Package ‘SUITOR’

May 4, 2024

Title Selecting the number of mutational signatures through cross-validation

Version 1.6.0

Date 2022-05-10

Description An unsupervised cross-validation method to select the optimal number of mutational signatures. A data set of mutational counts is split into training and validation data. Signatures are estimated in the training data and then used to predict the mutations in the validation data.

Imports stats, utils, graphics, ggplot2, BiocParallel

Depends R (>= 4.2.0)

License GPL-2

SUITOR-package  Number of mutational signatures

Description

To select the number of mutational signatures through cross-validation.

Details

SUITOR (Selecting the number of mutational signatures through cross-validation), an unsupervised cross-validation method that requires little assumptions and no numerical approximations to select the optimal number of signatures without overfitting the data. The full dataset of mutation counts is split into a training set and a validation set; for a given number of signatures, these signatures are estimated in the training set and then they are used to predict the mutations in the validation set. Multiple candidate numbers of signatures are considered; and the number of signatures which predicts most closely the mutations in the validation set is selected.

The two main functions in this package are suitor and suitorExtractWH.

References

**getSummary**

*Compute summary results*

**Description**

Compute summary results and the optimal rank from the matrix containing all results.

**Usage**

```r
getSummary(obj, NC, NR=96)
```

**Arguments**

- `obj` Matrix containing all results in the return list from `suitor`.
- `NC` The number of columns in `data` when `suitor` was called.
- `NR` The number of rows in `data` when `suitor` was called. The default is 96.

**Details**

The input matrix `obj` must have column 1 as the rank, column 2 as the value of k in `1:k.fold`, column 4 as the training errors, and column 5 as the testing errors.

**Value**

A list containing the objects:

- `rank`: The optimal rank
- `all.results`: Matrix containing training and testing errors for all values of seeds, ranks, folds. NA values appear for runs in which the EM algorithm did not converge.
- `summary`: Data frame of summarized results for each possible rank created from `all.results`. The `MSErr` column is defined as `sqrt((fold1 + ... +foldK)/(nrow(data)*ncol(data)))`

**See Also**

- `plotErrors`

**Examples**

```r
data(SimData, package="SUITOR")
data(results, package="SUITOR")
ret <- getSummary(results$all.results, ncol(SimData))
ret$summary
ret$rank
```
plotData

Example data for plotting

Description

A data frame with columns Rank, Type, and MSErr

See Also

suitor

Examples

```r
data(plotData, package="SUITOR")
plotData
```

plotErrors

Plot train and test errors

Description

Plot train and test errors

Usage

```r
plotErrors(x)
```

Arguments

- `x` Data frame of summary results in the return list from suitor or from getSummary, or a data frame with columns Rank, Type, and MSErr.

Details

The optimal rank is the minimum at which the test error is attained, and appears as a red dot on the graph.

Value

NULL

-suitor

Examples

```r
data(results, package="SUITOR")

results
```

SimData

Data for examples

Description

Example input data and results

Details

Contains an example input data object of size 96 by 300. It is generated by rpois with mean WH where W (96 by 8) is profile of 8 signatures (SBS 4, 6, 7a, 9, 17b, 22, 26, 39) obtained from https://cancer.sanger.ac.uk/cosmic/signatures/SBS and H (8 by 300) is rounded integer generated from a uniform distribution between 0 and 100 with some randomly selected cells being set to zero.

-suitor

Examples

```r
data(SimData, package="SUITOR")

# Display a subset of data objects
SimData[1:5, 1:5]
```
Description

Selecting the number of mutational signatures through cross-validation

Usage

suitor(data, op=NULL)

Arguments

data Data frame or matrix containing mutational signatures. This object must contain non-negative values

op List of options (see details). The default is NULL.

Details

The algorithm finds the optimal rank by applying k-fold cross validation.

Options list op:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>em.eps</td>
<td>EM algorithm stopping tolerance</td>
<td>1e-5</td>

<td>0 or 1 to print info</td>
<td>1</td>
</tr>
<tr>
<td>kfold.vec</td>
<td>Vector of values in 1:k.fold when running on a cluster</td>
<td>NULL</td>
</tr>
</tbody>
</table>

Parallel computing

The BiocParallel package is used for parallel computing. If BPPARAM = NULL, then BPPARAM will be set to SerialParam.

Utilizing a cluster

When running on a cluster, the option get.summary should be set to 0. For fastest running jobs, set the options min.rank = max.rank, kfold.vec to a single integer in 1:k.fold, and n.starts to 1.
suitorExtractWH

Value

A list containing the objects:

- rank: The optimal rank
- all.results: Matrix containing training and testing errors for all values of seeds, ranks, folds.
- summary: Data frame of summarized results for each possible rank created from all.results. The MSErr column is defined as \( \text{sqrt}((\text{fold1} + \cdots + \text{foldK})/\text{nrow(data)}*\text{ncol(data)}) \)

See Also

getSummary, plotErrors

Examples

data(SimData, package="SUITOR")

# Using the default options will take several minutes to run
ret <- suitor(SimData)

suitorExtractWH

Description

Extract the matrix of activities (exposures) and matrix of signatures

Usage

suitorExtractWH(data, rank, op=NULL)

Arguments

- data: Data frame or matrix containing mutational signatures. This object must contain non-negative values
- rank: Integer > 0
- op: List of options (see details). The default is NULL.

Details

Options list op:
**Parallel computing**

The BiocParallel package is used for parallel computing. If `BPPARAM = NULL`, then `BPPARAM` will be set to `SerialParam`.

**Value**

A list containing the objects:

- \( H \): Matrix of activities (exposures)
- \( W \): Matrix of signatures
