git_last_commit fe2962b
**bioDist**

**Description**

Function to compute a bioDistclass object from profile data and a mapping. For details of the process see the user’s guide, but briefly the process involves using the mapping to identify reference features appropriate to each surrogate feature (if any), aggregating the surrogate data into pseudo-data for each reference feature, and then calculating the correlation distance between the reference features according to the surrogate data.
Usage

```r
bioDist(referenceFeatures=NULL, reference=NULL, mapping=NULL,
         referenceData=NULL, surrogateData=NULL, filtering=NULL,
         noMappingDist=NA, distance="spearman", aggregation="sum",
         maxitems=NULL, selectionRule="maxFC", expfac=NULL,
         name=NULL, ...)
```

Arguments

- **referenceFeatures**
  - subset of features to be considered for the computation of the distances. If `NULL` then the features are first gathered from the features in `referenceData`. If `referenceData` is not provided then the list of features are gathered from mapping (bioMap class) and using the reference.

- **reference**
  - A character indicating the variable that is being used as features to compute distance between

- **mapping**
  - The mapping between feature types

- **referenceData**
  - ExpressionSet object with the data from the reference features.

- **surrogateData**
  - ExpressionSet object with the data from the surrogate features.

- **filtering**
  - A filtering for the bioMap class. To be implemented.

- **noMappingDist**
  - Distance value to be used when a reference feature do not map to any surrogate feature. If "max", maximum indirect distance among the rest of reference features is taken. If NA, distance weights are re-scaled so this surrogate association is not considered. If a number then the missing values are replaces with that value.

- **distance**
  - Distance between features to be computed. Possible values are "pearson", "kendall", "spearman", "euclidean", "maximum", "manhattan", "canberra", "binary" and "minkowski". Default is "spearman".

- **aggregation**
  - Action to perform when a reference feature maps to more than one surrogate feature. Options are "max", "sum", "mean" or "median" and the the values are aggregated according to the chosen statistic.

- **maxitems**
  - The maximum number of surrogate features per reference feature to be used, selected according to "selectionRule" parameter. Default is 2.

- **selectionRule**
  - Rule to select the surrogate features to be used (the number is determined by "maxitems"). It can be one of the following: (1) "maxcor" those presenting maximum correlation with corresponding main feature; in this case "reference-Data" must be provided and the columns must overlap in at least 3 samples; (2) "maxmean": average across samples is computed and those features with higher mean are selected; case (3) is simmilar to (2) but considering other statistics: "maxmedian", "maxdiff", "maxFC", "sd", "ee".

- **expfac**
  - Not in use yet.

- **name**
  - Character that describes the nature of the bioDist class computed

- **...**
  - extra arguments passed to `dist`, eg "p=value" for the power used if calculating minkowski distance
Value

An object of class bioDistclass containing distances between the features in surrogateData.

                        weights = sample.weights)

######## Plot of distances.

bioDistWPlot(referenceFeatures = rownames(Block1),
              listDistW = bioDistWList,
              method.cor = "spearman")

######## Computing the matrix of features/distances associated.

fm <- bioDistFeature(Feature = rownames(Block1)[1],
                     listDistW = bioDistWList,
                     threshold.cor = 0.7)

bioDistFeaturePlot(data = fm)

---

**bioDistclass**

**Description**

Class to manage mappings between genomic features.

**Usage**

`bioDistclass(name, distance, map.name, map.metadata, params)`

**Arguments**

- `name`: Name assigned to the object
- `distance`: Matrix giving the distance between features
- `map.name`: Characterizing giving the name of the bioMap object used to compute the distance
- `map.metadata`: List of parameters used to generate the mapping
- `params`: List of parameters used to generate the distance
**bioDistFeature**

**Description**

Function that computes for a given selected feature the closest features given a selected set of weighted distances.

**Usage**

```r
bioDistFeature(Feature, listDistW, threshold.cor)
```

**Arguments**

- **Feature**: Feature A selected as a reference.
- **listDistW**: A list of bioDistWclass objects. All the objects must contain the Feature A selected and all of them must contain the same set of features.
- **threshold.cor**: A threshold to select the features associated to Feature A

**Value**

Matrix with the associated features given the different weighted distances considered

