Package ‘XDE’

May 30, 2024

Title  XDE: a Bayesian hierarchical model for cross-study analysis of differential gene expression

Version  2.50.0

Date  2020-09-01

Author  R.B. Scharpf, G. Parmigiani, A.B. Nobel, and H. Tjelmeland

Description  Multi-level model for cross-study detection of differential gene expression.

Depends  R (>= 2.10.0), Biobase (>= 2.5.5)

Imports  BiocGenerics, genefilter, graphics, grDevices, gtools, methods, stats, utils, mvtnorm, RColorBrewer, GeneMeta, siggenes

Suggests  MASS, RUnit

Maintainer  Robert Scharpf <rscharpf@jhsph.edu>

Enhances  coda

License  LGPL-2

LazyLoad  yes

biocViews  Microarray, DifferentialExpression

RoxygenNote  7.1.1

burnin  

Indicator for running a MCMC burnin

Description

When TRUE, log files from MCMC chains are not written to file. When FALSE, log files are written for every parameter by default.

Usage

burnin(object)

Arguments

object  An object of class XdeParameter
calculatePosteriorAvg

Value
logical

Author(s)
R. Scharpf

See Also
XdeParameter-class

Examples

## Not run:
data(expressionSetList)
params <- new("XdeParameter", phenotypeLabel="adenoVsquamous",
esetList=expressionSetList)

## the replacement method for burnin is called for its side effect of
## providing default values of storing MCMC chains
output(params)[2:22]
burnin(params) <- FALSE
output(params)[2:22]
burnin(params) <- TRUE
output(params)[2:22]

## End(Not run)

---

**calculatePosteriorAvg**  
*Calculate the posterior average for indicators of concordant and discordant differential expression*

**Description**

This function calculates the posterior average for indicators of concordant and discordant differential expression from the saved log files. See details.

**Usage**

calculatePosteriorAvg(object, NCONC=2, NDIFF=1, burnin=0)

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Object of class XdeMcmc</td>
</tr>
<tr>
<td>NCONC</td>
<td>Integer: number of studies for which the gene must be differentially expressed (in the same direction) to be classified as concordant differential expression</td>
</tr>
</tbody>
</table>
empiricalStart

NDIFF
Integer: number of studies for which a gene must be up- or down-regulated to be classified as differentially expressed. It is the union of concordant and discordant differential expression.

burnin
Integer: number of MCMC iterations for the burnin. Posterior means are computed from the MCMC samples following burnin.

Details
For each iteration,
1. calculate the sign of delta * Delta
2. For each gene, compute the number of positive signs (P) and the number of negative signs (N) (a G x 2 matrix, where G is the number of genes in common across all studies). P + N is <= S, where S is the number of studies.
3. for a given gene, the discordant indicator is simply when P * N is nonzero.
4. The concordant indicator requires P * N = 0 AND P + N >= NCONC, where NCONC is specified by the user.
5. differential expression is simply | P | + | N | >= NDIFF. By default, NDIFF is 1 but can be user-specified.
   The posterior average is then computed from the mean over all MCMC iterations.

Value
A G x 3 matrix.

Author(s)
RS

See Also
posteriorAvg

empiricalStart
Empirical starting values for the MCMC

Description
Empirical starting values for the MCMC are based on data in objects of class ExpressionSetList

Usage
dependentStart(object, zeroNu = FALSE, phenotypeLabel, one.delta=FALSE, T_THRESH=4)
empiricalStart

Arguments

object  An object of class ExpressionSetList
zeroNu  Logical: if TRUE, the nu in the Bayesian model are not modeled – set to zero and not updated in the MCMC. Setting zeroNu to TRUE should be regarded as experimental
phenotypeLabel  character: binary phenotype. phenotypeLabel must be in the varLabels of each ExpressionSet object
one.delta  delta in the Bayesian model is a gene-specific indicator for differential expression. If one.delta is FALSE, we assume that a gene can be differentially expressed in a subset of studies. When TRUE, we assume that a gene is differentially expressed in all studies or in none.
T_THRESH  A threshold of t-statistics (calculated row-wise for each study) for determining starting values of the differential expression indicator, delta.

