# Package ‘PureCN’

January 20, 2024

**Type**  Package  

**Title**  Copy number calling and SNV classification using targeted short read sequencing  

**Version**  2.8.1  

**Date**  2023-10-20  

**Description**  This package estimates tumor purity, copy number, and loss of heterozygosity (LOH), and classifies single nucleotide variants (SNVs) by somatic status and clonality. PureCN is designed for targeted short read sequencing data, integrates well with standard somatic variant detection and copy number pipelines, and has support for tumor samples without matching normal samples.

**Depends**  R (>= 3.5.0), DNAcopy, VariantAnnotation (> = 1.14.1)  

**Imports**  GenomicRanges (>= 1.20.3), IRanges (>= 2.2.1), RColorBrewer, S4Vectors, data.table, grDevices, graphics, stats, utils, SummarizedExperiment, GenomeInfoDb, GenomicFeatures, Rsamtools, Biobase, Biostrings, BiocGenerics, rtracklayer, ggplot2, gridExtra, futile.logger, VGAM, tools, methods, mclust, rhdf5, Matrix  

**Suggests**  BiocParallel, BiocStyle, PSCBS, R.utils, TxDb.Hsapiens.UCSC.hg19.knownGene, covr, knitr, optparse, org.Hs.eg.db, jsonlite, markdown, rmarkdown, testthat  

**Enhances**  genomicsdb (> = 0.0.3)  

**VignetteBuilder**  knitr  

**License**  Artistic-2.0  

**URL**  [https://github.com/lima1/PureCN](https://github.com/lima1/PureCN)  

**biocViews**  CopyNumberVariation, Software, Sequencing, VariantAnnotation, VariantDetection, Coverage, ImmunoOncology  

**NeedsCompilation**  no  

**ByteCompile**  yes  

**RoxygenNote**  7.2.3

**annotateTargets**

Annotate targets with gene symbols

**Description**

This function can be used to add a ‘Gene’ meta column containing gene symbols to a \texttt{GRanges} object. It applies heuristics to find the protein coding genes that were likely meant to target in the assay design in case transcripts overlap.

**Usage**

\begin{verbatim}
annotateTargets(x, txdb, org)
\end{verbatim}

**Arguments**

\begin{itemize}
  \item \texttt{x} \hspace{1cm} A \texttt{GRanges} object with interals to annotate
  \item \texttt{txdb} \hspace{1cm} A \texttt{TxDb} database, e.g. \texttt{TxDb.Hsapiens.UCSC.hg19.knownGene}
  \item \texttt{org} \hspace{1cm} A \texttt{OrgDb} object, e.g. \texttt{org.Hs.eg.db}
\end{itemize}

**Value**

A \texttt{GRanges} object.

**Author(s)**

Markus Riester
**bootstrapResults**

*Bootstrapping variant fits*

**Description**

This function bootstraps variants, then optionally re-ranks solutions by using the bootstrap estimate of the likelihood score, and then optionally removes solutions that never ranked high in any bootstrap replicate.

**Usage**

`bootstrapResults(res, n = 500, top = NULL, reorder = FALSE)`

**Arguments**

- `res`          Return object of the `runAbsoluteCN` function.
- `n`            Number of bootstrap replicates.
- `top`          Include solution if it appears in the top `n` solutions of any bootstrap replicate. If `NULL`, do not filter solutions.
- `reorder`      Reorder results by bootstrap value.

**Value**

Returns a `runAbsoluteCN` object with added bootstrap value to each solution. This value is the fraction of bootstrap replicates in which the solution ranked first.

**Author(s)**

Markus Riester

`runAbsoluteCN`
calculateBamCoverageByInterval

Function to calculate coverage from BAM file

Description
Takes a BAM file and an interval file as input and returns coverage for each interval. Coverage should be then GC-normalized using the correctCoverageBias function before determining purity and ploidy with runAbsoluteCN. Uses the scanBam function and applies low quality, duplicate reads as well as secondary alignment filters.

Usage
calculateBamCoverageByInterval(
  bam.file, 
  interval.file, 
  output.file = NULL, 
  index.file = bam.file, 
  keep.duplicates = FALSE, 
  chunks = 20, 
  ... 
)

Arguments
- interval.file: File specifying the intervals. Interval is expected in first column in format CHR:START-END.
- output.file: Optionally, write minimal coverage file. Can be read with the readCoverageFile function.
- index.file: The bai index. This is expected without the .bai file suffix, see ?scanBam.
- keep.duplicates: Keep or remove duplicated reads.
- chunks: Split interval.file into specified number of chunks to reduce memory usage.
- ...: Additional parameters passed to ScanBamParam.

Value
Returns total and average coverage by intervals.

Examples

```r
data(purecn.example.output)
ret.boot <- bootstrapResults(purecn.example.output, n=100)
plotAbs(ret.boot, type="overview")
```
calculateLogRatio

Calculate coverage log-ratio of tumor vs. normal

Description

This function is automatically called by runAbsoluteCN when normal and tumor coverage are provided (and not a segmentation file or target-level log-ratios). This function is therefore normally not called by the user.

Usage

calculateLogRatio(normal, tumor)

Arguments

normal Normal coverage read in by the readCoverageFile function.
tumor Tumor coverage read in by the readCoverageFile function.

Value

numeric(length(tumor)), tumor vs. normal copy number log-ratios for all targets.

Author(s)

Markus Riester
Examples

```r
normal.coverage.file <- system.file("extdata", "example_normal.txt.gz",  
  package = "PureCN")
```

```r
tumor.coverage.file <- system.file("extdata", "example_tumor.txt.gz",  
  package = "PureCN")
```

```r
normal <- readCoverageFile(normal.coverage.file)
tumor <- readCoverageFile(tumor.coverage.file)
log.ratio <- calculateLogRatio(normal, tumor)
```

---

**calculateMappingBiasGatk4**

*Calculate Mapping Bias from GATK4 GenomicsDB*

**Description**

Function calculate mapping bias for each variant in the provided panel of normals GenomicsDB.

**Usage**

```r
calculateMappingBiasGatk4(
  workspace,
  reference.genome,
  min.normals = 1,
  min.normals.betafit = 7,
  min.normals.assign.betafit = 3,
  min.normals.position.specific.fit = 10,
  min.median.coverage.betafit = 5,
  num.betafit.clusters = 9,
  min.betafit.rho = 1e-04,
  max.betafit.rho = 0.2,
  AF.info.field = "AF"
)
```

**Arguments**

- `workspace`: Path to the GenomicsDB created by `GenomicsDBImport`
- `min.normals`: Minimum number of normals with heterozygous SNP for calculating position-specific mapping bias.
- `min.normals.betafit`: Minimum number of normals with heterozygous SNP fitting a beta distribution
- `min.normals.assign.betafit`: Minimum number of normals with heterozygous SNPs to assign to a beta binomial fit cluster
calculateMappingBiasVcf

Minimum normals to use position-specific beta-binomial fits. Otherwise only clustered fits are used.

Minimum median coverage of normals with heterozygous SNP for fitting a beta distribution

Maximum number of beta binomial fit clusters

Minimum dispersion factor rho

Maximum dispersion factor rho

Field in the workspace that stores the allelic fraction

A GRanges object with mapping bias and number of normal samples with this variant.

Markus Riester

## Examples

```r
## Not run:
resources_file <- system.file("extdata", "gatk4_pon_db.tgz", 
package = "PureCN")
tmp_dir <- tempdir()
untar(resources_file, exdir = tmp_dir)
workspace <- file.path(tmp_dir, "gatk4_pon_db")
bias <- calculateMappingBiasGatk4(workspace, "hg19")
saveRDS(bias, "mapping_bias.rds")
unlink(tmp_dir, recursive=TRUE)
```

## End(Not run)

calculateMappingBiasVcf

*Calculate Mapping Bias*

Function calculate mapping bias for each variant in the provided panel of normals VCF.
Usage

calculateMappingBiasVcf(
  normal.panel.vcf.file,
  min.normals = 1,
  min.normals.betafit = 7,
  min.normals.assign.betafit = 3,
  min.normals.position.specific.fit = 10,
  min.median.coverage.betafit = 5,
  num.betafit.clusters = 9,
  min.betafit.rho = 1e-04,
  max.betafit.rho = 0.2,
  yieldSize = 50000,
  genome
)

Arguments

  normal.panel.vcf.file
    character(1) Combined VCF file of a panel of normals, reference and alt
counts as AD genotype field. Needs to be compressed and indexed with bgzip
and tabix, respectively.

  min.normals
    Minimum number of normals with heterozygous SNP for calculating position-specific mapping bias.

  min.normals.betafit
    Minimum number of normals with heterozygous SNP fitting a beta binomial distribution

  min.normals.assign.betafit
    Minimum number of normals with heterozygous SNPs to assign to a beta binomial fit cluster

  min.normals.position.specific.fit
    Minimum normals to use position-specific beta-binomial fits. Otherwise only clustered fits are used.

  min.median.coverage.betafit
    Minimum median coverage of normals with heterozygous SNP for fitting a beta binomial distribution

  num.betafit.clusters
    Maximum number of beta binomial fit clusters

  min.betafit.rho
    Minimum dispersion factor rho

  max.betafit.rho
    Maximum dispersion factor rho

  yieldSize
    See TabixFile

  genome
    See readVcf

Value

A GRanges object with mapping bias and number of normal samples with this variant.
calculatePowerDetectSomatic

*Power calculation for detecting somatic mutations*

**Description**
This function calculates the probability of correctly rejecting the null hypothesis that an alt allele is a sequencing error rather than a true (mono-)clonal mutation.

**Usage**
```r
calculatePowerDetectSomatic(
  coverage,
  f = NULL,
  purity = NULL,
  ploidy = NULL,
  cell.fraction = 1,
  error = 0.001,
  fpr = 5e-07,
  verbose = TRUE
)
```

**Arguments**
- **coverage**: Mean sequencing coverage.
- **f**: Mean expected allelic fraction. If **NULL**, requires purity and ploidy and then calculates the expected fraction.
- **purity**: Purity of sample. Only required when **f** is **NULL**.
- **ploidy**: Ploidy of sample. Only required when **f** is **NULL**.
- **cell.fraction**: Fraction of cells harboring mutation. Ignored if **f** is not **NULL**.
- **error**: Estimated sequencing error rate.
- **fpr**: Required false positive rate for mutation vs. sequencing error.
- **verbose**: Verbose output.

**Examples**
```r
normal.panel.vcf <- system.file("extdata", "normalpanel.vcf.gz", 
                               package = "PureCN")
bias <- calculateMappingBiasVcf(normal.panel.vcf, genome = "h19")
saveRDS(bias, "mapping_bias.rds")
```
calculatePowerDetectSomatic

Value

A list with elements

- **power**: Power to detect somatic mutations.
- **k**: Minimum number of supporting reads.
- **f**: Expected allelic fraction.