**Author(s)**

David Gomez-Cabrero

**Examples**

```r
data(STATegRa_S1)
data(STATegRa_S2)
require(Biobase)

# Truncate data for brevity
Block1 <- Block1[1:100,]
Block2 <- Block2[1:100,]

## Create ExpressionSets
mRNA.ds <- createOmicsExpressionSet(Data=Block1,pData=ed,pDataDescr=c("classname"))
miRNA.ds <- createOmicsExpressionSet(Data=Block2,pData=ed,pDataDescr=c("classname"))

    bioDistList = bioDistList,
    weights=sample.weights)

###### Plot of distances.
bioDistWPlot(referenceFeatures = rownames(Block1) ,
    listDistW = bioDistWList,
    method.cor="spearman")

###### Computing the matrix of features/distances associated.
fm<-bioDistFeature(Feature = rownames(Block1)[1] ,
    listDistW = bioDistWList,
    threshold.cor=0.7)
bioDistFeaturePlot(data=fm)
bioDistFeaturePlot

Description
Function that plots the results from a bioDistFeature analysis

Usage
bioDistFeaturePlot(data)

Arguments
data Matrix produced by bioDistFeature

Value
Generates a heatmap plot

Author(s)
David Gomez-Cabrero

Examples
data(STATegRa_S1)
data(STATegRa_S2)
require(Biobase)

# Truncate data for brevity

map.gene.miRNA<-bioMap(name = "Symbol-miRNA",
                        metadata = list(type_v1="Gene",type_v2="miRNA",
                                        source_database="targetscan.Hs.eg.db",
                                        data_extraction="July2014"),
                        map=mapdata)

# Create Gene-gene distance computed through miRNA data
bioDistmiRNA<-bioDist(referenceFeatures = rownames(Block1),
                        reference = "Var1",
                        mapping = map.gene.miRNA,
                        surrogateData = miRNA.ds, ### miRNA data
                        referenceData = mRNA.ds, ### mRNA data
                        maxitems=2,
                        selectionRule="sd",
                        expfac=NULL,
                        aggregation = "sum",
                        distance = "spearman",
                        noMappingDist = 0,
bioDistW

Provides weighted distances between a list of bioDistclass objects.

**Usage**

```r
bioDistW(referenceFeatures, bioDistList, weights)
```

**Example**

```r
bioDistmRNA <- new("bioDistclass",
  name = "mRNAbymiRNA",
  distance = cor(t(exprs(mRNA.ds)), method = "spearman"),
  map.name = "id",
  map.metadata = list(),
  params = list())
```

### Generation of the list of Surrogated distances.

```r
bioDistList <- list(bioDistmRNA, bioDistmiRNA)
```

### Generation of the list of bioDistWclass objects.

```r
bioDistWList <- bioDistW(referenceFeatures = rownames(Block1),
                         bioDistList = bioDistList,
                         weights = sample.weights)
```

### Plot of distances.

```r
bioDistWPlot(referenceFeatures = rownames(Block1),
              listDistW = bioDistWList,
              method.cor = "spearman")
```

### Computing the matrix of features/distances associated.

```r
fm <- bioDistFeature(Feature = rownames(Block1)[1],
                     listDistW = bioDistWList,
                     threshold.cor = 0.7)
```