Value

A list containing starting values for the MCMC that are derived from empirical estimates of the data.

Author(s)

R. Scharpf

See Also

zeroNu, XdeParameter-class, ExpressionSetList-class

Examples

library(XDE)
data(expressionSetList)
eList <- studyCenter(expressionSetList)
empirical <- empiricalStart(eList, phenotypeLabel="adenoVsquamous", T_THRESH=3)  
##By default, initial values for the MCMC are sampled from the prior
##when initializing an object of class XdeParameter
params <- new("XdeParameter", esetList=eList, phenotypeLabel="adenoVsquamous", one.delta=FALSE, burnin=TRUE)
##The initial values can be replaced by empirical values as follows:
firstMcmc(params) <- empirical
expressionSetList

Example of ExpressionSetList

Description

Object of class ExpressionSetList containing three studies. Each element in the list is an ExpressionSet.

Usage

data(expressionSetList)

Details

Parmigiani et al. (2004) performed a cross-study analysis of three lung cancer studies. The studies used in this analysis were merged by UniGene identifiers to obtain a set of 3,171 gene. The R experiment data package lungExpression that was developed to facilitate the reproducibility of this analysis contains the three studies as ExpressionSets. Here, we take a random sample of 500 features from one study (the "stanford" study), and split this study into three artificial studies that each contain 4 squamous carcinomas and 3 adenocarcinomas. The three artificial studies are then used to create an instance of the ExpressionSetList class.

See Garber et al. (2001) for the raw data and description of the "stanford" study.

Source

The experiment data package lungExpression (www.bioconductor.org)

References

Examples

data(expressionSetList)
ExpressionSetList-class

A class for containing a list of ExpressionSets

Description

Each element in the list must be a valid ExpressionSet. The featureNames must be identical for each ExpressionSet.

Objects from the Class

Objects can be created by calls of the form new("ExpressionSetList", ...).

Slots

.Data: Object of class "list"

Extends

Class "list", from data part. Class "vector", by class "list", distance 2. Class class-AssayData, by class "list", distance 2.

Methods

"[" signature(x = "ExpressionSetList") Subsets each ExpressionSet element in the list.

coerce signature(from = "list", to = "ExpressionSetList") Coerces a list of ExpressionSet objects to an object of class ExpressionSetList. The validityMethod for the ExpressionSetList class will return an error if the featureNames for each ExpressionSet are not identical.

dim signature(x="ExpressionSetList") applies dim to each element of the list.

featureNames signature(object = "ExpressionSetList") Accessor for the featureNames

geneCenter signature(object = "ExpressionSetList") See geneCenter

lapply signature(object="ExpressionSetList") Coerces instance of ExpressionSetList to a list and does lapply on the list. Returns an object of class ExpressionSetList

nSamples signature(x = "ExpressionSetList") Numerical vector giving the number of samples in each ExpressionSet

nrow signature(x = "ExpressionSetList") Numerical: number of features or genes

pData signature(object = "ExpressionSetList") returns a list of data.frames. The elements of the list correspond to the studies in the ExpressionSetList object.

phenotype signature(object="ExpressionSetList", varLabel="character") Accessor for the clinical variable. Assumes that the clinical variable has the same name in each study.

standardizeSamples signature(object = "ExpressionSetList") See standardizeSamples

studyCenter signature(object = "ExpressionSetList") See studyCenter

zeroNu signature(object = "ExpressionSetList") See zeroNu.

Examples

```r
showClass("ExpressionSetList")
data(expressionSetList)
```

---

ExpressionSetList-methods

Methods for ExpressionSetList

Description

Methods for objects of class ExpressionSetList.

Usage

```r
phenotype(object, varLabel)
```

Arguments

- `object`: A `ExpressionSetList`.
- `varLabel`: character. Name of the clinical variable.