Author(s)

Markus Riester

References

Examples

```r
purity <- c(0.1, 0.15, 0.2, 0.25, 0.4, 0.6, 1)
coverage <- seq(5, 35, 1)
power <- lapply(purity, function(p) sapply(coverage, function(cv)
  calculatePowerDetectSomatic(coverage = cv, purity = p, ploidy = 2,
  verbose = FALSE)$power))

# Figure S7b in Carter et al.
plot(coverage, power[[1]], col = 1, xlab = "Sequence coverage",
ylab = "Detection power", ylim = c(0, 1), type = "l")
for (i in 2:length(power)) lines(coverage, power[[i]], col = i)
abline(h = 0.8, lty = 2, col = "grey")
legend("bottomright", legend = paste("Purity", purity),
fill = seq_along(purity))

# Figure S7c in Carter et al.
coverage <- seq(5, 350, 1)
power <- lapply(purity, function(p) sapply(coverage, function(cv)
  calculatePowerDetectSomatic(coverage = cv, purity = p, ploidy = 2,
  cell.fraction = 0.2, verbose = FALSE)$power))
plot(coverage, power[[1]], col = 1, xlab = "Sequence coverage",
ylab = "Detection power", ylim = c(0, 1), type = "l")
for (i in 2:length(power)) lines(coverage, power[[i]], col = i)
abline(h = 0.8, lty = 2, col = "grey")
legend("bottomright", legend = paste("Purity", purity),
fill = seq_along(purity))
```
calculateTangentNormal

*Calculate tangent normal*

**Description**

Reimplementation of GATK4 denoising. Please cite the relevant GATK publication if you use this in a publication.

**Usage**

```r
calculateTangentNormal(
  tumor.coverage.file, 
  normalDB, 
  num.eigen = 20, 
  ignore.sex = FALSE, 
  sex = NULL 
)
```

**Arguments**

- `tumor.coverage.file` Coverage file or data of a tumor sample.
- `normalDB` Database of normal samples, created with `createNormalDatabase`.
- `num.eigen` Number of eigen vectors used.
- `ignore.sex` If FALSE, detects sex of sample and returns best normals with matching sex.
- `sex` Sex of sample. If NULL, determine with `getSexFromCoverage` and default parameters. Valid values are `F` for female, `M` for male. If all chromosomes are diploid, specify diploid.

**Author(s)**

Markus Riester

**See Also**

- `createNormalDatabase`

**Examples**

```r
tumor.coverage.file <- system.file('extdata', 'example_tumor.txt.gz',
  package = 'PureCN')
normal.coverage.file <- system.file("extdata", "example_normal.txt.gz",
  package = "PureCN")
normal2.coverage.file <- system.file("extdata", "example_normal2.txt.gz",
  package = "PureCN")
normal.coverage.files <- c(normal.coverage.file, normal2.coverage.file)
```
normalDB <- createNormalDatabase(normal.coverage.files)
pool <- calculateTangentNormal(tumor.coverage.file, normalDB)

callAlterations  Calling of amplifications and deletions

Description
Function to extract major copy number alterations from a runAbsoluteCN return object.

Usage
callAlterations(
res,
id = 1,
cutoffs = c(0.5, 6, 7),
log.ratio.cutoffs = c(-0.9, 0.9),
failed = NULL,
all.genes = FALSE
)

Arguments

res  Return object of the runAbsoluteCN function.
id  Candidate solutions to be used. id=1 will use the maximum likelihood (or curated) solution.
cutoffs  Copy numbers cutoffs to call losses, focal amplifications and broad amplifications.
log.ratio.cutoffs  Copy numbers log-ratio cutoffs to call losses and amplifications in failed samples.
failed  Indicates whether sample was failed. If NULL, use available annotation, which can be set in the curation file.
all.genes  If FALSE, then only return amplifications and deletions passing the thresholds.

Value
A data.frame with gene-level amplification and deletion calls.

Author(s)
Markus Riester

See Also
runAbsoluteCN
callAlterationsFromSegmentation

Calling of amplifications and deletions from segmentations

Description

This function can be used to obtain gene-level copy number calls from segmentations. This is useful for comparing PureCN’s segmentations with segmentations obtained by different tools on the gene-level. Segmentation file can contain multiple samples.

Usage

```r
callAlterationsFromSegmentation(
  sampleid,
  chr,
  start,
  end,
  num.mark = NA,
  seg.mean,
  C,
  interval.file,
  fun.focal = findFocal,
  args.focal = list(),
  ...
)
```

Arguments

- **sampleid**: The sampleid column in the segmentation file.
- **chr**: The chromosome column.
- **start**: The start positions of the segments.
- **end**: The end positions of the segments.
- **num.mark**: Optionally, the number of probes or markers in each segment.
- **seg.mean**: The segment mean.
- **C**: The segment integer copy number.
- **interval.file**: A mapping file that assigns GC content and gene symbols to each exon in the coverage files. Used for generating gene-level calls. First column in format CHR:START-END. Second column GC content (0 to 1). Third column gene symbol. This file is generated with the `preprocessIntervals` function.
fun.focal  Function for identifying focal amplifications. Defaults to \texttt{findFocal}.

args.focal  Arguments for focal amplification function.

...  Arguments passed to \texttt{callAlterations}.

\textbf{Value}

A list of \texttt{callAlterations} data.frame objects, one for each sample.

\textbf{Author(s)}

Markus Riester

\textbf{Examples}

data(purecn.example.output)
seg <- purecn.example.output$results[[1]]$seg
interval.file <- system.file("extdata", "example_intervals.txt",
package = "PureCN")
calls <- callAlterationsFromSegmentation(sampleid = seg$ID, chr = seg$chrom, 
start = seg$loc.start, end = seg$loc.end, num.mark = seg$num.mark, 
seg.mean = seg$seg.mean, C = seg$C, interval.file = interval.file)

---

\textbf{callAmplificationsInLowPurity}  
\textit{Calling of amplifications in low purity samples}

\textbf{Description}

Function to extract amplification from a \texttt{runAbsoluteCN} return object in samples of too low purity for the standard \texttt{callAlterations}.

\textbf{Usage}

callAmplificationsInLowPurity(
  res, 
  normalDB, 
  pvalue.cutoff = 0.001, 
  percentile.cutoff = 90, 
  min.width = 3, 
  all.genes = FALSE, 
  purity = NULL, 
  BPPARAM = NULL
)
Arguments

- `res`: Return object of the `runAbsoluteCN` function.
- `normalDB`: Normal database, created with `createNormalDatabase`.
- `pvalue.cutoff`: Copy numbers log-ratio cutoffs to call amplifications as calculating using the log-ratios observed in `normalDB`.
- `percentile.cutoff`: Only report genes with log2-ratio mean exceeding this sample-wise cutoff.
- `min.width`: Minimum number of targets.
- `all.genes`: If `FALSE`, then only return amplifications passing the thresholds.
- `purity`: If not `NULL`, then scale log2-ratios to the corresponding integer copy number. Useful when accurate ctDNA fractions (between 4-10 percent) are available.
- `BPPARAM`: BiocParallelParam object. If `NULL`, does not use parallelization for fitting local optima.

Value

A data.frame with gene-level amplification calls.

  package = "PureCN")
normal.coverage.files <- c(normal.coverage.file, normal2.coverage.file)
normalDB <- createNormalDatabase(normal.coverage.files)
callAmplificationsInLowPurity(purecn.example.output, normalDB)["EIF2A", ]
```

---

callCIN

**Call Chromosomal Instability**

Description

This function provides detailed CIN information.
callCIN

Usage

callCIN(
   res,
   id = 1,
   allele.specific = TRUE,
   reference.state = c("dominant", "normal")
)

Arguments

   res                  Return object of the runAbsoluteCN function.
   id                   Candidate solution to extract CIN from. id=1 will use the maximum likelihood solution.
   allele.specific      Use allele-specific or only total copy number for detecting abnormal regions. Copy-number neutral LOH would be ignored when this parameter is set to FALSE.
   reference.state      Copy number regions different from the reference state are counted as abnormal. Default is dominant means the most common state. The other option is normal, which defines normal heterozygous, diploid as reference. The default is robust to errors in ploidy.

Value

   Returns double(1) with CIN value.

Author(s)

   Markus Riester

See Also

   runAbsoluteCN

Examples

data(purecn.example.output)
head(callCIN(purecn.example.output))
callLOH  

Get regions of LOH

Description

This function provides detailed LOH information by region.

Usage

callLOH(res, id = 1, arm.cutoff = 0.9, keep.no.snp.segments = TRUE)

Arguments

res  
Return object of the runAbsoluteCN function.

id  
Candidate solution to extract LOH from. id=1 will use the maximum likelihood solution.

arm.cutoff  
Min fraction LOH on a chromosome arm to call whole arm events.

keep.no.snp.segments  
Segments without heterozygous SNPs have no LOH information. This defines whether these segments should be reported anyways.

Value

Returns data.frame with LOH regions.

Author(s)

Markus Riester

See Also

runAbsoluteCN

Examples

data(purecn.example.output)
head(callLOH(purecn.example.output))
callMutationBurden  

**Description**

This function provides detailed mutation burden information.

**Usage**

```r
callMutationBurden(
  res,
  id = 1,
  remove.flagged = TRUE,
  min.prior.somatic = 0.1,
  max.prior.somatic = 1,
  min.cellfraction = 0,
  fun.countMutation = function(vcf) width(vcf) == 1,
  callable = NULL,
  exclude = NULL
)
```

**Arguments**

- `res`  
  Return object of the `runAbsoluteCN` function.

- `id`  
  Candidate solution to extract mutation burden from. `id=1` will use the maximum likelihood solution.

- `remove.flagged`  
  Remove variants flagged by `predictSomatic`.

- `min.prior.somatic`  
  Exclude variants with somatic prior probability lower than this cutoff.

- `max.prior.somatic`  
  Exclude variants with somatic prior probability higher than this cutoff. This is useful for removing hotspot mutations in small panels that might inflate the mutation burden.

- `min.cellfraction`  
  Exclude variants with cellular fraction lower than this cutoff. These are subclonal mutations or artifacts with very low allelic fraction.

- `fun.countMutation`  
  Function that can be used to filter the input VCF further for filtering. For example to only keep missense mutations. Expects a logical vector indicating whether variant should be counted (TRUE) or not (FALSE). Default is to keep only single nucleotide variants.

- `callable`  
  GRanges object with callable genomic regions, for example obtained by ‘GATK CallableLoci’ BED file, imported with rtracklayer.

- `exclude`  
  GRanges object with genomic regions that should be excluded from the callable regions, for example intronic regions. Requires callable.
Value

Returns data.frame with mutation counts and sizes of callable regions.

Author(s)

Markus Riester

runAbsoluteCN predictSomatic

Examples