```r
bioDistFeaturePlot(data = fm)
```
**Arguments**

- **referenceFeatures**
  The set of features that weighted distance is computed between.

- **bioDistList**
  A list of bioDistclass objects. All the objects must contain the set of features selected.

- **weights**
  A matrix where the number of columns equals the number of elements included in the bioDistList list.

**Value**

Returns a list of bioDistWclass objects. Each element in the list returns the weighted distance associated to each row in the “weights” matrix.

**Author(s)**

David Gomez-Cabrero

**Examples**

data(STAteRa_S1)
data(STAteRa_S2)
require(Biobase)

# Truncate data for brevity
Block1 <- Block1[1:100,]
Block2 <- Block2[1:100,]

## Create ExpressionSets
mRNA.ds <- createOmicsExpressionSet(Data=Block1,pData=ed,pDataDescr=c("classname"))
miRNA.ds <- createOmicsExpressionSet(Data=Block2,pData=ed,pDataDescr=c("classname"))

## Create the bioMap
map.gene.miRNA<-bioMap(name = "Symbol-miRNA",
metadata = list(type_v1="Gene",type_v2="miRNA",
source_database="targetscan.Hs.eg.db",
data_extraction="July2014"),
map=mapdata)

# Create Gene-gene distance computed through miRNA data
bioDistmiRNA<-bioDist(referenceFeatures = rownames(Block1),
reference = "Var1",
mapping = map.gene.miRNA,
surrogateData = miRNA.ds, ### miRNA data
referenceData = mRNA.ds, ### mRNA data
maxitems=2,
selectionRule="sd",
expfac=NULL,
aggregation = "sum",
distance = "spearman",
noMappingDist = 0, filtering = NULL,
name = "mRNAbymiRNA")

# Create Gene-gene distance through mRNA data
bioDistmRNA <- new("bioDistClass",
                   name = "mRNAbymiRNA",
                   distance = cor(t(exprs(mRNA.ds)), method="spearman"),
                   map.name = "id",
                   map.metadata = list(),
                   params = list())

###### Generation of the list of Surrogated distances.

bioDistList <- list(bioDistmRNA, bioDistmiRNA)
sample.weights <- matrix(0, 4, 2)
sample.weights[, 1] <- c(0, 0.33, 0.67, 1)
sample.weights[, 2] <- c(1, 0.67, 0.33, 0)

###### Generation of the list of bioDistWclass objects.

bioDistWList <- bioDistW(referenceFeatures = rownames(Block1),
                          bioDistList = bioDistList,
                          weights = sample.weights)

###### Plot of distances.

bioDistWPlot(referenceFeatures = rownames(Block1),
              listDistW = bioDistWList,
              method.cor = "spearman")

###### Computing the matrix of features/distances associated.

fm <- bioDistFeature(Feature = rownames(Block1)[1],
                     listDistW = bioDistWList,
                     threshold.cor = 0.7)

bioDistFeaturePlot(data = fm)

---

**bioDistWPlot**

**Usage**

bioDistWPlot(referenceFeatures, listDistW, method.cor)
Arguments

referenceFeatures
    The set of features to be used.
listDistW
    A list of bioDistW-class objects.
method.cor
    Method to compute distances between the elements in the listDistW. The default is spearman correlation.

Value

Makes a plot with the projected distance between the listDistW objects.

bioDistFeaturePlot(data=fm)

---

bioMap

**bioMap**

**Description**

Function to generate a bioMap object.

**Usage**

bioMap(name, metadata, map)

**Arguments**

name | Name to assign the object
metadata A list with information of the mapping. Elements expected in the list are: (1) "type_v1" and "type_v2", refer to the nature of the features mapped; a vocabulary we recommend is "gene", "mRNA", "miRNA", "proteins", etc. (2) "source_database", provides information on the source of the mapping; from a specific database e.g. "targetscan.Hs.eg.db" to a genomic location mapping. (3) "data_extraction" stores information on the data the mapping was generated or downloaded.

map A data.frame object storing the mapping. The data.frame may include an unlimited number of columns, however the first column must be named "Var1" and refer to the elements of "type_v1" and similarly for the second column ("Var2", "type_v2").

Value
An object of class bioMap

Author(s)
David Gomez-Cabrero

Examples
data(STATegRa_S2)
map.gene.miRNA<-bioMap(name = "Symbol-miRNA",
metadata = list(type_v1="Gene",type_v2="miRNA",
source_database="targetscan.Hs.eg.db",
data_extraction="July2014"),
map=mapdata)
**combiningMappings**

- **loadings**: List of matrices of common and distinctive loadings
- **VAF**: List of matrices indicating VAF (Variability Explained For) for each component in each block of data
- **others**: List containing other miscellaneous information specific to different SCA methods

**Author(s)**

Patricia Sebastian Leon

---

**combiningMappings**

*combiningMappings, combining several mappings for use in the omicsNPC function*

**Description**

This function combines several annotation so that measurements across different datasets are mapped to the same reference elements (e.g., genes). The annotations should all be either data frame / matrices, named vectors/lists, or bioMap objects. See the examples for further details

**Usage**