Value

`phenotype` returns a matrix of the clinical variable where each column is a study. We require that the clinical variable have the same name in each study (each element of the `ExpressionSetList` object) and that the clinical variable is binary with values 1 or 0.
firstMcmc

Values for the first MCMC iteration

Description
Accessor method for the values of the first MCMC iteration

Usage
firstMcmc(object)

Arguments
object An object of class XdeParameter

Value
Returns a list of the values to be used in the first iteration of the MCMC.

Author(s)
R. Scharpf

See Also
XdeParameter-class, lastMcmc

Examples

data(expressionSetList)
params <- new("XdeParameter", phenotypeLabel="adenoVsquamous",
esetList=expressionSetList)
str(firstMcmc(params))

---

geneCenter

Center the expression values for each gene in a study to zero

Description
Mean centers the genes for each study in a list

Usage
geneCenter(object)
**Arguments**

- `object` Object of class `ExpressionSetList`

**Value**

Object of class `ExpressionSetList`

**Author(s)**

R. Scharpf

**See Also**

`studyCenter`, `ExpressionSetList-class`

**Examples**

```r
data(expressionSetList)
centered <- geneCenter(expressionSetList)
```

---

<table>
<thead>
<tr>
<th>hyperparameters</th>
<th>Accessor for hyperparameters of the Bayesian model</th>
</tr>
</thead>
</table>

**Description**

Accessor and replacement methods for hyperparameters of the Bayesian model are provided

**Usage**

```r
hyperparameters(object)
```

**Arguments**

- `object` An object of class `XdeParameter`

**Details**

See the `XdeParameterClass` vignette for a more detailed discussion. The default values provided when initializing an object of class `XdeParameter` works well in most instances.

**Value**

A numerical vector

**Author(s)**

R. Scharpf
iterations

References

R. Scharpf et al., A Bayesian Model for Cross-Study Differential Gene Expression, Technical Report 158, Johns Hopkins University, Department of Biostatistics, 2007

Examples

data(expressionSetList)
xlist <- new("XdeParameter", esetList=expressionSetList, phenotypeLabel="adenoVsquamous")
hyperparameters(xlist)

<table>
<thead>
<tr>
<th>iterations</th>
<th>Number of MCMC iterations</th>
</tr>
</thead>
</table>

Description

Number of MCMC iterations

Usage

iterations(object)

Arguments

object An object of class XdeParameter or XdeMcmc.

Details

For an object of class XdeParameter, iterations specifies the total number of MCMC iterations. Note that by setting the thin parameter to a value greater than 1, the number of MCMC iterations will be greater than the number of saved MCMC iterations (saved iterations = iterations / thin).

For an object of class XdeMcmc (a class that stores output from the MCMC), iterations specifies the number of iterations that were saved.

The replacement method is only defined for the XdeParameter class. The class XdeMcmc is meant to reflect the information in an already run chain, whereas XdeParameter is a class for parameterizing the Bayesian model that has not yet been fit.

Value

An integer

Author(s)

R. Scharpf

See Also

XdeParameter-class, XdeMcmc-class
lastMcmc

MCMC values for the last iteration

Description

MCMC values for the last iteration. Useful if more iterations are needed.

Usage

lastMcmc(object)

Arguments

object Object of class XdeMcmc

Value

An environment.

Author(s)

R. Scharpf

See Also

firstMcmc

Examples

## Not run:
data(expressionSetList)
xparam <- new("XdeParameter", phenotypeLabel="adenVsquamous", 
esetList=expressionSetList)
iterations(xparam) <- 10
fit <- xde(xparam, esetList=expressionSetList)
##Do more iterations and use a different seed
firstMcmc(xparam) <- lastMcmc(fit)
seed(xparam) <- 97814
fit2 <- xde(xparam, esetList=expressionSetList)

## Or
fit2 <- xde(xparam, esetList=expressionSetList, outputMcmc=fit)

## End(Not run)
options for storing results of the MCMC chains

Description
A numeric vector indicating which chains to write to file and, for those parameters that are written to file, how often the chains should be written to file.