```r
data(purecn.example.output)
callMutationBurden(purecn.example.output)

# To calculate exact mutations per megabase, we can provide a BED
# file containing all callable regions
callableBed <- import(system.file("extdata", "example Callable.bed.gz", package = "PureCN"))

# We can exclude some regions for mutation burden calculation,
# for example intronic regions.
exclude <- GRanges(seqnames = "chr1", IRanges(start = 1, end = max(end(callableBed))))

# We can also exclude specific mutations by filtering the input VCF
myVcfFilter <- function(vcf) seqnames(vcf) ! = "chr2"

callsCallable <- callMutationBurden(purecn.example.output, callable = callableBed, exclude = exclude, 
fun.countMutation = myVcfFilter)
```

---

**centromeres**

* A list of data.frames containing centromere positions.

Description

A list of data.frames containing centromere positions for hg18, hg19 and hg38. Downloaded from the UCSC genome browser.

Usage

```r
data(centromeres)
```
correctCoverageBias

Value

A list with three data frames, "hg18", "hg19", and "hg38". Each contains three columns:

- **chrom**: a factor with levels chr1 chr10 chr11 chr12 chr13 chr14 chr15 chr16 chr17 chr18 chr19 chr2 chr20 chr21 chr22 chr3 chr4 chr5 chr6 chr7 chr8 chr9 chrX chrY
- **chromStart**: a numeric vector
- **chromEnd**: a numeric vector

References

The script `downloadCentromeres.R` in the extdata directory was used to generate the data frames.

Examples

```r
data(centromeres)
```

---

**correctCoverageBias**

*Correct for library-specific coverage biases*

Description

Takes as input coverage data and a mapping file for GC content and optionally replication timing. Will then normalize coverage data for GC-bias. Plots the pre and post normalization GC profiles.

Usage

```r
correctCoverageBias(
  coverage.file,
  interval.file,
  output.file = NULL,
  plot.bias = FALSE,
  plot.max.density = 50000,
  output.qc.file = NULL
)
```

Arguments

- **coverage.file**: Coverage file or coverage data parsed with the `readCoverageFile` function.
- **interval.file**: File providing GC content for each exon in the coverage files. First column in format CHR:START-END. Additional optional columns provide gene symbols, mappability and replication timing. This file is generated with the `preprocessIntervals` function.
- **output.file**: Optionally, write file with GC corrected coverage. Can be read with the `readCoverageFile` function.
- **plot.bias**: Optionally, plot profiles of the pre-normalized and post-normalized coverage. Provides a quick visual check of coverage bias.
createCurationFile

plot.max.density
By default, if the number of intervals in the probe-set is > 50000, uses a kernel
density estimate to plot the coverage distribution. This uses the stat_density
function from the ggplot2 package. Using this parameter, change the threshold
at which density estimation is applied. If the plot.bias parameter is set as
FALSE, this will be ignored.

output.qc.file  Write miscellaneous coverage QC metrics to file.

preprocessIntervals

Examples

normal.coverage.file <- system.file("extdata", "example_normal.txt.gz",
package = "PureCN")
interval.file <- system.file("extdata", "example_intervals.txt",
package = "PureCN")
coverage <- correctCoverageBias(normal.coverage.file, interval.file)

createCurationFile  Create file to curate PureCN results

Description
Function to create a CSV file that can be used to mark the correct solution in the output of a
runAbsoluteCN run.

Usage
createCurationFile(
  file.rds,
  overwrite.uncurated = TRUE,
  overwrite.curated = FALSE
)

Arguments

file.rds          Output of the runAbsoluteCN function, serialized with saveRDS.
overwrite.uncurated
Overwrite existing files unless flagged as ‘Curated’.
overwrite.curated
Overwrite existing files even if flagged as ‘Curated’.
createNormalDatabase

Value

A data.frame with the tumor purity and ploidy of the maximum likelihood solution.

Author(s)

Markus Riester

See Also

runAbsoluteCN

Examples

data(purecn.example.output)
file.rds <- "Sample1_PureCN.rds"
saveRDS(purecn.example.output, file = file.rds)
createCurationFile(file.rds)

createNormalDatabase

Create database of normal samples

Description

Function to create a database of normal samples, used to normalize tumor coverages.

Usage

createNormalDatabase(
  normal.coverage.files,
  sex = NULL,
  coverage.outliers = c(0.25, 4),
  min.coverage = 0.25,
  max.missing = 0.03,
  low.coverage = 15,
  optimal.off.target.counts = 120,
  plot = FALSE,
  ...
)

Arguments

normal.coverage.files  Vector with file names pointing to coverage files of normal samples.

sex  character(length(normal.coverage.files)) with sex for all files. F for female, M for male. If all chromosomes are diploid, specify diploid. If NULL, determine from coverage.
filterIntervals

coverage.outliers
Exclude samples with coverages below or above the specified cutoffs (fractions of the normal sample coverages median). Only for databases with more than 5 samples.

min.coverage
Exclude intervals with coverage lower than the specified fraction of the chromosome median in the pool of normals.

max.missing
Exclude intervals with zero coverage in the specified fraction of normal samples.

low.coverage
Specifies the maximum number of total reads (NOT average coverage) to call a target low coverage.

optimal.off.target.counts
Used to suggest an optimal off-target interval width (BETA).

plot
Diagnostics plot, useful to tune parameters.

Value
A normal database that can be used in the calculateTangentNormal function to retrieve a coverage normalization sample for a given tumor sample.

Author(s)
Markus Riester

See Also
calculateTangentNormal

Examples

```r
normal.coverage.file <- system.file("extdata", "example_normal.txt.gz",
  package = "PureCN")
normal2.coverage.file <- system.file("extdata", "example_normal2.txt.gz",
  package = "PureCN")
normal.coverage.files <- c(normal.coverage.file, normal2.coverage.file)
normalDB <- createNormalDatabase(normal.coverage.files)
```

Description
This function determines which intervals in the coverage files should be included or excluded in the segmentation. It is called via the fun.filterIntervals argument of runAbsoluteCN. The arguments are passed via args.filterIntervals.
Usage

filterIntervals(
  normal,
  tumor,
  log.ratio,
  seg.file,
  filter.lowhigh.gc = 0.001,
  min.coverage = 15,
  min.total.counts = 100,
  min.targeted.base = 5,
  min.mappability = c(0.6, 0.1),
  min.fraction.offtarget = 0.05,
  normalDB = NULL
)

Arguments

normal Coverage data for normal sample.
tumor Coverage data for tumor sample.
log.ratio Copy number log-ratios, one for each interval in the coverage file.
seg.file If not NULL, then do not filter intervals, because data is already segmented via the provided segmentation file.
filter.lowhigh.gc Quantile q (defines lower q and upper 1-q) for removing intervals with outlier GC profile. Assuming that GC correction might not have been worked on those. Requires interval.file.
min.coverage Minimum coverage in both normal and tumor. Intervals with lower coverage are ignored. If a normalDB is provided, then this database already provides information about low quality intervals and the min.coverage is set to min.coverage/10000.
min.total.counts Exclude intervals with fewer than that many reads in combined tumor and normal.
min.targeted.base Exclude intervals with targeted base (size in bp) smaller than this cutoff. This is useful when the same interval file was used to calculate GC content. For such small targets, the GC content is likely very different from the true GC content of the probes.
min.mappability double(2) specifying the minimum mappability score for on-target, off-target in that order.
min.fraction.offtarget Skip off-target regions when less than the specified fraction of all intervals passes all filters.
normalDB Normal database, created with createNormalDatabase.
Value

logical(length(log.ratio)) specifying which intervals should be used in segmentation.

Author(s)

Markus Riester

Examples

normal.coverage.file <- system.file("extdata", "example_normal.txt.gz", package = "PureCN")
normal2.coverage.file <- system.file("extdata", "example_normal2.txt.gz", package = "PureCN")
normal.coverage.files <- c(normal.coverage.file, normal2.coverage.file)
normalDB <- createNormalDatabase(normal.coverage.files)

tumor.coverage.file <- system.file("extdata", "example_tumor.txt.gz", package = "PureCN")
vcf.file <- system.file("extdata", "example.vcf.gz", package = "PureCN")
interval.file <- system.file("extdata", "example_intervals.txt", package = "PureCN")

# The max.candidate.solutions, max.ploidy and test.purity parameters are set to # non-default values to speed-up this example. This is not a good idea for real # samples.
ret <- runAbsoluteCN(normal.coverage.file = normal.coverage.file, tumor.coverage.file = tumor.coverage.file, genome = "hg19", vcf.file = vcf.file, normalDB = normalDB, sampleid = "Sample1", interval.file = interval.file, args.filterIntervals = list(min.targeted.base = 10), max.ploidy = 4, test.purity = seq(0.3, 0.7, by = 0.05), max.candidate.solutions = 1)
contamination.range = c(0.01, 0.075),
min.coverage = 15,
min.base.quality = 25,
max.base.quality = 50,
base.quality.offset = 1,
min.supporting.reads = NULL,
error = 0.001,
target.granges = NULL,
remove.off.target.snvs = TRUE,
model.homozygous = FALSE,
interval.padding = 50,
DB.info.flag = "DB"
)

Arguments

vcf CollapsedVCF object, read in with the readVcf function from the VariantAnnotation package.
tumor.id.in.vcf The tumor id in the CollapsedVCF (optional).
use.somatic.status If somatic status and germline data is available, then use this information to remove non-heterozygous germline SNPs or germline SNPs with biased allelic fractions.
snp.blacklist A file with blacklisted genomic regions. Must be parsable by import from rtracklayer, for example a BED file with file extension '.bed'.
af.range Exclude variants with allelic fraction smaller or greater than the two values, respectively. The higher value removes homozygous SNPs, which potentially have allelic fractions smaller than 1 due to artifacts or contamination. If a matched normal is available, this value is ignored, because homozygosity can be confirmed in the normal.
contamination.range Count variants in dbSNP with allelic fraction in the specified range. If the number of these putative contamination variants exceeds an expected value and if they are found on almost all chromosomes, the sample is flagged as potentially contaminated and extra contamination estimation steps will be performed later on.
min.coverage Minimum coverage in tumor. Variants with lower coverage are ignored.
min.base.quality Minimum base quality in tumor. Requires a BQ genotype field in the VCF. Values below this value will be ignored.
max.base.quality Maximum base quality in tumor. Requires a BQ genotype field in the VCF. Variants exceeding this value will have their BQ capped at this value.
base.quality.offset Subtracts the specified value from the base quality score. Useful to add some cushion for too optimistically calibrated scores. Requires a BQ genotype field in the VCF.
filterVcfBasic

min.supporting.reads
Minimum number of reads supporting the alt allele. If NULL, calculate based on coverage and assuming sequencing error of 10^-3.

error
Estimated sequencing error rate. Used to calculate minimum number of supporting reads using calculatePowerDetectSomatic when base quality scores are not available.

target.granges GenomicRanges object specifying the target positions. Used to remove off-target reads. If NULL, do not check whether variants are on or off-target.

remove.off.target.snvs
If set to a true value, will remove all SNVs outside the covered regions.

model.homozygous
If set to TRUE, does not remove homozygous variants. Ignored in case a matched normal is provided in the VCF.

interval.padding
Include variants in the interval flanking regions of the specified size in bp. Requires target.granges.

DB.info.flag
Flag in INFO of VCF that marks presence in common germline databases. Defaults to DB that may contain somatic variants if it is from an unfiltered dbSNP VCF.

Value
A list with elements

vcf The filteredCollapsedVCF object.
flag A flag (logical(1)) if problems were identified.
flag_comment A comment describing the flagging.

calculatePowerDetectSomatic

Examples

# This function is typically only called by runAbsolute via
# fun.filterVcf and args.filterVcf.
vcf.file <- system.file("extdata", "example.vcf.gz", package="PureCN")
vcf <- readVcf(vcf.file, "hg19")
vcf.filtered <- filterVcfBasic(vcf)
Description

Function to remove artifacts and low confidence/quality calls from a MuTect generated VCF file. Also applies filters defined in filterVcfBasic. This function will only keep variants listed in the stats file and those not matching the specified failure reasons.

Usage