```r
combiningMappings(mappings, reference = NULL, retainAll = FALSE)
```

**Arguments**

- **mappings**: List of annotations.
- **reference**: If the annotations are data frame, matrices or bioMap objects, the name of the column containing the reference elements
- **retainAll**: Logical, if set to TRUE measurements that have no counterparts in other datasets are retained

**Value**

A data frame encoding the mapping across several dataset

**Author(s)**

Vincenzo Lagani

**References**

Examples

# Example 1
# Mapping with data frames
mRNA <- data.frame(gene = rep(c('G1', 'G2', 'G3'), each = 2), probeset = paste('p', 1:6, sep = ''));
methylation <- data.frame(gene = c(rep('G1', 3), rep('G2', 4)),
                         methy = paste('methy', 1:7, sep = ''));
mRNA <- data.frame(gene = rep(c('G1', 'G2', 'G3'), each = 2), probeset = paste('p', 1:6, sep = ''));
mRNA <- rep(c('G1', 'G2', 'G3'), each = 2);
names(mRNA) = paste('p', 1:6, sep = '');
methylation <- c(rep('G1', 3), rep('G2', 4));
names(methylation) = paste('methy', 1:7, sep = '');
mRNA <- c(rep('G1', 2), rep('G2', 1), rep('G3', 2));
names(miRNA) = c('miR1', 'miR2', 'miR1', 'miR1', 'miR2');
mappings <- list(mRNA = mRNA, methylation = methylation, miRNA = miRNA);

# Example 2
# Mapping with character vectors
mRNA <- rep(c('G1', 'G2', 'G3'), each = 2);
names(mRNA) = paste('p', 1:6, sep = '');
methylation <- c(rep('G1', 3), rep('G2', 4));
names(methylation) = paste('methy', 1:7, sep = '');
mRNA <- c(rep('G1', 2), rep('G2', 1), rep('G3', 2));
names(miRNA) = c('miR1', 'miR2', 'miR1', 'miR1', 'miR2');
mappings <- list(mRNA = mRNA, methylation = methylation, miRNA = miRNA);

createOmicsExpressionSet

Description

This function allows the user to create a ExpressionSet object from a matrix representing an omics dataset. It allows to include the experimental design and annotation in the ExpressionSet object.

Usage

createOmicsExpressionSet(Data, pData = NULL, pDataDescr = NULL,
                           feaData = NULL, feaDataDescr = NULL)

Arguments

- Data: Omics data
- pData: Data associated with the samples/phenotype
- pDataDescr: Description of the phenotypic data
- feaData: Data associated with the variables/features annotation
- feaDataDescr: Description of the feature annotation

Details

In Data matrix, samples has to be in columns and variables has to be in rows.
getInitialData

Value

ExpressionSet with the data provided

Author(s)

Patricia Sebastian-Leon

Examples

data(STATegRa_S3)
B1 <- createOmicsExpressionSet(Data=Block1.PCA,pData=ed.PCA,
pDataDescr=c("classname"))
B2 <- createOmicsExpressionSet(Data=Block2.PCA,pData=ed.PCA,
pDataDescr=c("classname"))

getInitialData Retrieve initial data from caClass objects

Description

Generic function to retrieve the initial data used for by omicsCompAnalysis from a caClass-class object

Usage

genericInitialData(x, block=NULL)

Arguments

x caClass-class object.

block Character indicating the block of data to be returned. It can be specified by the position of the block ("1" or "2") or the name assigned in the caClass-class object. If it is NULL both blocks are displayed.

Value

The requested data block or blocks

getLoadings

Retrieve component analysis loadings

Description

Generic function to retrieve loadings (common and distinctive) found by `omicsCompAnalysis` on a `caClass-class` object.

Usage