Usage
output(object)

Arguments
object An object of class XdeParameter or XdeMcmc

Details
Replacement methods are only available for objects of class XdeParameter. Accessor methods are available for objects of class XdeParameter and XdeMcmc.

Value
A named numerical vector. The first element (thin) specifies how often to write chains to file. For instance, if output[1]=2 the chains will be written to file every other iteration. Elements 2 - 22 of the vector are indicators for whether to write the the chains of the Bayesian parameters to file.

Note
Parameters indexed by gene and study (Delta, Phi, Nu, and sigma2) grow very large quickly.

Author(s)
R. Scharpf

output(xmcmc)
pairs-methods

Description

A convenient wrapper for pairs that uses smoothScatter to plot the density of the points and displays
the spearman correlation coefficient of the pairwise scatterplots.

Methods

\texttt{x = "matrix"} Typically a matrix of effect size estimates obtained in each study. Rows are genes,
columns are studies.

\texttt{x = "data.frame"} Typically a data.frame of effect size estimates obtained in each study. Rows
are genes, columns are studies.

Parameters-class

Description

Container for XDE parameters

showClass("Parameters")

**Description**

Accessor and replacement methods for objects of class `XdeMcmc` for posterior averages of differential expression.

**Usage**

```r
posteriorAvg(object)
posteriorAvg(object) <- value
```

**Arguments**

- `object`: Object of class `XdeMcmc`
- `value`: A matrix of dimension G x 3, where G is the number of genes and 3 are different ways of quantifying differential expression in the context of multiple studies (concordant, discordant, or the union).

**Value**

A matrix of dimension G x 3, where G is the number of genes and 3 are different ways of quantifying differential expression in the context of multiple studies (concordant, discordant, or the union).

**Author(s)**

RS

**See Also**

- `calculatePosteriorAvg`

---

**seed**

**Seed for the MCMC**

**Description**

Setting a seed is useful for reproducing MCMC chains.

**Usage**

```r
seed(object)
seed(object) <- value
```
**ssStatistic**

**Arguments**

- **object**
  - An object of `XdeParameter` or `XdeMcmc`

- **value**
  - Numeric or integer

**Details**

The seed stored in the slot of an object of class `XdeParameter` and an object of class `XdeMcmc` are useful in different ways. For the `XdeParameter` class, the seed indicates what seed was used to initialize an MCMC chain. By contrast, an object of class `XdeMcmc` contains a seed that would be useful for running additional iterations – the seed here is guaranteed to be different from the seed that was used to initiate the MCMC.

**Value**

An integer

**Author(s)**

R. Scharpf

---

**ssStatistic**

*Calculate single study estimates of effect size*

**Description**

Calculate single study estimates of effect size for lists of ExpressionSets

**Usage**

```r
ssStatistic(statistic = c("t", "sam", "z")[[1]], phenotypeLabel, esetList, ...)
```

**Arguments**

- **statistic**
  - Character string indicating Welch t-statistic (t), SAM (sam), or a z-statistic (z)

- **phenotypeLabel**
  - Character string indicating the name of the binary covariate

- **esetList**
  - An object of class `ExpressionSetList`

- **...**
  - Not implemented. Potentially additional arguments to the above methods that are implemented in other packages
standardizeSamples

Details

This function is a wrapper that provides an estimate of effect size for each study (element) in an ExpressionSetList object.

For Welch t-statistic, this function is a wrapper for mt.teststat in the multtest package.

For SAM, this function is a wrapper for the sam function in the siggenes package.

The "z" statistic is a standardized unbiased estimate of effect size (Hedges and Olkin, 1985) – implementation is in the zScores function in the R package GeneMeta.

See the complete references below.

Value

A matrix: rows are genes and columns are studies

Author(s)

R. Scharpf

References

Y. Ge, S. Dudoit & T. P. Speed (2003), Resampling-based multiple testing for microarray data hypothesis Test 12(1) : 1-44 (with discussions on 44-77).