```r
filterVcfMuTect(
  vcf,
  tumor.id.in.vcf = NULL,
  stats.file = NULL,
  ignore = c("clustered_read_position", "fstar_tumor_lod", "nearby_gap_events",
             "poor_mapping_region_alternate_allele_mapq", "poor_mapping_region_mapq0",
             "possible_contamination", "strand_artifact", "seen_in_panel_of_normals"),
  ...
)
```

Arguments

- **vcf**: CollapsedVCF object, read in with the `readVcf` function from the VariantAnnotation package.
- **tumor.id.in.vcf**: The tumor id in the VCF file, optional.
- **stats.file**: MuTect stats file. If NULL, will check if VCF was generated by MuTect2 and if yes will call `filterVcfMuTect2` instead.
- **ignore**: MuTect flags that mark variants for exclusion.
- **...**: Additional arguments passed to `filterVcfBasic`.

Value

A list with elements `vcf`, `flag` and `flag_comment`. `vcf` contains the filtered CollapsedVCF. `flag` a logical(1) flag if problems were identified, further described in `flag_comment`.

Author(s)

Markus Riester

See Also

`filterVcfBasic`
filterVcfMuTect2

Description

Function to remove artifacts and low confidence/quality calls from a GATK4/MuTect2 generated VCF file. Also applies filters defined in filterVcfBasic.

Usage

```r
filterVcfMuTect2(
  vcf,
  tumor.id.in.vcf = NULL,
  ignore = c("clustered_events", "t_lod", "str_contraction", "read_position", "position",
             "fragment_length", "multiallelic", "clipping", "strand_artifact", "strand_bias",
             "slippage", "weak_evidence", "orientation", "haplotype"),
  ...
)
```

Arguments

- `vcf` CollapsedVCF object, read in with the readVcf function from the VariantAnnotation package.
- `tumor.id.in.vcf` The tumor id in the VCF file, optional.
- `ignore` MuTect2 flags that mark variants for exclusion.
- `...` Additional arguments passed to `filterVcfBasic`.

Value

A list with elements `vcf`, `flag` and `flag_comment`. `vcf` contains the filtered CollapsedVCF, `flag` a logical(1) flag if problems were identified, further described in `flag_comment`.

Author(s)

Markus Riester
**findFocal**

**Description**

Function to find focal amplifications in segmented data. This is automatically called in `runAbsoluteCN`.

**Usage**

```r
findFocal(seg, max.size = 3e+06, cn.diff = 2, min.amp.cn = 5)
```

**Arguments**

- `seg`: Segmentation data.
- `max.size`: Cutoff for focal in base pairs.
- `cn.diff`: Minimum copy number delta between neighboring segments.
- `min.amp.cn`: Minimum amplification integer copy number. Segments with lower copy number are not tested.

**Value**

`logical(n)`, indicating for all n segments whether they are focally amplified or not.

**Author(s)**

Markus Riester

getSexFromCoverage

Examples

```r
normal.coverage.file <- system.file("extdata", "example_normal_tiny.txt",
                                  package = "PureCN")
tumor.coverage.file <- system.file("extdata", "example_tumor_tiny.txt",
                                   package = "PureCN")
vcf.file <- system.file("extdata", "example.vcf.gz",
                         package = "PureCN")
interval.file <- system.file("extdata", "example_intervals_tiny.txt",
                            package = "PureCN")

# The max.candidate.solutions, max.ploidy and test.purity parameters are set to
# non-default values to speed-up this example. This is not a good idea for real
# samples.
ret <- runAbsoluteCN(normal.coverage.file = normal.coverage.file,
                     tumor.coverage.file = tumor.coverage.file, vcf.file = vcf.file,
                     genome="hg19", sampleid = "Sample1", interval.file = interval.file,
                     max.candidate.solutions = 1, max.ploidy = 4,
                     test.purity = seq(0.3, 0.7, by = 0.05),
                     args.focal=list(max.size = 2e+06), fun.focal = findFocal)
```

getSexFromCoverage

Get sample sex from coverage

Description

This function determines the sex of a sample by the coverage ratio of chrX and chrY. Loss of chromosome Y (LOY) can result in a wrong female call. For small targeted panels, this will only work when sufficient sex marker genes such as AMELY are covered. For optimal results, parameters might need to be tuned for the assay.

Usage

```r
getSexFromCoverage(
  coverage.file,
  min.ratio = 25,
  min.ratio.na = 20,
  remove.outliers = TRUE
)
```

Arguments

- **coverage.file**: Coverage file or data read with `readCoverageFile`.
- **min.ratio**: Min chrX/chrY coverage ratio to call sample as female.
- **min.ratio.na**: Min chrX/chrY coverage ratio to call sample as NA. This ratio defines a grey zone from `min.ratio.na` to `min.ratio` in which samples are not called. The default is set to a copy number ratio that would be rare in male samples, but lower
getSexFromVcf

than expected in female samples. Contamination can be a source of ambiguous calls. Mappability issues on chromosome Y resulting in low coverage need to be considered when setting cutoffs.

remove.outliers

Removes coverage outliers before calculating mean chromosome coverages.

Value

Returns a character(1) with M for male, F for female, or NA if unknown.

Author(s)

Markus Riester

See Also

getSexFromVcf

Examples

tumor.coverage.file <- system.file("extdata", "example_tumor.txt.gz", package = "PureCN")
sex <- getSexFromCoverage(tumor.coverage.file)

getSexFromVcf  Get sample sex from a VCF file

Description

This function detects non-random distribution of homozygous variants on chromosome X compared to all other chromosomes. A non-significant Fisher's exact p-value indicates more than one chromosome X copy. This function is called in runAbsoluteCN as sanity check when a VCF is provided. It is also useful for determining sex when no sex marker genes on chrY (e.g. AMELY) are available.

Usage

getSexFromVcf(
  vcf,
  tumor.id.in.vcf = NULL,
  min.or = 4,
  min.or.na = 2.5,
  max.pv = 0.001,
  homozygous.cutoff = 0.95,
  af.cutoff = 0.2,
  min.coverage = 15,
  use.somatic.status = TRUE
)
**getSexFromVcf**

**Arguments**

- **vcf**  
  CollapsedVCF object, read in with the `readVcf` function from the VariantAnnotation package.

- **tumor.id.in.vcf**  
  The tumor id in the CollapsedVCF (optional).

- **min.or**  
  Minimum odds-ratio to call sample as male. If p-value is not significant due to a small number of SNPs on chromosome X, sample will be called as NA even when odds-ratio exceeds this cutoff.

- **min.or.na**  
  Minimum odds-ratio to not call a sample. Odds-ratios in the range `min.or.na` to `min.or` define a grey area in which samples are not called. Contamination can be a source of ambiguous calls.

- **max.pv**  
  Maximum Fisher's exact p-value to call sample as male.

- **homozygous.cutoff**  
  Minimum allelic fraction to call position homozygous.

- **af.cutoff**  
  Remove all SNVs with allelic fraction lower than the specified value.

- **min.coverage**  
  Minimum coverage in tumor. Variants with lower coverage are ignored.

- **use.somatic.status**  
  If somatic status and germline data is available, then exclude somatic variants.

**Value**

Returns a character(1) with `M` for male, `F` for female, or `NA` if unknown.

**Author(s)**

Markus Riester

**See Also**

- `getSexFromCoverage`

**Examples**

```r
vcf.file <- system.file("extdata", "example.vcf.gz", package = "PureCN")
vcf <- readVcf(vcf.file, "hg19")
# This example vcf is filtered and contains no homozygous calls,
# which are necessary for determining sex from chromosome X.
getSexFromVcf(vcf)
```
Description

This function provides various plots for finding correct purity and ploidy combinations in the results of a runAbsoluteCN call.

Usage

plotAbs(
  res,
  id = 1,
  type = c("hist", "overview", "BAF", "AF", "all"),
  chr = NULL,
  germline.only = TRUE,
  show.contour = FALSE,
  purity = NULL,
  ploidy = NULL,
  alpha = TRUE,
  show.segment.means = c("SNV", "segments", "both"),
  max.mapping.bias = 0.8,
  palette.name = "Paired",
  col.snps = "#2b6391",
  col.chr.shading = "#f0f0f0",
  ...
)

Arguments

res  Return object of the runAbsoluteCN function.
id  Candidate solutions to be plotted. id=1 will draw the plot for the maximum likelihood solution.
type Different types of plots. hist will plot a histogram, assigning log-ratio peaks to integer values. overview will plot all local optima, sorted by likelihood. BAF plots something like a B-allele frequency plot known from SNP arrays: it plots allele frequencies of germline variants (or most likely germline when status is not available) against copy number. AF plots observed allelic fractions against expected (purity), maximum likelihood (optimal multiplicity) allelic fractions. all plots types BAF and AF for all local optima, and is useful for generating a PDF for manual inspection.
chr  If NULL, show all chromosomes, otherwise only the ones specified (type="BAF" only).
germline.only If TRUE, show only variants most likely being germline in BAF plot. Useful to set to FALSE (in combination with chr) to study potential artifacts.
show.contour  For type="overview", display contour plot.

purity Display expected integer copy numbers for purity, defaults to purity of the solution (type="hist" and "AF" only).

ploidy Display expected integer copy numbers for ploidy, defaults to ploidy of the solution (type="hist" and "AF" only).

alpha Add transparency to the plot if VCF contains many variants (>2000, type="AF" and type="BAF" only).

show.segment.means Show segment means in germline allele frequency plot? If both, show SNVs and segment means. If SNV show all SNVs. Only for type="AF".

max.mapping.bias Exclude variants with high mapping bias from plotting. Note that bias is reported on an inverse scale; a variant with mapping bias of 1 has no bias. (type="AF" and type="BAF" only).

col.snps The color used for germline SNPs.

col.chr.shading The color used for shading alternate chromosomes.

... Additonal parameters passed to the plot function.

Value

Returns NULL.

plotAbs(purecn.example.output, 1, type="BAF")
plotAbs(purecn.example.output, 1, type = "BAF", chr="chr2")
poolCoverage

Pool coverage from multiple samples

Description

Averages the coverage of a list of samples.

Usage

poolCoverage(all.data, remove.chrs = c(), w = NULL)

Arguments

all.data      List of normals, read with readCoverageFile.
remove.chrs   Remove these chromosomes from the pool.
w            numeric(length(all.data)) vector of weights. If NULL, weight all samples equally.

Value

A data.frame with the averaged coverage over all normals.

Author(s)

Markus Riester

readCoverageFile

Examples

normal.coverage.file <- system.file("extdata", "example_normal.txt.gz", 
                                   package = "PureCN")
normal2.coverage.file <- system.file("extdata", "example_normal2.txt.gz", 
                                    package = "PureCN")
normal.coverage.files <- c(normal.coverage.file, normal2.coverage.file)
pool <- poolCoverage(lapply(normal.coverage.files, readCoverageFile), 
                      remove.chrs = c("chrX", "chrY"))
predictSomatic  

**Predict germline vs. somatic status**

**Description**

This function takes as input the output of a `runAbsoluteCN` run and provides SNV posterior probabilities for all possible states.

**Usage**