```r
getLoadings(x, part=NULL, block=NULL)
```

Arguments

- **x**: `caClass-class` object.
- **part**: Character indicating whether "common" or "distinctive" loadings should be displayed.
- **block**: Character indicating the block of data for which the loadings will be given. It can be specified by the position of the block ("1" or "2") or the name assigned in the `caClass-class` object. If it is NULL both blocks are displayed.

Value

A list containing the requested information.

Author(s)

Patricia Sebastian-Leon

Examples

data("STATegRa_S3")
B1 <- createOmicsExpressionSet(Data=Block1.PCA, pData=ed.PCA,
pDataDescr=c("classname"))
B2 <- createOmicsExpressionSet(Data=Block2.PCA,
pData=ed.PCA, pDataDescr=c("classname"))
# Omics components analysis
res <- omicsCompAnalysis(Input=list(B1, B2), Names=c("expr", "mirna"),
method="DISCOSCA", Rcommon=2, Rspecific=c(2, 2),
center=TRUE, scale=TRUE, weight=TRUE)
getLoadings(res)
getLoadings(res, part="common", block="expr")
getLoadings(res, part="distinctive", block="expr")

getMethodInfo

Retrieve information about component analysis method

Description

Generic function to retrieve information about the method used by omicsCompAnalysis on a caClass-class object.

Usage

ggetMethodInfo(x, method=FALSE, comps=NULL, block=NULL)

Arguments

x caClass-class object.
method Logical indicating whether to return the method name.
comps Character indicating which component number to return ("common", "distinctive" or "all")
block Character indicating the block of data for which the component count will be given. It can be specified by the position of the block ("1" or "2") or the name assigned in the caClass-class object. If it is NULL both blocks are displayed.

Value

A list containing the requested information.

Examples

data(“STATegRa_S3”)  
B1 <- createOmicsExpressionSet(Data=Block1.PCA, pData=ed.PCA,  
    pDataDescr=c(“classname”))  
B2 <- createOmicsExpressionSet(Data=Block2.PCA,  
    pData=ed.PCA, pDataDescr=c(“classname”))  
# Omics components analysis  
res <- omicsCompAnalysis(Input=list(B1, B2), Names=c(“expr”, “mirna”),  
    method=“DISCOSCA”, Rcommon=2, Rspecific=c(2, 2),  
    center=TRUE, scale=TRUE, weight=TRUE)  
getMethodInfo(res)  
getMethodInfo(res, method=TRUE)  
getMethodInfo(res, comps=“all”, block=“expr”)  

getPreprocessing

Retrieve information about preprocessing

Description

Generic function to retrieve information about the preprocessing done by omicsCompAnalysis on a caClass-class object.

Usage

getPreprocessing(x, process=FALSE, preproData=FALSE, block=NULL)

Arguments

x caClass-class object.
process Logical indicating whether to return information about the processing done.
preproData Logical indicating whether to return the pre-processed data matrices.
block Character indicating the block of data to be returned. It can be specified by the position of the block (“1” or “2”) or the name assigned in the caClass-class object. If it is NULL both blocks are displayed.

Value

If both process and preproData are specified, a list containing (otherwise the individual item):

process Character indicating the processing done
preproData Matrix (or list of matrices, depending on block) containing pre-processed data

Author(s)

Patricia Sebastian-Leon
getScores

# Omics components analysis
res <- omicsCompAnalysis(Input=list(B1, B2), Names=c("expr", "mirna"),
  method="DISCOSCA", Rcommon=2, Rspecific=c(2, 2),
  center=TRUE, scale=TRUE, weight=TRUE)
getPreprocessing(res, process=TRUE)
getPreprocessing(res, preproData=TRUE, block="1")

getScores
Retrieve component analysis scores

Description
Generic function to retrieve scores (common and distinctive) found by omicsCompAnalysis on a caClass-class object.

Usage
getScores(x, part=NULL, block=NULL)

Arguments

x  caClass-class object.
part Character indicating whether "common" or "distinctive" scores should be displayed
block Character indicating the block of data for which the scores will be given. It can be specified by the position of the block ("1" or "2") or the name assigned in the caClass-class object. If it is NULL both blocks are displayed.

Value
A list containing the requested information.

Author(s)
Patricia Sebastian-Leon
getVAF

Retrieve information about VAF

Description

Generic function to retrieve VAF found by omicsCompAnalysis on a caClass-class object.

Usage

getVAF(x, part=NULL, block=NULL)

Arguments

x caClass-class object.

part Character indicating whether "common" or "distinctive" VAF should be displayed

block Character indicating the block of data for which the VAF will be given. It can be specified by the position of the block ("1" or "2") or the name assigned in the caClass-class object. If it is NULL both blocks are displayed.

Value

A list containing the requested information.

holistOmics

HolistOmics an application of NPC on omics datasets

Description
This function is defunct. Use omicsNPC instead.

Usage
holistOmics(dataInput, dataTypes, comb.method = c("Fisher", "Liptak", "Tippett"),
numPerm = 1000, numCores = 1, verbose = FALSE)

Arguments

dataInput List of ExpressionSet objects, one for each data modality.
dataTypes Character vector with possible values: 'RNA-seq', 'microarray'
comb.method Character vector with possible values: 'Fisher', 'Liptak', 'Tippett', if more than
one is specified, all will be used.
umPerm Number of permutations
numCores Number of CPU cores to use
verbose Logical, if set to TRUE holistOmics prints out the step that it performs

Value
A data.frame

Author(s)
Nestoras Karathanasis

References

Examples

# Load the data
data("TCGA_BRCA_Batch_93")
# Setting dataTypes, the first two ExpressionSets include RNAseq data,
# the third ExpressionSet includes Microarray data.
dataTypes <- c("RNAseq", "RNAseq", "Microarray")
# Setting methods to combine pvalues
comb.method = c("Fisher", "Liptak", "Tippett")
# Setting number of permutations
numPerm = 1000
# Setting number of cores
numCores = 1
# Setting holistOmics to print out the steps that it performs.
verbose = TRUE
# Run holistOmics analysis.
# The output is a data.frame of p-values.
# Each row corresponds to a gene name. Each column corresponds to a method
# used in the analysis.
## Not run: out <- holistOmics(dataInput = TCGA_BRCA_Data, dataTypes = dataTypes,
# comb.method = comb.method, numPerm = numPerm,
# numCores = numCores, verbose = verbose)
## End(Not run)

modelSelection Find optimal common and distinctive components

Description

Estimate the optimal number of common and distinctive components according to given selection criteria.

Usage

modelSelection(Input,Rmax,fac.sel,varthreshold=NULL,nvar=NULL,PCnum=NULL,center=FALSE, scale=FALSE,weight=FALSE,plot_common=FALSE,plot_dist=FALSE)

Arguments

Input List of ExpressionSet objects, one for each block of data
Rmax Maximum common components
fac.sel PCA criteria for selection ("%accum", "single%", "rel.abs", "fixed.num")
varthreshold Cumulative variance criteria for PCA selection. Threshold for "%accum" or "single%" criteria.
nvar Relative variance criteria. Threshold for "rel.abs".