Examples

data(expressionSetList)
if(require(siggenes)){
    sam <- ssStatistic("sam", esetList=expressionSetList, phenotypeLabel="adenoVsquamous")
}

standardizeSamples Centers the genes at zero and standardizes the samples to have variance 1

Description

For each study (element) in an ExpressionSetList object, this function centers the genes to have mean zero (rows) and scales the variance of the samples to 1.
studyCenter

Usage

standardizeSamples(object, ...)

Arguments

object Object of class ExpressionSetList
... Additional arguments not implemented

Value

An object of class ExpressionSetList

Note

Requires genefilter package

Author(s)

R. Scharpf

studyCenter Center the expression values in a study to zero

Description

Centers each study in a list so that the average expression value of each study is zero

Usage

studyCenter(object)

Arguments

object An object of class ExpressionSetList

Value

An object of class ExpressionSetList

Author(s)

R. Scharpf

See Also

geneCenter, ExpressionSetList-class
symbolsInteresting

Examples

```r
data(expressionSetList)
centered <- studyCenter(expressionSetList)
lapply(centered, function(object) round(mean(exprs(object)), 4))
```

symbolsInteresting

*Useful for changing the look of pairs plots to emphasize concordant or discordant genes*

Description

This function can be used to order genes in a matrix by the rank of a statistic and provide different plotting symbols and colors for genes that exceed a certain threshold of the ranking statistic.

Usage

```r
symbolsInteresting(rankingStatistic, percentile = 0.9,
                  colors = c("grey50", "royalblue"),
                  symbols = c(".", "o"), size = c(3, 1),
                  background = c("white", "grey70"))
```

Arguments

- `rankingStatistic`: Any numerical vector
- `percentile`: A percentile of the rankingStatistic – above which a gene would be classified as 'interesting'
- `colors`: character string of length 2: a color for genes not exceeding the percentile and a color for genes exceeding the threshold
- `symbols`: two plotting symbols (numeric or character): symbol for genes not exceeding percentile and symbol for genes exceeding percentile
- `size`: numeric vector of length 2: size of plotting symbol for genes not exceeding percentile and size of plotting symbol for genes exceeding percentile
- `background`: character vector of length 2: background color of plotting symbols for gene not exceeding percentile and for genes exceeding the percentile

Value

- `order`: the order of the rankingStatistic
- `pch`: plotting symbols (same length as rankingStatistic)
- `col`: color of plotting symbols (same length as rankingStatistic)
- `bg`: background color of plotting symbols (same length as rankingStatistic)
- `cex`: size of plotting symbols (same length as rankingStatistic)
thin

Author(s)

R. Scharpf

Examples

data(expressionSetList)
data(xmcmc)
pathToLogFiles <- system.file("logFiles", package="XDE")
load(file.path(pathToLogFiles, "BES.rda"))
load(file.path(pathToLogFiles, "postAvg.rda"))
op.conc <- symbolsInteresting(rankingStatistic=postAvg[, "concordant"])
graphics:::pairs(BES[op.conc$order, ], pch=op.conc$pch, col=op.conc$col,
               bg=op.conc$bg, upper.panel=NULL, cex=op.conc$cex)

thin  How often to write MCMC iterations to file

Description

A value greater than one means that not every MCMC iteration is written to file.

Usage

thin(x, ...)

Arguments

x  An object of class XdeParameter

... not implemented

Details

thin is an accessor for the first element in the vector returned by the method output.
The replacement method replaces the first element in the output vector.

Value

An integer.

Author(s)

R. Scharpf

See Also

output
**tuning**

Tuning parameters for Metropolis-Hastings proposals

**Description**

Accessor and replacement methods for tuning the Metropolis-Hastings proposal parameters.

**Usage**

tuning(object)

**Arguments**

object Object of class XdeParameter

**Details**

See the XdeParameterClass vignette

**Value**

A numerical vector

**Author(s)**

R. Scharpf

**updates**

Frequency of updating a parameter per MCMC iteration

**Description**

Accessor and replacement methods for the class XdeParameter are available. Specifying an update of integer N for a Metropolis-Hastings parameter means that N values are proposed for that parameter for each MCMC iteration.