```r
predictSomatic(res, id = 1, return.vcf = FALSE)
```

**Arguments**

- `res`  
  Return object of the `runAbsoluteCN` function.
- `id`  
  Candidate solutions to be analyzed. `id=1` will analyze the maximum likelihood solution.
- `return.vcf`  
  Returns an annotated `CollapsedVCF` object. Note that this VCF will only contain variants not filtered out by the `filterVcf` functions. Variants outside segments or intervals might be included or not depending on `runAbsoluteCN` arguments.

**Value**

A `data.frame` or `CollapsedVCF` with SNV state posterior probabilities.

**Author(s)**

Markus Riester

**See Also**

`runAbsoluteCN`

**Examples**

```r
data(purecn.example.output)
# the output data was created using a matched normal sample, but in case
# no matched normal is available, this will help predicting somatic vs.
# germline status
purecnSnvs <- predictSomatic(purecn.example.output)

# Prefer GRanges?
purecnSnvs <- GRanges(predictSomatic(purecn.example.output))

# write a VCF file
purecnVcf <- predictSomatic(purecn.example.output, return.vcf=TRUE)
writeVcf(purecnVcf, file = "Sample1_PureCN.vcf")
```
Description

Optimize intervals for copy number calling by tiling long intervals and by including off-target regions. Uses scanFa from the Rsamtools package to retrieve GC content of intervals in a reference FASTA file. If provided, will annotate intervals with mappability and replication timing scores.

Usage

preprocessIntervals(
  interval.file, 
  reference.file, 
  output.file = NULL, 
  off.target = FALSE, 
  average.target.width = 400, 
  min.target.width = 100, 
  min.off.target.width = 20000, 
  average.off.target.width = 2e+05, 
  off.target.padding = -500, 
  mappability = NULL, 
  min.mappability = c(0.6, 0.1, 0.7), 
  reptiming = NULL, 
  average.reptiming.width = 1e+05, 
  exclude = NULL, 
  off.target.seqlevels = c("targeted", "all"), 
  small.targets = c("resize", "drop")
)

Arguments

interval.file File specifying the intervals. Interval is expected in first column in format CHR:START-END. Instead of a file, a GRanges object can be provided. This allows the use of BED files for example. Note that GATK interval files are 1-based (first position of the genome is 1). Other formats like BED files are often 0-based. The import function will automatically convert to 1-based GRanges.

reference.file Reference FASTA file.

output.file Optionally, write GC content file.

off.target Include off-target regions.

average.target.width Split large targets to approximately this size.

min.target.width Make sure that target regions are of at least this specified width. See small.targets.

min.off.target.width Only include off-target regions of that size.
average.off.target.width
   Split off-target regions to that
off.target.padding
   Pad off-target regions.
mappability
   Annotate intervals with mappability score. Assumed on a scale from 0 to 1, with
targets being 1/(number alignments). Expected as GRanges object with first meta
column being the score. Regions outside these ranges are ignored, assuming
that mappability covers the whole accessible genome.
min.mappability
   double(3) specifying the minimum mappability score for on-target, off-target,
and chrY regions in that order. The chrY regions are only used for sex determi-
nation in ‘PureCN’ and are therefore treated differently. Requires mappability.
reptiming
   Annotate intervals with replication timing score. Expected as GRanges object
with first meta column being the score.
average.reptiming.width
   Tile reptiming into bins of specified width.
exclude
   Any target that overlaps with this GRanges object will be excluded.
off.target.seqlevels
   Controls how to deal with chromosomes/contigs found in the reference.file
but not in the interval.file.
small.targets
   Strategy to deal with targets smaller than min.target.width.

Value
   Returns GC content by interval as GRanges object.

processMultipleSamples

*Multi sample normalization and segmentation*

**Description**

This function performs normalization and segmentation when multiple samples are available.

**Usage**

```r
processMultipleSamples(
  tumor.coverage.files,
  sampleids,
  normalDB,
  num.eigen = 20,
  genome,
  plot.cnv = TRUE,
  w = NULL,
  min.interval.weight = 1/3,
  max.segments = NULL,
  chr.hash = NULL,
  centromeres = NULL,
  ...
)
```

**Arguments**

- `tumor.coverage.files`: Coverage data for tumor samples.
- `sampleids`: Sample ids, used in output files.
- `normalDB`: Database of normal samples, created with `createNormalDatabase`.
- `num.eigen`: Number of eigen vectors used.
- `genome`: Genome version, for example hg19. Needed to get centromere positions.
- `plot.cnv`: Segmentation plots.
- `w`: Weight of samples. Can be used to downweight poor quality samples. If `NULL`, sets to inverse of median on-target duplication rate if available, otherwise does not do any weighting.
- `min.interval.weight`: Can be used to ignore intervals with low weights.
- `max.segments`: If not `NULL`, try a higher `undo.SD` parameter if number of segments exceeds the threshold.
- `chr.hash`: Mapping of non-numerical chromosome names to numerical names (e.g. chr1 to 1, chr2 to 2, etc.). If `NULL`, assume chromosomes are properly ordered.
- `centromeres`: A GRanges object with centromere positions.
- `...`: Arguments passed to the segmentation function.
Details

CURRENTLY DEFUNCT BECAUSE IT DEPENDS ON THE DEFUNCT COPYNUMBER PACKAGE. We are working on a replacement.

Value

data.frame containing the segmentation.

Examples

```r
normal1.coverage.file <- system.file("extdata", "example_normal.txt.gz", package = "PureCN")
normal2.coverage.file <- system.file("extdata", "example_normal2.txt.gz", package = "PureCN")
tumor1.coverage.file <- system.file("extdata", "example_tumor.txt.gz", package = "PureCN")
tumor2.coverage.file <- system.file("extdata", "example_tumor2.txt.gz", package = "PureCN")

normal.coverage.files <- c(normal1.coverage.file, normal2.coverage.file)
tumor.coverage.files <- c(tumor1.coverage.file, tumor2.coverage.file)

normalDB <- createNormalDatabase(normal.coverage.files)

# seg <- processMultipleSamples(tumor.coverage.files,
# sampleids = c("Sample1", "Sample2"),
# normalDB = normalDB,
# genome = "hg19")
```
**PureCN-defunct**

**Defunct functions in package ‘PureCN’**

**Description**

These functions are defunct and no longer available.

**Details**

The following functions are defunct; use the replacement indicated below:

- `autoCurateResults`: no replacement
- `calculateGCContentByInterval`: `preprocessIntervals`
- `calculateIntervalWeights`: `createNormalDatabase`
- `createExonWeightFile`: `createNormalDatabase`
- `createSNPBlacklist`: `setMappingBiasVcf`
- `createTargetWeights`: `createNormalDatabase`
- `filterTargets`: `filterIntervals`
- `findBestNormal`: `calculateTangentNormal`
- `getDiploid`: no replacement
- `plotBestNormal`: no replacement
- `readCoverageGatk`: `readCoverageFile`

---

**PureCN-deprecated**

**Deprecated functions in package ‘PureCN’**

**Description**

These functions are provided for compatibility with older versions of ‘PureCN’ only, and will be defunct at the next release.

**Details**

The following functions are deprecated and will be made defunct; use the replacement indicated below:
Description
This provides the output of the `DNAcopy::getbdry` call using `segmentationCBS` default parameters.

Usage
```r
data(purecn.DNAcopy.bdry)
```

Value
Output of the `DNAcopy::getbdry` call.

Description
This provides the output of the `runAbsoluteCN` call used in the vignette and examples.

Usage
```r
data(purecn.example.output)
```

Value
Output of the `runAbsoluteCN` call used in the vignette.

Description
Read file containing counts of ref and alt alleles of common Toolkit 4.

Usage
```r
readAllelicCountsFile(file, format, zero = NULL)
```
readCoverageFile

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Input file containing counts of ref and alt alleles</td>
</tr>
<tr>
<td>format</td>
<td>File format. If missing, derived from the file extension. Currently only GATK4 CollectAllelicCounts (tsv) format supported.</td>
</tr>
<tr>
<td>zero</td>
<td>Start position is 0-based. Default is FALSE for GATK, TRUE for BED file based intervals.</td>
</tr>
</tbody>
</table>

Value

A CollapsedVCF with the parsed allelic counts.

Author(s)

Markus Riester

Examples

```r
ac.file <- system.file("extdata", "example_allelic_counts.tsv", package="PureCN")
vcf_ac <- readAllelicCountsFile(ac.file)
```

Description

Read coverage file produced by external tools like The Genome Analysis Toolkit or by calculateBamCoverageByInterval.

Usage

```r
readCoverageFile(file, format, zero = NULL, read.length = 100)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file</td>
<td>Target coverage file.</td>
</tr>
<tr>
<td>format</td>
<td>File format. If missing, derived from the file extension. Currently GATK3 DepthOfCoverage, GATK4 CollectFragmentCounts (hdf5), and CNVkit formats supported.</td>
</tr>
<tr>
<td>zero</td>
<td>Start position is 0-based. Default is FALSE for GATK, TRUE for BED file based intervals.</td>
</tr>
<tr>
<td>read.length</td>
<td>For output formats which do not provide both counts and total coverages, approximate them using the specified read length.</td>
</tr>
</tbody>
</table>

Value

A data.frame with the parsed coverage information.
Author(s)
Markus Riester

calculateBamCoverageByInterval

Examples
tumor.coverage.file <- system.file("extdata", "example_tumor.txt.gz",
package = "PureCN")
coverage <- readCoverageFile(tumor.coverage.file)

readCurationFile
Read curation file

Description
Function that can be used to read the curated output of the runAbsoluteCN function.