PCnum Fixed number of components for "fixed.num".
center Character (or FALSE) specifying which (if any) centering will be applied before analysis. Choices are "PERBLOCKS" (each block separately) or "ALL-BLOCKS" (all data together).
**modelSelection**

- **scale**  Character (or FALSE) specifying which (if any) scaling will be applied before analysis. Choices are "PERBLOCKS" (each block separately) or "ALL-BLOCKS" (all data together).

- **weight**  Logical indicating whether weighting is to be done. Choices are "BETWEEN-BLOCKS"

- **plot_common**  Logical indicating whether to plot the explained variances (SSQ) of each block and its estimation and the ratios

- **plot_dist**  Logical indicating whether to plot the explained variances (SSQ) and the accumulated variance for each block

**Value**

List containing:

- **common**  List with common components results
- **commonComps**  Optimal number of common components
- **ssqs**  Matrix of SSQ for each block and estimator
- **pssq**  `ggplot` object showing SSQ for each block and estimator
- **pratios**  `ggplot` object showing SSQ ratios between each block and estimator
- **dist**  List containing the results of distinct PCA for each input block; for each block PCAres and numComps is returned within a list
- **PCAres**  List containing results of PCA, with fields "eigen", "var.exp", "scores" and "loadings"
- **nomComps**  Number of components selected

**Author(s)**

Patricia Sebastian-Leon

**See Also**

- `omicsCompAnalysis`

**Examples**

data(STATegRa_S3)
B1 <- createOmicsExpressionSet(Data=Block1.PCA,pData=ed.PCA,pDataDescr=c("classname"))
B2 <- createOmicsExpressionSet(Data=Block2.PCA,pData=ed.PCA,pDataDescr=c("classname"))
ms <- modelSelection(Input=list(B1, B2), Rmax=3, fac.sel="single\%", varthreshold=0.03, center=TRUE, scale=FALSE, ms
omicsCompAnalysis  Components analysis for multiple objects

Description

This function performs a components analysis of object wise omics data to understand the mechanisms that underlay all the data blocks under study (common mechanisms) and the mechanisms underlying each of the data block independently (distinctive mechanisms). This analysis include both, the preprocessing of data and the components analysis by using three different methodologies.

Usage

omicsCompAnalysis(Input, Names, method, Rcommon, Rspecific,
    convThres=1e-10, maxIter=600, center=FALSE,
    scale=FALSE, weight=FALSE)

Arguments

- **Input**  List of ExpressionSet objects, one for each block of data.
- **Names**  Character vector giving names for each Input object.
- **method** Method to use for analysis (either "DISCOSCA", "JIVE", or "O2PLS").
- **Rcommon**  Number of common components between all blocks
- **Rspecific**  Vector giving number of unique components for each input block
- **convThres**  Stop criteria for convergence
- **maxIter**  Maximum number of iterations
- **center**  Character (or FALSE) specifying which (if any) centering will be applied before analysis. Choices are "PERBLOCKS" (each block separately) or "ALL-BLOCKS" (all data together).
- **scale**  Character (or FALSE) specifying which (if any) scaling will be applied before analysis. Choices are "PERBLOCKS" (each block separately) or "ALL-BLOCKS" (all data together).
- **weight** Logical indicating whether weighting is to be done.

Value

An object of class `caClass-class`.

Author(s)

Patricia Sebastian Leon
Examples

data("STATegRa_S3")
B1 <- createOmicsExpressionSet(Data=Block1.PCA,pData=ed.PCA,
pDataDescr=c("classname"))
B2 <- createOmicsExpressionSet(Data=Block2.PCA,
pData=ed.PCA,pDataDescr=c("classname"))

# Omics components analysis
discoRes <- omicsCompAnalysis(Input=list(B1,B2),Names=c("expr","mirna"),
method="DISCOSCA",Rcommon=2,Rspecific=c(2,2),
center=TRUE,scale=TRUE,weight=TRUE)
jiveRes <- omicsCompAnalysis(Input=list(B1,B2),Names=c("expr","mirna"),
method="JIVE",Rcommon=2,Rspecific=c(2,2),
center=TRUE,scale=TRUE,weight=TRUE)
o2plsRes <- omicsCompAnalysis(Input=list(B1,B2),Names=c("expr","mirna"),
method="O2PLS",Rcommon=2,Rspecific=c(2,2),
center=TRUE,scale=TRUE,weight=TRUE)

Description

This function applies the NonParametric Combination methodology on the integrative analysis of different omics data modalities. It retrieves genes associated to a given outcome, taking into account all omics data. First, each datatype is analyzed independently using the appropriate method. omicsNPC analyses continuous data (microarray) using limma, while count data (e.g., RNAseq) are first preprocessed with using the "voom" function. The user can also specify their own function for computing deregulation / association The p-values from the single dataset analysis are then combined employing Fisher, Liptak and Tippett combining functions. The Tippett function returns findings which are supported by at least one omics modality. The Liptak function returns findings which are supported by most modalities. The Fisher function has an intermediate behavior between those of Tippett and Liptak.

Usage

omicsNPC(dataInput, dataMapping, dataTypes = rep('continuous', length(dataInput)),
combMethods = c("Fisher", "Liptak", "Tippett"), numPerms = 1000,
numCores = 1, verbose = FALSE, functionGeneratingIndex = NULL,
outcomeName = NULL, allCombinations = FALSE,
dataWeights = rep(1, length(dataInput))/length(dataInput),
returnPermPvalues = FALSE, ...)

Arguments

dataInput List of ExpressionSet objects, one for each data modality.
dataMapping A data frame describing how to map measurements across datasets. See details for more information.
dataTypes Character vector with possible values: 'continuous', 'count'. Alternatively, a list of functions for assessing deregulation / association with an outcome.

combMethods Character vector with possible values: 'Fisher', 'Liptak', 'Tippett'. If more than one is specified, all will be used.

numPerms Number of permutations

numCores Number of CPU cores to use

verbose Logical, if set to TRUE omicsNPC prints out the step that it performs

functionGeneratingIndex Function generating the indices for randomly permuting the samples

outcomeName Name of the outcome of interest / experimental factor, as reported in the design matrices. If NULL, the last column of the design matrices is assumed to be the outcome of interest.

allCombinations Logical, if TRUE all combinations of omics datasets are considered

dataWeights A vector specifying the weight to give to each dataset. Note that sum(dataWeights) should be 1.

returnPermPvalues Logical, should the p-values computed at each permutation being returned?

... Additional arguments to be passed to the user-defined functions

Value

A list containing: stats0 Partial deregulation / association statistics pvalues0 The partial p-values computed on each dataset pvaluesNPC The p-values computed through NPC. permPvalues The p-values computed at each permutation

Author(s)

---

plotRes ** Plot component analysis results**

**Description**
Plot scatterplots of scores or loadings, for common and distinctive parts as well as combined plots.

**Usage**