**Usage**

updates(object)

**Arguments**

object An object of class XdeParameter

**Details**

See the XdeParameterClass vignette
**Value**

A numerical vector

**Author(s)**

R. Scharpf

---

**Value**

Object of class XdeMcmc

---

**Description**

Fits the Bayesian hierarchical model for cross-study differential gene expression.

**Usage**

```r
xde(paramsMcmc, esetList, outputMcmc, batchSize=NULL, NCONC=2, center=TRUE, ...)
```

**Arguments**

- `paramsMcmc`: Object of class XdeParameter
- `esetList`: Object of class ExpressionSetList
- `outputMcmc`: Object of class XdeMcmc (optional)
- `batchSize`: Integer or NULL. The number of iterations written to log files before summarizing the chain and then removing. Experimental.
- `NCONC`: The number of studies for which a gene must be differentially expressed in the same direction to be considered as concordantly differentially expressed.
- `center`: Logical. If TRUE, each study is centered to have mean zero.
- `...`: Additional arguments passed to `xdeFit`.

**Details**

Details for fitting the Bayesian model are discussed elsewhere (see citation below and XdeParameterClass vignette)

If an integer is specified for the `batchSize`, summary statistics for the log-files are calculated for every `batchSize` iterations. The log files are then removed and the next iteration will start a new log file. This allows one to do many iterations without creating enormous log files. This is only reasonable to do if one has already assessed convergence.

**Value**

Object of class XdeMcmc
XdeMcmc-class

Class for storing output from the Bayesian model

Description
Stores output, including the last iteration of the MCMC.

Objects from the Class
Objects can be created by calls of the form new("XdeMcmc", studyNames, featureNames, iterations, seed, output, directory, lastMcmc, posteriorAvg, bayesianEffectSize).

Slots

Container class for storing options of the Bayesian hierarchical model

Description

This class contains initial values for the first iteration of the MCMC, options for saving MCMC chains, options for changing the tuning parameters of the Metropolis-Hastings algorithm, options for changing hyperparameters from their defaults, etc.

Objects from the Class

Objects can be created by calls of the form new("XdeParameter", esetList, updates, tuning, hyperparameters, output, iterations, burnin, seed, randomSeed, genes, studies, firstMcmc, specifiedInitialValues, directory, phenotypeLabel, seed, showIterations, verbose, studyNames, one.delta).

Slots

updates: Object of class numeric. The frequency of updates for each iteration of the chain.
tuning: Object of class numeric. Tuning parameters for the Metropolis-Hastings proposals hyperparameters: Object of class numeric. Hyperparameters for the Bayesian hierarchical model output: Object of class numeric. Indicator for whether to save the MCMC chain to file. If the value is zero, the chain is not saved.
iterations: Object of class numeric. The total number of MCMC iterations.
burnin: Object of class logical. If set to FALSE, by default none of the chains will be saved (called for its side-effect of setting the output to zero for each parameter).
notes: Object of class character.
firstMcmc: Object of class environment. Values for the first iteration of the MCMC seed: Object of class integer. Seed used for simulating random numbers.
showIterations: Object of class logical. Whether to show the MCMC iteration when fitting the model
specifiedInitialValues: Object of class logical. If TRUE (the default), the values stored in firstMcmc will be used for the first iteration of the MCMC.
directory: Object of class character. Specifies where to write the log files
phenotypeLabel: Object of class character. The name of the binary covariate used for differential expression
verbose: Object of class logical
studyNames: Object of class character. Names of the datasets
one.delta: Logical. If TRUE, a gene is assumed to be differentially in all studies or none of the studies.
Methods

burnin signature(object = "XdeParameter") logical. See burnin

burnin<- signature(object = "XdeParameter", value = "logical") logical. See burnin

directory signature(object = "XdeParameter") character string giving the path or relative path to store log files from the MCMC chain

directory<- signature(object = "XdeParameter") Path to store log files.

firstMcmc signature(object = "XdeParameter") See firstMcmc

firstMcmc<- signature(object = "XdeParameter", value = "environment")

firstMcmc<- signature(object = "XdeParameter", value = "list")

hyperparameters signature(object = "XdeParameter") See the XdeParameterClass vignette

hyperparameters<- signature(object = "XdeParameter") See the XdeParameterClass vignette

initialize signature(.Object = "XdeParameter") Method for initializing an instance of the class.