Usage
readCurationFile(
  file.rds,
  file.curation = gsub(".rds$", ".csv", file.rds),
  remove.failed = FALSE,
  report.best.only = FALSE,
  min.ploidy = NULL,
  max.ploidy = NULL
)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file.rds</td>
<td>Output of the runAbsoluteCN function, serialized with saveRDS.</td>
</tr>
<tr>
<td>file.curation</td>
<td>Filename of a curation file that points to the correct tumor purity and ploidy solution.</td>
</tr>
<tr>
<td>remove.failed</td>
<td>Do not return solutions that failed.</td>
</tr>
<tr>
<td>report.best.only</td>
<td>Only return correct/best solution (useful on low memory machines when lots of samples are loaded).</td>
</tr>
<tr>
<td>min.ploidy</td>
<td>Minimum ploidy to be considered. If NULL, all. Can be used to automatically ignore unlikely solutions.</td>
</tr>
<tr>
<td>max.ploidy</td>
<td>Maximum ploidy to be considered. If NULL, all. Can be used to automatically ignore unlikely solutions.</td>
</tr>
</tbody>
</table>
readIntervalFile

Value

The return value of the corresponding `runAbsoluteCN` call, but with the results array manipulated according the curation CSV file and arguments of this function.

Author(s)

Markus Riester

See Also

`runAbsoluteCN` `createCurationFile`

Examples

data(purecn.example.output)
file.rds <- "Sample1_PureCN.rds"
createCurationFile(file.rds)
# User can change the maximum likelihood solution manually in the generated
# CSV file. The correct solution is then loaded with readCurationFile.
purecn.curated.example.output <- readCurationFile(file.rds)

---

readIntervalFile  Read interval file

Description

Read file containing coordinates of on- and off-target intervals generated by `preprocessIntervals`.

Usage

`readIntervalFile(interval.file, strict = TRUE, verbose = TRUE)`

Arguments

interval.file  A mapping file that assigns GC content and gene symbols to each exon in the coverage files. Used for generating gene-level calls. First column in format CHR:START-END. Second column GC content (0 to 1). Third column gene symbol. This file is generated with the `preprocessIntervals` function.

strict  Error out with missing columns

verbose  Verbose output

Value

A GRanges object with the parsed intervals.
**readLogRatioFile**

Read file containing interval-level log2 tumor/normal ratios

---

**Description**

Read log2 ratio file produced by external tools like The Genome Analysis Toolkit version 4.

**Usage**

```r
readLogRatioFile(file, format, zero = NULL)
```

**Arguments**

- `file`  
  Log2 coverage file.

- `format`  
  File format. If missing, derived from the file extension. Currently GATK4 De-noiseReadCounts format supported. A simple GATK3-style format, two columns with coordinates as string in format chr:start-stop in first and log2-ratio in second is also supported.

- `zero`  
  Start position is 0-based. Default is FALSE for GATK, TRUE for BED file based intervals.

**Value**

A GRange with the log2 ratio.

**Author(s)**

Markus Riester

**Examples**

```r
logratio.file <- system.file("extdata", "example_gatk4_denoised_cr.tsv.gz", package = "PureCN")
logratio <- readLogRatioFile(logratio.file)
```
Description

Read segmentation files produced by DNACopy, CNVkit or GATK4.

Usage

readSegmentationFile(
  seg.file,
  sampleid,
  model.homozygous = FALSE,
  format,
  zero = FALSE,
  verbose = TRUE
)

Arguments

seg.file File with segmentation
sampleid Sampleid, for segmentation files containing multiple samples
model.homozygous Unless TRUE, checks for very small log2-ratios that cannot happen in samples with normal contamination
format File format. If missing, derived from the file extension. Currently DNACopy, and GATK4 (ModelSegments) format supported. CNVkit uses DNACopy format.
zero Start position is 0-based. Default is FALSE.
verbose Verbose output.

Value

A data.frame.

Author(s)

Markus Riester

Examples

seg.file <- system.file("extdata", "example_seg.txt",
  package = "PureCN")
seg <- readSegmentationFile(seg.file, "Sample1")
runAbsoluteCN

Run PureCN implementation of ABSOLUTE

Description

This function takes as input tumor and normal control coverage data and a VCF containing allelic fractions of germline variants and somatic mutations. Normal control does not need to be from the same patient. In case VCF does not contain somatic status, it should contain dbSNP and optionally COSMIC annotation. Returns purity and ploidy combinations, sorted by likelihood score. Provides copy number and LOH data, by both gene and genomic region.