```r
plotRes(object, comps=c(1, 2), what, type, combined, block=NULL, 
color=NULL, shape=NULL, labels=NULL, title=NULL, xlabel=NULL, ylabel=NULL, background=TRUE, 
palette=NULL, pointSize=4, labelSize=NULL, 
axisSize=NULL, titleSize=NULL, sizeValues = c(2,4), shapeValues = c(17, 0))
```

**Arguments**

- **object** caClass-class containing component analysis results
- **comps** If combined=FALSE, it indicates the x and y components of the type and block chosen. If combined=TRUE, it indicates the component to plot for the first block of information and the component for the second block of information to plot together. By default the components are set to c(1,2) if combined=FALSE and to c(1,1) if combined=TRUE.
- **what** Either "scores", "loadings" or "both"
- **type** Either "common", "individual" or "both"
- **combined** Logical indicating whether to make a simple plot of two components from one block, or components from different blocks
- **block** Which block to plot, either "1" or "2" or the name of the block.
- **color** Character specifying a pData column from the original data to use to color points
- **shape** Character specifying a pData column to select point shape
- **labels** Character specifying a pData column from which to take point labels
- **title** Main title
- **xlabel** x-axis name
plotRes

ylabel  y-axis name
background Logical specifying whether to make a grey background
palette  Vector giving the color palette for the plot
pointSize  Size of plot points
labelSize  Size of point labels if not NULL
axisSize  Size of axis text
titleSize  Size of title text
sizeValues  Vector containing sizes for scores and loadings
shapeValues  Vector indicating the shapes for scores and loadings

Value

ggplot object

Author(s)

labelSize=NULL,axisSize=NULL,titleSize=NULL)

---

plotVAF

## plotVAF

**Plot VAF (Variance Explained For) from Component Analysis**

### Description

This function visualises the VAF results from component analysis. The input is a `caClass-class` object from `omicsCompAnalysis`. VAF cannot be calculated if mode "O2PLS" was used. The plots for modes "DISCOSCA" and "JIVE" are different since DISCO-SCA distinctive components have some VAF in the other block. This VAF can be interpreted as an error in the rotation.

### Usage