The default values provided work well in most cases.

iterations signature(object = "XdeParameter") Accessor for the total number of MCMC iterations to run

iterations<- signature(object = "XdeParameter", value = numeric) The replacement method is useful for setting a different number of iterations.

iterations<- signature(object = "XdeParameter", value = "integer")

output signature(object = "XdeParameter") See also output. This method is also defined for class XdeMcmc

output<- signature(object = "XdeParameter") See also output

phenotypeLabel signature(object = "XdeParameter") The name of a binary covariate present in each study

phenotypeLabel<- signature(object = "XdeParameter", value = "character")

savedIterations signature(object = "XdeParameter") The number of MCMC iterations written to file. It is the value of the total number of iterations divided by the thinning parameter. See also output

seed signature(object = "XdeParameter") See seed

seed<- signature(object = "XdeParameter", value = "integer") Replacement method. See also seed.

show signature(object = "XdeParameter") Produces a short summary of objects that are instances of the XdeParameter class

showIterations signature(object = "XdeParameter") logical

showIterations<- signature(object = "XdeParameter")

studyNames signature(object = "XdeParameter") Names of the high-throughput gene expression studies

studyNames<- signature(object = "XdeParameter")

thin signature(x = "XdeParameter") See output and thin

thin<- signature(x = "XdeParameter", value = numeric) See thin

tuning signature(object = "XdeParameter") See also tuning

tuning<- signature(object = "XdeParameter")

updates signature(object = "XdeParameter") See also updates

updates<- signature(object = "XdeParameter")

Examples
showClass("XdeParameter")
## See the XdeParameterClass vignette

data(xmcmc)

## ordinarily, one should not need to change the directory in an object
## of class XdeMcmc -- therefore, a replacement method is not defined
pathToLogFiles <- system.file("logFiles", package="XDE")
xmcmc@directory <- pathToLogFiles

## The $ operator can be used to extract chains. For instance, here we
## extract the c2 chain
c2 <- xmcmc$c2
plot.ts(c2)
**xsScores**

**Alternative cross-study scores of differential expression**

---

**Description**

Alternative cross-study scores of differential expression

**Usage**

```
xsScores(statistic, N)
```

**Arguments**

- `statistic` a matrix of study-specific estimates of effect size. Rows are genes and columns are studies.
- `N` numerical vector: the number of samples in each study (the length should be the number of columns in `statistic`)

**Value**

A matrix of cross-study scores for differential expression ("diffExpressed"), concordant differential expression, and discordant differential expression.

**Author(s)**

R. Scharpf

**See Also**

the GeneMeta package, `ssStatistic`

**Examples**

```r
data(expressionSetList)
t <- ssStatistic(statistic="t", phenotypeLabel="adenovsquamous", esetList=expressionSetList)
tScores <- xsScores(t, N=nSamples(expressionSetList))```
zeroNu

Option for not modeling Nu

Description
 Nu is the average expression value in each study.

Usage
    zeroNu(object, ...)

Arguments
 object          object of class ExpressionSetList
 ...             Not implemented

Details
 This function should be regarded as experimental.

The nu parameter models the average expression value in each study. Modeling nu allows one to estimate differential expression across studies that may differ in location and scale (as often occurs when multiple platforms are used). The price to pay for modeling nu are additional assumptions (the nu's are assumed Gaussian) and a more heavily parameterized model.

The method zeroNu allows one to fit the Bayesian model without estimating nu:
- each gene is centered at zero
- initial values for the first MCMC are chosen on the basis of empirical starting values
- the initial values for a and rho are set to zero.
- the nu, a, gamma2, and rho parameters are not updated during MCMC

Value
 object of class XdeParameter