Usage

```r
runAbsoluteCN(
  normal.coverage.file = NULL,
  tumor.coverage.file = NULL,
  log.ratio = NULL,
  seg.file = NULL,
  seg.file.sdev = 0.4,
  vcf.file = NULL,

Cosmic.CNT.info.field = "Cosmic.CNT",
min.pop.af = 0.001,
model = c("beta", "betabin"),
post.optimize = FALSE,
speedup.heuristics = 2,
BPPARAM = NULL,
log.file = NULL,
verbose = TRUE
)

Arguments

normal.coverage.file
Coverage file of normal control (optional if log.ratio is provided - then it will be only used to filter low coverage exons). Should be already GC-normalized with correctCoverageBias. Needs to be either a file name or data read with the readCoverageFile function.

tumor.coverage.file
Coverage file of tumor. If NULL, requires seg.file and an interval file via interval.file. Should be already GC-normalized with correctCoverageBias. Needs to be either a file name or data read with the readCoverageFile function.

log.ratio
Copy number log-ratios for all exons in the coverage files. If NULL, calculated based on coverage files.

seg.file
Segmented data. Optional, to support third-party segmentation tools. If NULL,
use coverage files or log.ratio to segment the data.

**seg.file.sdev**  If seg.file provided, the log-ratio standard deviation, used to model likelihood of sub-clonal copy number events.

**vcf.file**  VCF file. Optional, but typically needed to select between local optima of similar likelihood. Can also be a CollapsedVCF, read with the readVcf function. Requires a DB info flag for dbSNP membership. The default fun.setPriorVcf function will also look for a Cosmic.CNT slot (see cosmic.vcf.file), containing the hits in the COSMIC database. Again, do not expect very useful results without a VCF file.

**normalDB**  Normal database, created with createNormalDatabase. If provided, used to calculate gene-level p-values (requires Gene column in interval.file) and to filter targets with low coverage in the pool of normal samples.

**genome**  Genome version, for example hg19. See readVcf.

**centromeres**  A GRanges object with centromere positions. If NULL, use pre-stored positions for genome versions hg18, hg19 and hg38.

**sex**  Sex of sample. If ?, detect using getSexFromCoverage function and default parameters. Default parameters might not work well with every assay and might need to be tuned. If set to diploid, then PureCN will assume all chromosomes are diploid and will not try to detect sex.

**fun.filterVcf**  Function for filtering variants. Expected output is a list with elements vcf (CollapsedVCF), flag (logical(1)) and flag_comment (character(1)). The flags will be added to the output data and can be used to warn users, for example when samples look too noisy. Default filter will remove variants flagged by MuTect, but will keep germline variants. If ran in matched normal mode, it will by default use somatic status of variants and filter non-somatic calls with allelic fraction significantly different from 0.5 in normal. Defaults to filterVcfMuTect, which in turn also calls filterVcfBasic.

**args.filterVcf**  Arguments for variant filtering function. Arguments vcf, tumor.id.in.vcf, min.coverage, model.homozygous and error are required in the filter function and are automatically set.

**fun.setPriorVcf**  Function to set prior for somatic status for each variant in the VCF. Defaults to setPriorVcf.

**args.setPriorVcf**  Arguments for somatic prior function.

**fun.setMappingBiasVcf**  Function to set mapping bias for each variant in the VCF. Defaults to setMappingBiasVcf.

**args.setMappingBiasVcf**  Arguments for mapping bias function.

**fun.filterIntervals**  Function for filtering low-quality intervals in the coverage files. Needs to return a logical vector whether an interval should be used for segmentation. Defaults to filterIntervals.

**args.filterIntervals**  Arguments for target filtering function. Arguments normal, tumor, log.ratio, min.coverageseg.file and normalDB are required and automatically set.
fun.segmentation  
Function for segmenting the copy number log-ratios. Expected return value is a data.frame representation of the segmentation. Defaults to segmentationCBS.

args.segmentation  
Arguments for segmentation function. Arguments normal, tumor, log.ratio, plot.cnv, sampleid, vcf, tumor.id.in.vcf, centromeres are required in the segmentation function and automatically set.

fun.focal  
Function for identifying focal amplifications. Defaults to findFocal.

args.focal  
Arguments for focal amplification function.

sampleid  
Sample id, provided in output files etc.

min.ploidy  
Minimum ploidy to be considered.

max.ploidy  
Maximum ploidy to be considered.

test.num.copy  
Copy numbers tested in the grid search. Note that focal amplifications can have much higher copy numbers, but they will be labeled as subclonal (because they do not fit the integer copy numbers).

test.purity  
Considered tumor purity values.

prior.purity  
numeric(length(test.purity)) with priors for tested purity values. If NULL, use flat priors.

prior.K  
This defines the prior probability that the multiplicity of a SNV corresponds to either the maternal or the paternal copy number (for somatic variants additionally to a multiplicity of 1). For perfect segmentations, this value would be 1; values smaller than 1 thus may provide some robustness against segmentation errors.

prior.contamination  
The prior probability that a known SNP is from a different individual.

max.candidate.solutions  
Number of local optima considered in optimization and variant fitting steps. If there are too many local optima, it will use specified number of top candidate solutions, but will also include all optima close to diploid, because silent genomes have often lots of local optima.

candidates  
Candidates to optimize from a previous run (return.object$candidates). If NULL, do 2D grid search and find local optima.

min.coverage  
Minimum coverage in both normal and tumor. Intervals and variants with lower coverage are ignored. This value is provided to the args.filterIntervals and args.filterVcf lists, but can be overwritten in these lists if different cutoffs for the coverage and variant filters are wanted. To increase the sensitivity of homozygous deletions in high purity samples, the coverage cutoff in tumor is automatically lowered by 50 percent if the normal coverage is high.

max.coverage.vcf  
This will set the maximum number of reads in the SNV fitting. This is to avoid that small non-reference biases that come apparent only at high coverages have a dramatic influence on likelihood scores. Only relevant for model = "beta".

max.non.clonal  
Maximum genomic fraction assigned to a subclonal copy number state.
max.homozygous.loss
double(2) with maximum chromosome fraction assigned to homozygous loss and maximum size of a homozygous loss segment.

non.clonal.M  Average expected cellular fraction of sub-clonal somatic mutations. This is to calculate expected allelic fractions of a single sub-clonal bin for variants. For all somatic variants, more accurate cellular fractions are calculated.

max.mapping.bias  Exclude variants with high mapping bias from the likelihood score calculation. Note that bias is reported on an inverse scale; a variant with mapping bias of 1 has no bias.

max.pon  Exclude variants found more than max.pon times in pool of normals and not in dbSNP. Requires mapping.bias.file in setMappingBiasVcf. Should be set to a value high enough to be much more likely an artifact and not a true germline variant not present in dbSNP.

iterations  Maximum number of iterations in the Simulated Annealing copy number fit optimization. Note that this an integer optimization problem that should converge quickly. Allowed range is 10 to 250.

min.variants.segment  Flag segments with fewer variants. The minor copy number estimation is not reliable with insufficient variants.

log.ratio.calibration  Re-calibrate log-ratios in the window purity*log.ratio.calibration.

smooth.log.ratio  Smooth log.ratio using the DNAcopy package.

model.homozygous  Homozygous germline SNPs are uninformative and by default removed. In 100 percent pure samples such as cell lines, however, heterozygous germline SNPs appear homozygous in case of LOH. Setting this parameter to TRUE will keep homozygous SNPs and include a homozygous SNP state in the likelihood model. Not necessary when matched normal samples are available.

error  Estimated sequencing error rate. Used to calculate minimum number of supporting reads for variants using calculatePowerDetectSomatic. Also used to calculate the probability of homozygous SNP allelic fractions (assuming reference reads are sequencing errors).

interval.file  A mapping file that assigns GC content and gene symbols to each exon in the coverage files. Used for generating gene-level calls. First column in format CHR:START-END. Second column GC content (0 to 1). Third column gene symbol. This file is generated with the preprocessIntervals function.

max.dropout  Measures GC bias as ratio of coverage in AT-rich (GC < 0.5) versus GC-rich on-target regions (GC >= 0.5). High coverage drop-out might indicate that data was not GC-normalized (optional with larger pool of normal samples). A warning pointing to a normalized log-ratio drop-out likely indicates that the sample quality is insufficient. For log-ratio drop-out, a warning is thrown when half the max.dropout is reached since it is calculated using both tumor and normal. Requires interval.file.

min.logr.sdev  Minimum log-ratio standard deviation used in the model. Useful to make fitting more robust to outliers in very clean data.
max.logr.sdev  Flag noisy samples with segment log-ratio standard deviation larger than this. Assay specific and needs to be calibrated.
max.segments  Flag noisy samples with a large number of segments. Assay specific and needs to be calibrated.
min.gof  Flag purity/plodidy solutions with poor fit.
min.variants  Do not attempt to fit allelic fractions for samples with fewer variants passing all filters.
plot.cnv  Generate segmentation plots.
vcf.field.prefix  Prefix all newly created VCF field names with this string.
cosmic.vcf.file  Add a Cosmic.CNT info field to the provided vcf.file using a VCF file containing the COSMIC database. The default fun.setPriorVcf function will give variants found in the COSMIC database a higher prior probability of being somatic. Not used in likelihood model when matched normal is available in vcf.file. Should be compressed and indexed with bgzip and tabix, respectively.
DB.info.flag  Flag in INFO of VCF that marks presence in common germline databases. Defaults to DB that may contain somatic variants if it is from an unfiltered dbSNP VCF.
POPAF.info.field  As alternative to a flag, use an info field that contains population allele frequencies. The DB info flag has priority over this field when both exist.
Cosmic.CNT.info.field  Info field containing hits in the Cosmic database
min.pop.af  Minimum population allele frequency in POPAF.info.field to set a high germline prior probability.
model  Use either a beta or a beta-binomial distribution for fitting observed to expected allelic fractions of alterations in vcf.file. The latter can be useful to account for significant overdispersion, for example due to mapping biases when no pool of normals is available or due to other unmodeled biases, e.g. amplification biases. The beta-binomial model is only recommended with a sufficiently sized pool of normal samples (more than 10 normals)
post.optimize  Optimize purity using final SCNA-fit and variants. This might take a long time when lots of variants need to be fitted, but will typically result in a slightly more accurate purity, especially for rather silent genomes or very low purities. Otherwise, it will just use the purity determined via the SCNA-fit.
speedup.heuristics  Tries to avoid spending computation time on local optima that are unlikely correct. Set to 0 to turn this off, to 1 to only apply heuristics that in worst case will decrease accuracy slightly or to 2 to turn on all heuristics.
BPPARAM  BiocParallelParam object. If NULL, does not use parallelization for fitting local optima.
log.file  If not NULL, store verbose output to file.
verbose  Verbose output.
Value

A list with elements

- candidates: Results of the grid search.
- results: All local optima, sorted by final rank.
- input: The input data.

vcf.file <- system.file('extdata', 'example.vcf.gz', package = 'PureCN')
interval.file <- system.file('extdata', 'example_intervals_tiny.txt', package = 'PureCN')

# The max.candidate.solutions, max.ploidy and test.purity parameters are set to # non-default values to speed-up this example. This is not a good idea for real # samples.
ret <- runAbsoluteCN(normal.coverage.file = normal.coverage.file,
                      tumor.coverage.file = tumor.coverage.file, genome = 'hg19',
                      vcf.file = vcf.file, sampleid = 'Sample1',
                      interval.file = interval.file, max.ploidy = 4,
                      test.purity = seq(0.3, 0.7, by = 0.05), max.candidate.solutions = 1)

# If a high-quality segmentation was obtained with third-party tools:
seg.file <- system.file('extdata', 'example_seg.txt', package = 'PureCN')

# By default, PureCN will re-segment the data, for example to identify # regions of copy number neutral LOH. If this is not wanted, we can provide # a minimal segmentation function which just returns the provided one:
```
funSeg <- function(seg, ...) return(seg)

res <- runAbsoluteCN(seg.file = seg.file, fun.segmentation = funSeg,
                     max.ploidy = 4, test.purity = seq(0.3, 0.7, by = 0.05),
                     max.candidate.solutions = 1,
                     genome='hg19', interval.file = interval.file)

---

**segmentationCBS  CBS segmentation**

**Description**

The default segmentation function. This function is called via the `fun.segmentation` argument of `runAbsoluteCN`. The arguments are passed via `args.segmentation`.

**Usage**

```
segmentationCBS(
  normal,  # Coverage data for normal sample.
  tumor,   # Coverage data for tumor sample.
  log.ratio, # Copy number log-ratios, one for each target in the coverage files.
  seg,     #
  plot.cnv, #
  sampleid, #
  weight.flag.pvalue = 0.01, #
  alpha = 0.005, #
  undo.SD = NULL, #
  vcf = NULL, #
  tumor.id.in.vcf = 1, #
  normal.id.in.vcf = NULL, #
  max.segments = NULL, #
  min.logr.sdev = 0.15, #
  prune.hclust.h = NULL, #
  prune.hclust.method = "ward.D", #
  chr.hash = NULL, #
  additional.cmd.args = "", #
  centromeres = NULL #
)
```

**Arguments**

- **normal**: Coverage data for normal sample.
- **tumor**: Coverage data for tumor sample.
- **log.ratio**: Copy number log-ratios, one for each target in the coverage files.
If segmentation was provided by the user, this data structure will contain this segmentation. Useful for minimal segmentation functions. Otherwise PureCN will re-segment the data. This segmentation function ignores this user provided segmentation.

plot.cnv
Segmentation plots.

sampleid
Sample id, used in output files.

weight.flag.pvalue
Flag values with one-sided p-value smaller than this cutoff.

alpha
Alpha value for CBS, see documentation for the segment function.

undo.SD
undo.SD for CBS, see documentation of the segment function. If NULL, try to find a sensible default.

vcf
Optional CollapsedVCF object with germline allelic ratios.

tumor.id.in.vcf
Id of tumor in case multiple samples are stored in VCF.

normal.id.in.vcf
Id of normal in in VCF. Currently not used.

max.segments
If not NULL, try a higher undo.SD parameter if number of segments exceeds the threshold.

min.logr.sdev
Minimum log-ratio standard deviation used in the model. Useful to make fitting more robust to outliers in very clean data.

prune.hclust.h
Height in the hclust pruning step. Increasing this value will merge segments more aggressively. If NULL, try to find a sensible default.

prune.hclust.method
Cluster method used in the hclust pruning step. See documentation for the hclust function.

chr.hash
Mapping of non-numerical chromosome names to numerical names (e.g. chr1 to 1, chr2 to 2, etc.). If NULL, assume chromosomes are properly ordered.

additional.cmd.args
character(1). Ignored.

centromeres
A GRanges object with centromere positions. Currently not supported in this function.

Value
data.frame containing the segmentation.

### segmentationGATK4

#### GATK4 ModelSegments segmentation function

**Description**

A wrapper for GATK4's ModelSegmentation function, useful when normalization is performed with other tools than GATK4, for example PureCN. This function is called via the `fun.segmentation` argument of `runAbsoluteCN`. The arguments are passed via `args.segmentation`.

**Usage**

```r
segmentationGATK4(
  normal,
  tumor,
  log.ratio,
  seg,
  vcf = NULL,
  tumor.id.in.vcf = 1,
  normal.id.in.vcf = NULL,
  min.logr.sdev = 0.15,
  prune.hclust.h = NULL,
  prune.hclust.method = NULL,
```
changepoints.penalty = NULL,
additional.cmd.args = "",
chr.hash = NULL,
...
)

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>Coverage data for normal sample. Ignored in this function.</td>
</tr>
<tr>
<td>tumor</td>
<td>Coverage data for tumor sample.</td>
</tr>
<tr>
<td>log.ratio</td>
<td>Copy number log-ratios, one for each exon in coverage file.</td>
</tr>
<tr>
<td>seg</td>
<td>If segmentation was provided by the user, this data structure will contain this segmentation. Useful for minimal segmentation functions. Otherwise PureCN will re-segment the data. This segmentation function ignores this user provided segmentation.</td>
</tr>
<tr>
<td>vcf</td>
<td>Optional CollapsedVCF object with germline allelic ratios.</td>
</tr>
<tr>
<td>tumor.id.in.vcf</td>
<td>Id of tumor in case multiple samples are stored in VCF.</td>
</tr>
<tr>
<td>normal.id.in.vcf</td>
<td>Id of normal in in VCF. Currently not used.</td>
</tr>
<tr>
<td>min.logr.sdev</td>
<td>Minimum log-ratio standard deviation used in the model. Useful to make fitting more robust to outliers in very clean data.</td>
</tr>
<tr>
<td>prune.hclust.h</td>
<td>Ignored in this function.</td>
</tr>
<tr>
<td>prune.hclust.method</td>
<td>Ignored in this function.</td>
</tr>
<tr>
<td>changepoints.penalty</td>
<td>The --number-of-changepoints-penalty-factor. If NULL, find a sensible default. Ignored when provided in additional.cmd.args.</td>
</tr>
<tr>
<td>additional.cmd.args</td>
<td>character(1). By default, ModelSegments is called with default parameters. Provide additional arguments here.</td>
</tr>
<tr>
<td>chr.hash</td>
<td>Not needed here since ModelSegments does not require numbered chromosome names.</td>
</tr>
</tbody>
</table>

Value
data.frame containing the segmentation.