```r
plotVAF(object, mainTitle="")
```
Arguments

- `object caClass-class` object containing component analysis results
- `mainTitle` Plot title

Value

- ggplot object

Author(s)

Patricia Sebastian-Leon

Examples

```r
data("STATegRa_S3")
require(ggplot2)
B1 <- createOmicsExpressionSet(Data=Block1.PCA,pData=ed.PCA,
pDataDescr=c("classname"))
B2 <- createOmicsExpressionSet(Data=Block2.PCA,
pData=ed.PCA,pDataDescr=c("classname"))
# Omics components analysis
discoRes <- omicsCompAnalysis(Input=list(B1,B2),Names=c("expr","mirna"),
 method="DISCOSCA",Rcommon=2,Rspecific=c(2,2),
 center=TRUE,scale=TRUE,weight=TRUE)
jiveRes <- omicsCompAnalysis(Input=list(B1,B2),Names=c("expr","mirna"),
 method="JIVE",Rcommon=2,Rspecific=c(2,2),
 center=TRUE,scale=TRUE,weight=TRUE)

# DISCO-SCA plotVAF
plotVAF(discoRes)

# JIVE plotVAF
plotVAF(jiveRes)
```

<th>STATegRa_data_TCGA_BRCA</th>
<th>STATegRa data</th>
</tr>
</thead>
</table>

**Description**

mRNA data (Block1), miRNA data (Block2) and the design matrix (ed), from STATegRa_S1, provides selected data downloaded from [https://tcga-data.nci.nih.gov/docs/publications/gbm_exp/](https://tcga-data.nci.nih.gov/docs/publications/gbm_exp/). The mapping between miRNA and mRNA (mapdata, available in STATegRa_S2) contains, as a processed matrix, selected information available from TargetScan; we selected the set of miRNA target predictions for humans for those miRNA-mRNA pairs where both miRNA and mRNA were in Block1 and Block2 respectively.

The PCA version of the data (Block1.PCA, Block2.PCA, ed.PCA; available in STATegRa_S3), provides a similar data-set to Block1, Block2 and ed data; however in this case the data has been processed in order to provide a pedagogic example of OmicsPCA. Results obtained from OmicsPCA (omicsCompAnalysis) with the existing data should not be taken as clinically valid.

**Format**

Two matrices with mRNA and miRNA expression data, a design matrix that describes both and a mapping between miRNA and genes.

**Author(s)**

David Gomez-Cabrero, Patricia Sebastian-Leon, Gordon Ball

**Source**

(a) See [https://tcga-data.nci.nih.gov/docs/publications/gbm_exp/](https://tcga-data.nci.nih.gov/docs/publications/gbm_exp/). (b) Gabor Csardi, targetscan.Hs.eg.db: TargetScan miRNA target predictions for human. R package version 0.6.1

**Examples**

```r
data(STATegRa_S1)
data(STATegRa_S2)
data(STATegRa_S3)
```

**Description**

Data were downloaded from TCGA data portal, [https://tcga-data.nci.nih.gov/tcga/](https://tcga-data.nci.nih.gov/tcga/). We downloaded sixteen tumour samples and the sixteen matching normal, for Breast invasive carcinoma, BRCA, batch 93. Herein, three types of data modalities are included, RNAseq (TCGA_BRCA_Data$RNAseq), RNAseqV2 (TCGA_BRCA_Data$RNAseqV2) and Expression-Genes (TCGA_BRCA_Data$Microarray). The Data Level was set to Level 3. For each data type, we pooled all data to one matrix, where rows corresponded to genes and columns to samples. Only the first 100 genes are included.
Format

One list, which contains three ExpressionSet objects.
