument. Users of the generic function should however only rely on max and average because the other ones are not guaranteed to be implemented:

- max for values with identical values the maximum rank is returned
- average for values with identical values the average of the ranks they cover is returned. Note, that in this case the return value is of type numeric.

a matrix of type integer is returned unless ties.method = "average". It has dimensions' \( N \times J \) matrix, where \( N \) (\( K \)) is the number of rows (columns) of the input \( x \).

- `base::rank`

Examples

```r
mat <- matrix(rnorm(15), nrow = 5, ncol = 3)
mat[2, 1] <- NA
mat[3, 3] <- Inf
mat[4, 1] <- 0
print(mat)
rowRanks(mat)
colRanks(mat)
```

           trim = 0, ..., useNames = TRUE)
```

```r