**Examples**

```r
normal.coverage.file <- system.file("extdata", "example_normal_tiny.txt", package="PureCN")
tumor.coverage.file <- system.file("extdata", "example_tumor_tiny.txt", package="PureCN")
vcf.file <- system.file("extdata", "example.vcf.gz", package="PureCN")

# The max.candidate.solutions, max.ploidy and test.purity parameters are set to
# non-default values to speed-up this example. This is not a good idea for real
# samples.
## Not run:
ret <- runAbsoluteCN(normal.coverage.file=normal.coverage.file,
tumor.coverage.file=tumor.coverage.file, vcf.file=vcf.file,
sampleid="Sample1", genome="hg19",
fun.segmentation = segmentationGATK4, max.ploidy=4,
args.segmentation = list(additional.cmd.args = "--gcs-max-retries 19"),
test.purity=seq(0.3,0.7,by=0.05), max.candidate.solutions=1)
## End(Not run)
```

---

**segmentationHclust**

*Minimal segmentation function*

**Description**

A minimal segmentation function useful when segmentation was performed by third-party tools. When a CollapsedVCF with germline SNPs is provided, it will cluster segments using hclust. Otherwise it will use the segmentation as provided. This function is called via the `fun.segmentation` argument of `runAbsoluteCN`. The arguments are passed via `args.segmentation`.

**Usage**

```r
segmentationHclust(
  seg,
  vcf = NULL,
  tumor.id.in.vcf = 1,
  normal.id.in.vcf = NULL,
  min.logr.sdev = 0.15,
  prune.hclust.h = NULL,
  prune.hclust.method = "ward.D",
  chr.hash = NULL,
  ...
)
```
Arguments

seg
If segmentation was provided by the user, this data structure will contain this segmentation. Useful for minimal segmentation functions. Otherwise PureCN will re-segment the data. This segmentation function ignores this user provided segmentation.

vcf
Optional CollapsedVCF object with germline allelic ratios.

tumor.id.in.vcf
Id of tumor in case multiple samples are stored in VCF.

normal.id.in.vcf
Id of normal in in VCF. Currently not used.

min.logr.sdev
Minimum log-ratio standard deviation used in the model. Useful to make fitting more robust to outliers in very clean data (currently not used in this segmentation function).

prune.hclust.h
Height in the hclust pruning step. Increasing this value will merge segments more aggressively. If NULL, try to find a sensible default.

prune.hclust.method
Cluster method used in the hclust pruning step. See documentation for the hclust function.

chr.hash
Mapping of non-numerical chromosome names to numerical names (e.g. chr1 to 1, chr2 to 2, etc.). If NULL, assume chromosomes are properly ordered.

... Currently unused arguments provided to other segmentation functions.

Value
data.frame containing the segmentation.

runAbsoluteCN

Examples

cvf.file <- system.file("extdata", "example.vcf.gz", package="PureCN")
interval.file <- system.file("extdata", "example_intervals_tiny.txt", package="PureCN")
seg.file <- system.file('extdata', 'example_seg.txt', package = 'PureCN')

res <- runAbsoluteCN(seg.file = seg.file,
  fun.segmentation = segmentationHclust,
  max.ploidy = 4, vcf.file = vcf.file,
  test.purity = seq(0.3, 0.7, by = 0.05),
  max.candidate.solutions = 1,
segmentationPSCBS

Description

Alternative segmentation function using the PSCBS package. This function is called via the fun.segmentation argument of runAbsoluteCN. The arguments are passed via args.segmentation.

Usage

segmentationPSCBS(
  normal,
  tumor,
  log.ratio,
  seg,
  plot.cnv,
  sampleid,
  weight.flag.pvalue = 0.01,
  alpha = 0.005,
  undo.SD = NULL,
  flavor = "tcn&dh",
  tauA = 0.03,
  vcf = NULL,
  tumor.id.in.vcf = 1,
  normal.id.in.vcf = NULL,
  max.segments = NULL,
  boost.on.target.max.size = 30,
  min.logr.sdev = 0.15,
  prune.hclust.h = NULL,
  prune.hclust.method = "ward.D",
  chr.hash = NULL,
  additional.cmd.args = "",
  centromeres = NULL,
  ...
)

Arguments

normal Coverage data for normal sample. Ignored in this function.
tumor Coverage data for tumor sample.
log.ratio Copy number log-ratios, one for each exon in coverage file.
If segmentation was provided by the user, this data structure will contain this segmentation. Useful for minimal segmentation functions. Otherwise PureCN will re-segment the data. This segmentation function ignores this user provided segmentation.

- **plot.cnv**: Segmentation plots.
- **sampleid**: Sample id, used in output files.
- **weight.flag.pvalue**: Flag values with one-sided p-value smaller than this cutoff.
- **alpha**: Alpha value for CBS, see documentation for the segment function.
- **undo.SD**: undo.SD for CBS, see documentation of the segment function. If NULL, try to find a sensible default.
- **flavor**: Flavor value for PSCBS. See `segmentByNonPairedPSCBS`.
- **tauA**: tauA argument for PSCBS. See `segmentByNonPairedPSCBS`.
- **vcf**: Optional VCF object with germline allelic ratios.
- **tumor.id.in.vcf**: Id of tumor in case multiple samples are stored in VCF.
- **normal.id.in.vcf**: Id of normal in in VCF. If NULL, use unpaired PSCBS.
- **max.segments**: If not NULL, try a higher undo.SD parameter if number of segments exceeds the threshold.
- **boost.on.target.max.size**: When off-target regions are noisy compared to on-target, try to find small segments of specified maximum size that might be missed to due the increased noise. Set to 0 to turn boosting off.
- **min.logr.sdev**: Minimum log-ratio standard deviation used in the model. Useful to make fitting more robust to outliers in very clean data.
- **prune.hclust.h**: Height in the hclust pruning step. Increasing this value will merge segments more aggressively. If NULL, try to find a sensible default.
- **prune.hclust.method**: Cluster method used in the hclust pruning step. See documentation for the hclust function.
- **chr.hash**: Mapping of non-numerical chromosome names to numerical names (e.g. chr1 to 1, chr2 to 2, etc.). If NULL, assume chromosomes are properly ordered.
- **additional.cmd.args**: character(1). Ignored.
- **centromeres**: A GRanges with centromere positions. If not NULL, add breakpoints at centromeres.
- **...**: Additional parameters passed to the `segmentByNonPairedPSCBS` function.

**Value**

data.frame containing the segmentation.

```

---

**setMappingBiasVcf**

*Set Mapping Bias VCF*

**Description**

Function to set mapping bias for each variant in the provided CollapsedVCF object. By default, it returns the same value for all variants, but a mapping bias file can be provided for position-specific mapping bias calculation.
setMappingBiasVcf

Usage

setMappingBiasVcf(
  vcf, tumor.id.in.vcf = NULL, mapping.bias.file = NULL, smooth = TRUE, smooth.n = 5
)

Arguments

vcf       CollapsedVCF object, read in with the readVcf function from the VariantAnnotation package.
tumor.id.in.vcf     Id of tumor in case multiple samples are stored in VCF.
mapping.bias.file     A precomputed mapping bias database obtained by calculateMappingBiasVcf. instead. reference and alt counts as AD genotype field. Should be compressed and
smooth     Impute mapping bias of variants not found in the panel by smoothing of neighboring SNPs. Requires mapping.bias.file.
smooth.n     Number of neighboring variants used for smoothing.

Value

Add elements to the vcf INFO field

bias     A numeric(nrow(vcf)) vector with the mapping bias of for each variant in the CollapsedVCF. Mapping bias is expected as scaling factor. Adjusted allelic fraction is (observed allelic fraction)/(mapping bias). Maximum scaling factor is 1 and means no bias.
pon.count     A numeric(nrow(vcf)) vector with the number of hits in the mapping.bias.file.
shape1, shape2     Fit of a beta distribution.

Author(s)

Markus Riester

Examples

# This function is typically only called by runAbsoluteCN via
# fun.setMappingBiasVcf and args.setMappingBiasVcf.
vcf.file <- system.file("extdata", "example.vcf.gz", package="PureCN")
vcf <- readVcf(vcf.file, "hg19")
vcf.bias <- setMappingBiasVcf(vcf)
setPriorVcf

**Description**

Function to set prior for somatic mutation status for each variant in the provided CollapsedVCF object.

**Usage**

```r
setPriorVcf(
  vcf,
  prior.somatic = c(0.5, 5e-04, 0.999, 1e-04, 0.995, 0.5),
  tumor.id.in.vcf = NULL,
  min.cosmic.cnt = 6,
  DB.info.flag = "DB",
  Cosmic.CNT.info.field = "Cosmic.CNT"
)
```

**Arguments**

- **vcf** CollapsedVCF object, read in with the `readVcf` function from the VariantAnnotation package.
- **prior.somatic** Prior probabilities for somatic mutations. First value is for the case when no matched normals are available and the variant is not in dbSNP (second value). Third value is for variants with MuTect somatic call. Different from 1, because somatic mutations in segments of copy number 0 have 0 probability and artifacts can thus have dramatic influence on likelihood score. Forth value is for variants not labeled as somatic by MuTect. Last two values are optional, if vcf contains a flag Cosmic.CNT, it will set the prior probability for variants with CNT > 2 to the first of those values in case of no matched normal available (0.995 default). Final value is for the case that variant is in both dbSNP and COSMIC > 2.
- **tumor.id.in.vcf** Id of tumor in case multiple samples are stored in VCF.
- **min.cosmic.cnt** Minimum number of hits in the COSMIC database to call variant as likely somatic.
- **DB.info.flag** Flag in INFO of VCF that marks presence in common germline databases. Defaults to `DB` that may contain somatic variants if it is from an unfiltered dbSNP VCF.
- **Cosmic.CNT.info.field** Info field containing hits in the Cosmic database

**Value**

The `vcf` with `numeric(nrow(vcf))` vector with the prior probability of somatic status for each variant in the CollapsedVCF added to the INFO field PR.
